The Chairman said that in the report they had tried to set out the facts, and it was no doubt a very satisfactory one. There were one or two things in the history of the company which he should like to mention. Some four years ago his friend Mr. Hopkins conceived the idea that there was room for a company to take up electric traction business, and with a few friends they started a company, which carried out schemes at Coventry and Douglas. So many matters, however, were submitted, that Mr. Hopkins communicated with him (the Chairman) with a view to enlarging the company's sphere. There appeared to be good business in it, and he (the Chairman) was glad to join with Mr. Hopkins in promoting his efforts. They began in a small way, and went on quietly, for they knew if good business could be secured they could put their hands on the capital to carry it out. They succeeded in getting Acts of Parliament for Norwich and for extensions at Coventry. They had been able to issue £100,000 in preference shares, and this was small for the operations they contemplated, but no doubt they would be asking the public for money later on. They regarded it necessary to move with caution, and to secure good business, and they were anxious to work in harmony with the corporations with which they were thrown in contact. It was not the amount of business but the good business which paid them. After referring to the backward state of electric tramways in this country, the chairman said he had no fear for the future. Their gross profits for last year had been £12,874; the undivided profit of the old company, amounting to £2,230, had been placed to reserve, and half the cost of issuing the new capital (£2,122) had been charged against current revenue. A dividend of 6 per cent. on the preference capital had been paid, and the balance would be carried forward.

The report was adopted.

West India and Panama Telegraph Company.

The ordinary general meeting of the West India and Panama Telegraph Company, Limited, was held at Winchester House on Wednesday, Mr. Wm. Andrews presiding.

The Chairman said that the receipts for the half-year had been £32,228, as compared with £34,053, showing a decrease of £2,000. Last year the French cable was interrupted, and that brought extra business; but, on the other hand, the disastrous state of trade in the West Indies, which had recently been intensified, had been an adverse influence. The expenditure had been £19,772, against £21,398 in the corresponding half-year, showing a decrease of £1,626. The reduction was not due to decrease of expenses, but to a smaller quantity of cable being used on the line. Owing to the falling off of receipts it had been necessary to transfer from the reserve fund £1,000 to enable them to make up the difference for the dividend. He apprehended there was no danger in that, seeing the increased value of their investments. With respect to the current period, he was sorry to tell the shareholders that, owing to the financial crisis in Antigua and St. Kitts, the subsidy had been reduced from £800 to £600. Then the subsidy of £2,000 per annum paid by the island of Jamaica had been discontinued from March 31st last, and he believed that the amount would in future go to the Bermuda and Jamaica Company. The shareholders had previously been informed, at the last meeting, of the necessity of a partial renewal of the line between Trinidad and one of the northern islands, so as to maintain the duplication of the system. They had succeeded in saving a certain mileage by the new cable. The Cuba Company had objected to them receiving messages at Jamaica for Eastern stations, and had threatened to take proceedings against them. The directors were advised they had a good case. As to the reductions in their rates, Mr. Chamberlain had made an announcement that the Government would give some support to the West Indies, and the directors, with that statement in view, thought they might also, in a small way, help the West Indies by making a reduction in the price of telegrams, and giving more facilities. He could not state the exact effect of the reductions on the revenue, but the falling off had not been much more than they anticipated, and latterly their revenue had increased, but this was consequent, probably, upon the number of messages sent over their line owing to the lamentable war between Spain and America. In anticipation of interruptions which might take place in their cables, they had taken steps to prevent interference, but in a time of war, as the shareholders knew, private, and sometimes public, interests were bound to go to the wall. They were keeping a ship on the spot in order to keep the system going.

In reply to a shareholder asking if there was still communication with Cuba, the Chairman said he did not want to define too clearly where the line might be interrupted, but they were still going on.

The report was adopted.

Mix & Genest, Limited.

On Monday, May 16th, the annual general meeting of the shareholders of Messrs. Mix & Genest, Limited, of Berlin, was held at their board room at 67, Bulow Strasse, when the directors submitted their report, recommencing a 10 per cent. dividend for the year 1897. The gross profit earned amounts to £25,000, which, after deducting expenses, and writing off £3,200 on tools and machinery, leaves a net profit of £13,570. The chairman informed the shareholders that business has been very brisk during the past year, necessitating a further extension of their newly-built factory, which up to now accommodated 1,000 hands, and which, with the additional premises, will allow of the employment of 1,500 hands. The directors state that the number and amount of Government and trade orders generally in hand are again in excess of last year's figures, and a further development can be prognosticated.

African Trans-Continental Telegraph Company, Limited.

Mr. Cecil J. Rhodes presided at a meeting of this company held yesterday at the offices of the company, 15, St. Swithin's Lane, E.C.

In speaking of the progress made by the company, the Chairman said they had gone from Umtali to Tete, and from Fort Johnson to Bandawe, and in about 15 months they expected to have carried the telegraph line to the south of Lake Tanganyika. They had had great difficulties with the line, and had abandoned the route from Salisbury to Tete, and carried the system from Umtali to Tete. The undertaking had been more expensive than was anticipated, and they had made arrangements with the directors of the Chartered Company to subscribe money to complete the line. They could not expect to make any profit till they got through to Cairo, for he did not think the local returns would pay. General Kitchener would reach Khartoum in October, and then it would be possible to carry their lines to Cairo. From Tanganyika to Uganda was only 600 miles, and from there to Cairo was 1,400 miles, and it was contemplated this could be completed in five years. The system would then enable them to send practically the whole of the African messages to London. If the cable company's charges were too excessive, they could lay an alternative cable. He thought the Government would undertake the expense of joining Khartoum by telegraph, which would not cost more than £120,000. After some further remarks the chairman proposed the adoption of the report, which was seconded by Earl Grey, and carried unanimously.

An extraordinary meeting was then held, when a resolution to increase the capital of the company to £300,000 was adopted.

Hobart Electric Tramway Company.

The report of the directors of the Hobart Electric Tramway Company, Limited, for the year 1897, which was submitted to the annual general meeting held at the registered offices on Friday last, states that the gross takings amounted to £12,380, and the working expenses to £8,853, and after deduction of debenture interest, administration, and other expenses in Hobart and London, the company has made a net profit of £301 for the year. The directors continue to receive assurances that the service provided by the line is much appreciated. The number of passengers carried by the tramway since the opening of the line in September, 1893, to September 30th last is 5,349,450, and the total number of car miles run is 1,336,157. The directors continue to receive from Mr. Parker, the company's general manager in Hobart, very complete weekly and monthly reports as to the working of the company's business, and are glad to be assured by him that the plant and rolling stock remain in an efficient condition.

The City of London Electric Lighting Company, Limited.—Return of gross revenue from supply of electricity only during quarter ended March 31st, 1898:—Gross revenue from public lighting, quarter ended March 31st, 1898, £3,162: corresponding quarter last year (under old rate of charges), £3,182. Gross revenue from private lighting, &c., less allowances to customers under reduced price and sliding scale, quarter ended March 31st, £52,132; corresponding quarter last year (under old rate of charges), £49,843; total, quarter ended March 31st, £55,294; total, corresponding quarter last year (under old rate of charges), £53,025; increase, £2,269. Equivalent of 8-C.P. lamps connected on March 31st, 1898, 310,660; increase during quarter, 14,648. Equivalent of 8-C.P. lamps connected on March 31st, 1897, 260,936: increase during corresponding quarter last year, 13,151.

New Motive Power Company.—A meeting of this company was held on Thursday at the Holborn Viaduct Hotel, but the press were not admitted. The directors' report stated that Mr. Guattari, the inventor, has settled in Belgium, and has failed to keep his promises to return to this country.

TRAFFIC RECEIPTS.

The Bristol Tramways and Carriage Company, Limited.—The receipts for the week ending May 13th, 1898, were £2,648 6s. 7d.; corresponding period 1897, £2,288 1s.; increase, £360 5s. 7d.

The City and South London Railway Company.—The receipts for the week ending May 15th, 1898, were £958; week ending May 16th, 1897, £1,000; decrease, £42; total receipts for half-year, 1898, £20,679; corresponding period, 1897, £20,503; increase, £176.

The Dublin Southern District (Electric) Tramways Company.—The receipts for week ending Friday, May 13th, 1898, were £528 0s. 6d.; corresponding week last year, £531 6s. 11d.; decrease, £3 6s. 5d.; passengers carried, 84,256; corresponding week last year, 95,616; aggregate to date, £8,357 17s. 9d.; aggregate to date last year, £8,697 17s. 11d.; decrease to date, £340 0s. 2d.; mileage open, 8 miles.

The Liverpool Overhead Railway Company.—The receipts for the week ending May 15th, 1898, amounted to £1,446; corresponding week last year, £1,352; increase, £94.

The Western and Brazilian Telegraph Company, Limited.—The receipts for the week ending May 13th, 1898, after deducting 17 per cent. of the gross receipts payable to the London Platino-Brazilian Telegraph Company, Limited, were £1,985.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

THE PREVENTION OF INTERRUPTIONS TO ELECTRICITY SUPPLY. By LEONARD ANDREWS, Associate. Read May 5th, 1898.

It is probable that some central station engineers will remark, on reading the title of this paper, that it is several years behind the times; that interruptions to the supply from a properly equipped modern station never now occur; that at their own particular stations the supply has never once been interrupted since it was started, &c.

It speaks volumes for the progress of electrical engineering during the past few years that there are several existing central stations that can show an absolutely clean sheet in this respect since their commencement, and everyone will agree that their engineers hold a very enviable position. It is very doubtful, however, if any of them can say that they have not a consumer connected to their mains who has during the past 12 months ever had his supply disconnected; and, if that is so, surely there is still sufficient room for improvement to make the matter worth discussing. After all, it is these local interruptions that are so irritating to consumers. Our experience has been that we get far more abuse from a consumer whose lights fail when his neighbour's lights are burning satisfactorily than we do if they are both suffering together.

Some of the engineers who have achieved such an excellent record attribute their immunity from failures to the fact that they use fuses made of copper of the same sectional area as the mains. There can be no doubt that a large majority of the interruptions that do occur are caused by fuses blowing when they have no business to do so. Yet it does seem rather risky to use no safety devices at all. We have already heard of more than one case where an arc of a few thousand horse-power has been started under the pavement, and would not be quieted until the supply had been switched off from the works. On the other hand, when one remembers upon what a number of fuses the continuity of an average consumer's supply is dependent, it is really wonderful that he is not more often left in darkness. It is no exaggeration to say that there are often from 15 to 20 fuses between the generators and the lamps they supply. Is it, then, to be wondered at that we are so often told that electricity supply is not to be relied upon? It would be different if we could always depend upon fuses blowing at approximately the current they are set for. But we cannot. It is no uncommon case to take two similar fuses that have been in use for some months and find that one requires about 100 per cent. more current to blow it than does the other. The fuses used on alternate current circuits appear to be particularly erratic in this respect.

The ELECTRICAL REVIEW drew attention to this fuse trouble in one of its leading articles a few months ago. Still more recently, Mr. W. B. Sayers, in an article in *Lightning* on the subject, says:—

"In a city less than 100 miles from where I live there is an electricity works which, so far as I am aware, has not failed to maintain its supply for a single minute during the last 4 or 5 years; and yet the popular belief that the 'electric light is not reliable' is maintained to this day, and with good reason. . . . . Now the only proper cause, in my opinion, for a main fuse 'blowing' is a short-circuit on the mains, and yet I have no hesitation in saying that less than 1 per cent. of the cases of main fuses 'blowing' are due to this cause."

The conclusion that we have come to at Hastings is that the only reliable conductor of electricity appears to be a copper cable; and, consequently, it seems advisable to reduce all fuses, switches, safety devices, and mechanical connections of any description to a minimum.

If any fuses that it is customary to use can be omitted, everyone will admit that they are a source of danger, and, consequently, better omitted. Take, for instance, the fuses between alternate-current generators and the bus bars: what are they used for? They cannot be necessary to protect the machines from being overloaded, because all modern makers claim that their machines may be short-circuited with impunity. Presumably they are intended to prevent a generator that fails, short-circuiting other machines working in parallel with it; but everyone knows that if two or three machines of an equal output, and equally fused, are working together, it would be the fuses of the healthy generator that would blow, and not those of the faulty one, because the former have to carry sufficient current to blow the latter, in addition to all the useful work on the mains at the time.

Now what should we think of an omnibus driver who cut the traces of one of his horses because it attempted to do more than its share of the work, or who, when one of them fell down dead, made the remaining horse drag the dead one along in addition to the extra work thrown upon it by the decease of its comrade? This sounds absurd, but it practically represents the manner in which we alternate-current station engineers have been educated to treat our machines; for are we not taught carefully to equip them with safety devices to cut them out of circuit just at the time when all their energies are required to burn out a short-circuit on the mains? whereas any device to prevent a failing machine from short-circuiting others is considered quite an unnecessary piece of apparatus.

In continuous-current stations zero cut-outs, or discriminating cut-outs, are generally used in preference to excess-current cut-outs —the word "discriminating" being used to designate a cut-out that operates only when the current is flowing through it in a reverse direction to its normal.

Magnetic cut-outs of any description have not hitherto been looked upon with much favour in this country. The majority of those now in use require too careful and delicate treatment to be popular. Only people who have attempted to design a simple and trustworthy discriminating cut-out can realise the number of difficulties that have

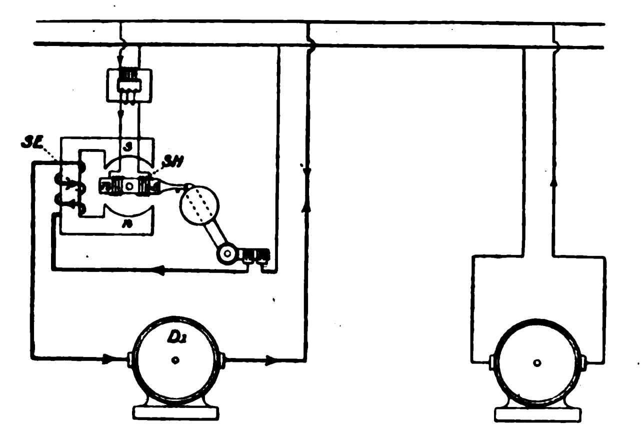

FIG. 1.

to be overcome in doing so. It is easy enough to make an apparatus that will operate under certain specific conditions in the workshops, but it is a very different matter to construct a cut-out that can be relied upon to open the circuit of a failing generator with a very small return current, and that can be guaranteed never accidentally to operate at any time when it is not required to do so. In the first place, the sectional area of the winding must be large enough to carry the maximum current of the generator without undue heating; at the same time the apparatus must be small and compact, consequently the turns must be few; and, finally, it must operate with a return current of only a small percentage of the maximum current, therefore the ampere-turns or magnetising force must be small.

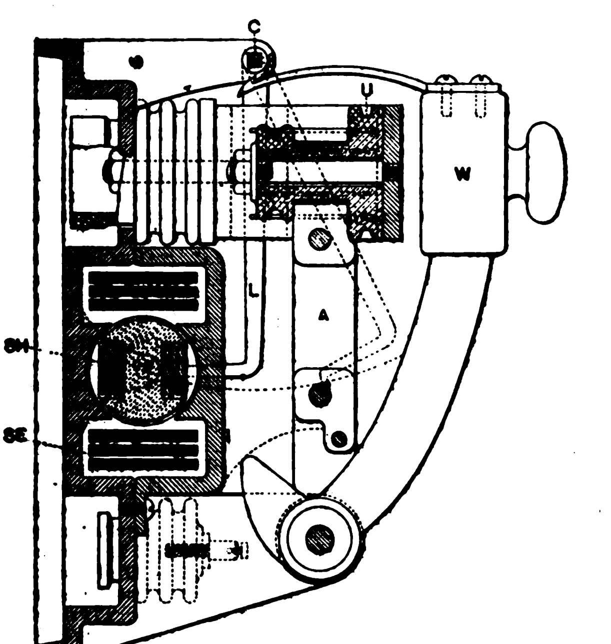

FIG. 2.

This generally involves the use of delicate releasing mechanism or relays, which require careful treatment, or they will operate at the wrong time, and not when a failure occurs. These are only workshop difficulties. The more serious are those which confront us when the apparatus is in use under actual working conditions.

Take, for instance, the case of zero magnetic cut-outs Everyone knows that these can be made to operate only when the current falls below a predetermined amount; and yet it is also well known that if a short-circuit occur on a system of mains supplied by a number of generators equipped with zero cut-outs, several of the generators will be promptly cut out of circuit. This is simply a specimen of the many troubles which it is impossible to forsee and guard against in the manufacturer's workshop.

Between three and four years ago we realised that a reliable discriminating cut-out was badly wanted, and since that time considerably over 100 different combinations of compound windings and releasing mechanisms have been experimented with. Many of these have only reached the experimental stage, but a fair proportion have had several months' actual use under working conditions before some unforeseen difficulty made it necessary to scrap them for some new and improved arrangement. The result has been that we have at last been able to secure a cut-out that appears to be perfect.

It appears at first sight impossible to design a satisfactory discriminating cut-out for use in connection with alternate current machines in which the current is reversing in direction some thousand times a minute. So long as one considers these reversals in relation to a constant polarity, it is, of course, impossible; but as soon as the direction of the current through a particular machine is considered relatively to the direction of the current in all other parts of the system, the problem becomes a comparatively simple one. *Fig.* 1 illustrates diagrammatically what we have found to be the most satisfactory method of applying this principle. The operating device in this arrangement is practically a shunt-wound motor, the thick

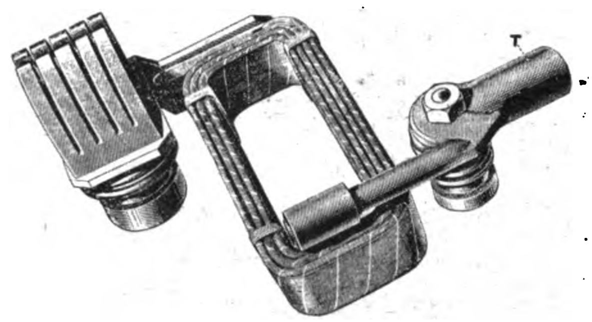

FIG. 3.

winding of which is connected in series with one of the leads from the alternator it is intended to control, and the shunt winding is connected across any transformer excited off the bus bars. Now it is obvious that the direction of the current in the shunt winding, S H, will pulsate synchronously with the current in the bus bars, and will be quite independent of the direction of the current in the series winding, S E, whereas the direction of the current in the latter relatively to the current in the bus bars will depend upon whether the machine to which it is connected is generating current or is being driven as a motor. If both machines are generating current, then the direction of the current throughout the whole system at a given moment will be represented by the arrow-heads shown full. But if, say, alternator D_1 fails, it will tend to short-circuit the rest of the system, and the current will rush back into it in the direction shown by the dotted arrow-heads, whereas the direction

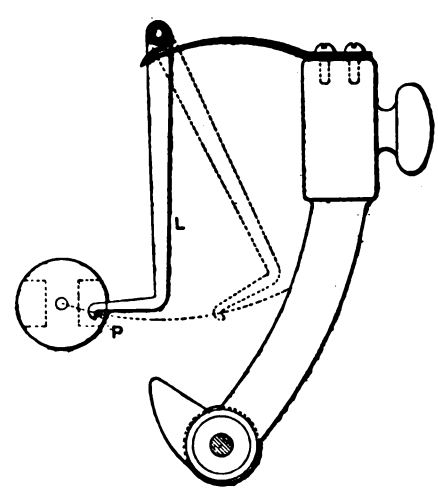

FIG. 4.

of the current in the other circuits will remain the same. In the former case the relative direction of the shunt winding to the series winding in the cut-out device will be such as to tend to make the armature rotate in a clock-wise direction, and so to lock the switch securely; but when, as in the latter case, the direction of the series current relatively to the shunt current is reversed, the armature will rotate in a contra-clockwise direction, and so open the circuit.

Fig. 2 is a sectional elevation of a mechanical application of this principle to a low-tension cut-out suitable for use with continuous-current generators, transformers, and low-tension mains. The weight, W, is held in a nearly vertical position by the catch, C. Attached to the catch is a lever, L, the free end of which engages in a pin projecting from a metal disc on the end of the armature, S H.

The series winding, S B, consists of a few turns of thick copper tape wound directly round the armature. One end of this is sweated and riveted directly on to a brass plate screwed and sweated to one of the contacts, and the other end is sweated on to a thimble, T (fig. 3), which forms one of the series terminals. The other series terminal is screwed and sweated directly on to the second contact. The whole of the series connections and contacts are supported on three corrugated porcelain insulators sulphured into the base. Fig. 3 shows these series connections removed from the rest of the cut-out. This series winding encloses a practically closed double magnetic circuit, consisting of the armature core, a portion of the base, and the cast-iron covers. For alternate-current working these parts are, of course, laminated.

An important feature of this cut-out is the releasing catch. This is shown in detail in fig. 4. The pin, P, is fixed in such a position on the armature disc that an extension of the arc described by the lever, L, will cut the pin, P, and the centre of the armature disc. The result of this arrangement is that no amount of vibration or pressure applied to the weight, W, will tend to make the disc rotate in either direction. And, consequently, when the armature is rotated by a return current, it releases the weight without having first to lift it, as it would have to do with any other form of catch. We find this an absolutely reliable and extremely sensitive form of release.

When the weight, W, is released it falls through an angle of about 60°, then with a sharp blow it strikes the arm carrying the contact connecting piece, thus overcoming any sticking of the contacts due to a good fit or to corrosion.

A specimen 500-ampere cut-out of this description is shown on the table. You will see that it is so reliable that, even when there is no forward current on to lock it in position, it may be knocked about with a mallet to show that no amount of vibration will release it, whereas it is so sensitive that the pressure of a feather upon the armature will do so.

The same general arrangement without any winding on the armature makes a very sensitive and reliable excess-current cut-out.

(To be continued.)

A Magnetic Balance for Workshop Tests of Permeability. By Prof. J. A. Ewing, F.R.S., Member. Paper read May 12th, 1898.

The author believes that the want is felt of a workshop instrument for making tests, in an easy and rapid fashion, of the magnetic permeability of cast and forged metal for dynamo magnets.

His own permeability bridge,* introduced two years ago, and now somewhat extensively used, allows the B-H curve for a given bar to be determined with very much less trouble than is needed to carry out ballistic tests. For the accurate comparison of one bar with another, throughout a wide range of magnetising forces, the permeability bridge is entirely suitable, and it furnishes as simple a means of performing that operation as can well be had. The author uses it systematically in his own testing, and is thoroughly satisfied with it as a means of determining the B-H curve. But the complete B-H curve is really more than the dynamo builder or the steel founder generally wants to know. For his purpose it would often suffice to find the induction produced by some one (fairly high) value of the magnetising force. That information is a sufficient index of the character of the specimen to allow judgment to be passed on its suitability for use in the field magnets of a dynamo.

These considerations have led the author to develop another testing instrument, which, while it tells less about the specimen than can be learnt by means of the permeability bridge, gives the most useful information in a still more easy way. To use it requires no knowledge of electrical testing, and the results need no working out. The value of the magnetic induction, in the usual units, corresponding to a single stated magnetising force, is directly read off on a divided scale.

The instrument is a magnetic balance of the traction type, making use of the principle already applied in magnetic testing in apparatus designed by Prof. S. P. Thompson, Mr. Gisbert Kapp, and Prof. H. Du Bois. In most apparatus of this kind the specimen has taken the form of a turned bar with a faced end on which the pull due to magnetisation was exerted. In the author's balance this facing of the end is not required, the magnetic pull being exerted between the side of the turned bar and a magnet pole which it touches, and from which it is pulled away. The specimen is a turned rod ½ inch in diameter, and 4 inches long. It lies across the two poles of a U-shaped electro-magnet, which is excited by a constant current of such strength as to produce a magnetising force in the rod of about 20 C.G.S. units. In one of the poles there is a V notch for the bar to rest in, and the other pole has a slightly convex surface, being curved to form a portion of a cylinder with its axis perpendicular to the direction of the length of the rod. The side of the rod touches this pole at one point only, and the tractive force at this point of contact is the force which is measured. A lever or weigh-beam is applied to pull the rod away from this pole, while the other end of the rod remains in the V notch in the other pole, forming what may be called a magnetic hinge. The tractive force is measured by means of a weight which slides along the graduated weight-beam.

When the rod is put in place, the current is reversed once or twice, to wipe out any residual effects of previous magnetisation. The weight is then moved along the beam until the beam just drops each time it is raised, so as to bring the side of the rod into contact with the pole.

The rod requires no preparation beyond turning it to the proper diameter. Its cylindrically turned side touches the convex pole-face in a perfectly definite manner, and the rod may be taken out and put back without altering the character of the contact. The lever is arranged in such a way that the rod always touches the same point of the pole-face.

The value of the magnetising force to be brought to bear on the rods under test was fixed at about 20 C.G.S. units for the following reasons:—

At forces much weaker than this, the B-H curves of different specimens often cross; in other words, the order of merit often changes when the force is varied. But the author's experience in testing dynamo steel leads him to the conclusion that with forces of 20 units and over, there is no serious change in the order of merit of various specimens. If a piece is good when H = 20, it remains good under stronger forces; if it is only fair when H = 20, it remains only fair, and a specimen that has relatively low permeability under this force does not take a materially better place when the force is increased. On the other hand, any considerably stronger force would be less convenient for testing, especially because the difference between good and bad specimens would become less well marked, and the sensitiveness of the test would consequently be reduced. The author has selected 20 as a force which, on the one hand, is sufficiently low to make the distinction wide between bad and good specimens, and on the other hand, is sufficiently high to make the order of merit substantially the same as is maintained under stronger forces.

From the measured induction at H = 20 the probable induction at higher forces can be inferred with some confidence. By examination of the results of tests of a very large number of samples of dynamo steel, including the published tests of Mr. Parshall,* as well as his own tests, the author has prepared the following table, to show the probable approximate values of B at forces of 25, 30, 40 and 50 C.G.S. units, when the value of B at a force of 20 is known. The values of B found for H = 20 range, in dynamo steel, from 16,000 in the very best specimens, down to 12,000 in specimens of decidedly low permeability. About 15,000 is representative of good dynamo steel castings, and anything below 14,000 may be pronounced poor.

Table I.—Probable Values of Magnetic Induction, B for various Amounts of Magnetising Force, H.

Magnetising force, H.	Magnetic induction, B.				
20	12,000	13,000	14,000	15,000	16,000
25	12,700	13,700	14,600	15,500	16,350
30	13,300	14,200	15,100	15,900	16,600
40	14,200	15,000	15,700	16,400	17,000
50	14,900	15,600	16,300	16,900	17,400

The range of the new magnetic balance extends (for H = 20) from 12,000 up to something over 16,000. It will test at the top of its range the very best samples that are found, and at the bottom of the range it will test steel of poorer quality than would be accepted for use in dynamo magnets.

The scale is a linear one, in which equal divisions correspond to equal differences in B, for a constant value of H. It is graduated to give by direct reading the values of B for H = 20. This uniform graduation is arrived at in consequence of the fact that with different specimens the magnetising force is not quite constant, although the current in the electro-magnet is constant. A specimen of high permeability increases the induction in the magnetic circuit, and consequently causes a larger share of the magneto-motive force to be used in that portion of the circuit which lies outside of the specimen itself. Hence the induction in the specimen is less high than its greater permeability would imply; in other words, the better specimen is exposed to a somewhat less magnetising force than the worse specimen is exposed to. The tractive force increases more rapidly than in simple proportion to the actual induction; but matters are so arranged that the lessening of the induction which comes about in the way just stated compensates for this, and the observed differences of tractive force, as measured throughout the range of the scale, stand in simple proportion to the differences in the values of B which the various specimens would exhibit if the force, H, were constant. In other words, a scale of equal parts on the weigh-beam corresponds to equal differences of B under a constant magnetising force, and the weigh-beam is accordingly lettered to read B directly in equal divisions. The readings give B for H = 20, although, in consequence of the action just explained, the actual magnetising force is barely 20 for rods of very good quality, and somewhat exceeds 20 for rods of lesser permeability. The scale is adjusted by the maker by selecting values of the sliding weight and of a fixed weight on the weigh-beam which will bring the readings into agreement with the known values of B in certain standard rods.

A single standard rod is supplied with each instrument, and the observer adjusts his current until the tractive force on that rod is such that the sliding weight stands at the place on the beam corresponding to the known value of B which a force of 20 C.G.S. units produces in that standard. The standard rod consequently serves instead of an ampere-gauge, and no other current measurer is required. A rheostat is provided in the instrument for regulating the current, and a single small storage cell forms the necessary battery. The observer puts in the standard rod, and turns the rheostat until he finds that the weigh-beam just drops each time it is

* Described in the author's paper on "The Magnetic Testing of Iron and Steel," *Min. Proc. Inst. C.E.*, May, 1896. See also the *Electrician*, May 8th, 1896.

* *Min. Proc. Inst. C.E.*, May, 1896.

lifted, while the sliding weight indicates the known value of B. He then puts in the rod which is to be tested, and finds the position which the sliding weight has to take for it, no change being made in the current. The constancy of the current is checked at the end of the tests by again putting in the standard rod.

The complete instrument is shown in the figure (fig. 1). The weigh-beam lifts the rod by means of a V-shaped stirrup close to the pole-piece, from which it is to be pulled away. When the rod is pulled away the beam comes immediately against a stop which limits the motion. A hinged piece is provided under the far end of the weigh-beam, to hold it up while a rod is being taken out or put in. The weigh-beam can readily be lifted out of the way when it is desired to clean the pole-faces, and care has to be taken to keep them, as well as the side of the rod where it touches them, free of dust and rust.

In the following table a comparison is made, for a number of rods of different qualities, of the values of B known to be produced by a magnetising force of 20 units with the values as measured by this magnetic balance. The known values of B were determined by means of the permeability bridge, by comparing each rod with a standard whose B-H curve had been found in the first instance by ballistic tests. The range covered by these examples is as wide as is likely to be met with in the practical testing of dynamo steel.

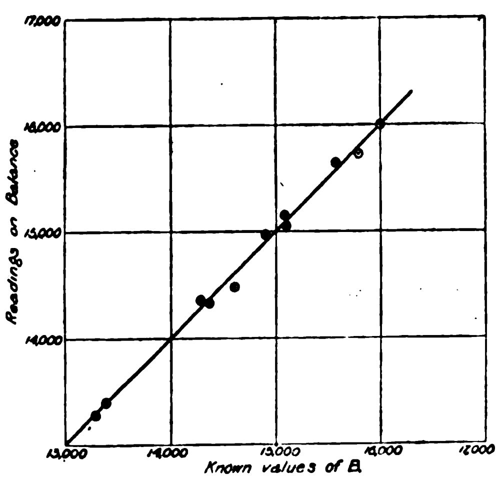

FIG. 2.

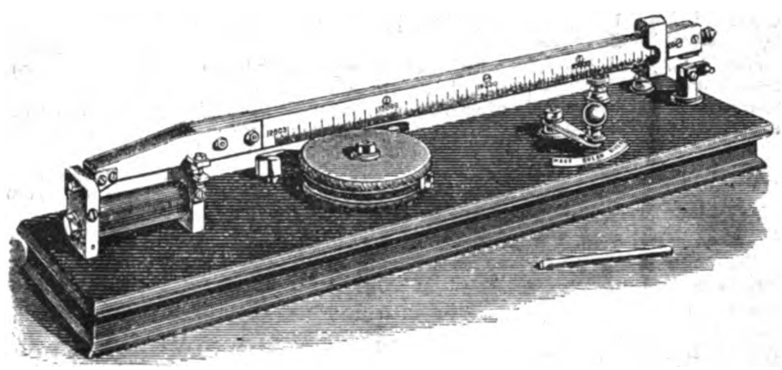

FIG 1.

TABLE II.—CALIBRATION OF THE BALANCE.

Induction, B, at H = 20, determined from independent measurements.		Induction, B, read from balance.
13,300	... ...	13,280
13,400	... ...	13,400
14,340	... ...	14,360
14,350	... ...	14,290
14,600	... ...	14,470
14,900	... ...	14,960
15,100	... ...	15,060
15,080	... ...	15,150
15,570	... ...	15,650
15,800	... ...	15,720
16,000	... ...	16,000

These tests relate to different specimens, all tested with one constant current in the magnet of the balance. The agreement between the scale readings and the known values of B is satisfactory. Fig. 2 exhibits the same tests graphically, the readings of the balance being plotted against the known values of B for H = 20. They show that within this range of B the values of the induction (under constant H) are fairly represented by the readings on the uniformly divided scale of the balance. Such irregularities as occur lie equally, so far as can be judged, on both sides of the straight line. The readings of the balance may be accepted as giving values of B for H = 20 at least as accurately as these are required in the uses which the balance is meant to serve.

TRAMWAY BILLS IN PARLIAMENT.*

Aberdeen Corporation Tramways.—To authorise the Aberdeen Corporation to acquire, and the Aberdeen District Tramways Company to sell their undertaking; to empower the Corporation to work or lease the tramways; and for other purposes.

New Capital—by Loan, £150,000.

Blackburn Corporation Tramways.—*Inter alia*, to authorise the Blackburn Corporation to acquire, and the Blackburn Corporation Tramways Company to sell their undertaking; to empower the Corporation to make additional Tramways, to use electrical or any mechanical power, and to work their tramway undertaking.

New Capital—by Loan, £187,000.

New Lines—1 m. 5 chs, double; 3 m. 37 chs., single—Total track, 5 m. 47 chs.

* *Railway World.*

Blackpool and Fleetwood Tramroad (Tramway Extensions.)—To authorise the Blackpool and Fleetwood Tramways Company to construct tramways at Blackpool, to be worked by animal, electrical, or any mechanical power not being steam power; to empower the Company to supply electrical energy in bulk, and to raise additional capital; and for other purposes.

New Capital—by Shares, £75,000; by Loan, £25,000.

New Lines—The part of the Bill relating to extensions has been dropped.

Blackpool Improvement.—*Inter alia*, to authorise the Blackpool Corporation to make additional tramways, to be worked by electrical, animal, or any other mechanical power; and to empower the Corporation to work the tramways.

New Capital—by Loan, £12,500.

New Line—58 chs., double; 2 chs., single—Total track, 1 m. 38 chs.

Bristol Tramways (Electrical Power, &c.)—To authorise the use of electrical or mechanical power on the tramways of the Bristol Tramways and Carriage Company, Limited, and the compulsory purchase of land; and for other purposes.

Bristol Tramways (Extensions).—To authorise the Bristol Tramways and Carriage Company, Limited, to construct additional tramways, and to widen certain streets and roads; and for other purposes.

New Line—6 m. 55 chs., double; 32 chs., single—Total track, 13 m. 30 chs.

Burnley Corporation Tramways.—*Inter alia*, to authorise the Burnley Corporation to work their tramways, if and when they acquire the tramways authorised by the Burnley and District Tramways Order, 1879, to use electrical or any mechanical power thereon, to generate electricity, and to enter into agreements with regards to the tramways in the Borough of Nelson, the Districts of Padiham and Brierfield, and the Township of Reedley Hallows.

Bury Corporation.—*Inter alia*, to authorise the Bury Corporation to work their tramways, if and when they acquire the tramways in the Borough; and to construct electric works.

Cardiff Corporation.—*Inter alia*, to authorise the Cardiff Corporation to construct tramways; to use electrical and other mechanical power to work their tramways; and to enter into working agreement with certain tramway companies.

New Capital—by Loan, £261,510.

New Lines—6 m. 48 chs., double; 1 m. 69 chs., single—Total track, 14 m. 5 chs.

Clontarf and Hill of Howth Tramroad.—To incorporate the Clontarf and Hill of Howth Tramroad Company; to authorise the construction of tramroads, to be worked by electrical or any mechanical power, except steam power; to confer power to acquire land; and for other purposes.

New Capital—by Shares, £50,000; by Loan, £25,000.

New Line—1 m. 16 chs., double; 4 m. 38 chs., single—Total track, 6 m. 70 chs.

Corporation of London (Foreign Cattle Market) Deptford.—*Inter alia*, to empower the Corporation of the City of London to construct a tramway between the Foreign Cattle Market at Deptford, and the Deptford Wharf Branch of the London, Brighton, and South Coast Railway; to be worked by animal power, or, subject to the approval of the Board of Trade, by electrical or other mechanical power, not being steam power.

New Capital—included with other works. New Line—22 chs., single.

Devonport, Plymouth, and Stoke Tramways.—To incorporate the Devonport, Plymouth, and Stoke Tramways Company; to authorise the construction of tramways, to be worked by animal or mechanical power; and for other purposes.

New Capital—by Shares, £150,000; by Loan, £37,500.

New Line—5 m. 61 chs., double; 31 chs., single—Total track, 11 m. 73 chs.

Dublin Southern District Tramways.—To amend the provisions of the Dublin Southern Tramways Act, 1893, relating to the speed at which engines, carriages, and trucks may be driven or propelled on the Dublin Southern District Tramways Company.

Dundee Corporation Tramways.—To confirm an agreement between the Dundee Corporation and the Dundee and District Tramway Company, Limited, to empower the Corporation to work their tramways; to use electrical or any mechanical power; and for other purposes.

East Ham Improvement.—*Inter alia*, to empower the East Ham Urban District Council to purchase any tramway in their district, upon the terms and conditions set forth in Section 43 of the Tramways Act, 1870, as if the period of years therein stated elapsed on the day of the passing of this Act, and to authorise the Council to use mechanical power, and to work tramways.

New Capital—by Loan, £8,000.

Folkestone Electric Tramways.—To incorporate the Folkestone Electric Tramways Company; to authorise the Company to construct tramways in Folkestone, Sandgate, and Hythe, to be worked by animal, electrical, or any mechanical power, and to acquire land; to provide for the supply of electrical energy by or to the Company; to confer power to enter into working agreements; and for other purposes.

New Capital—by Shares, £200,000; by Loan, £50,000.

New Lines—3 m. 41 chs., double; 9 m. 8 chs., single—Total track, 16 m. 10 chs.

Great Orme Tramway and Tramroad.—To incorporate the Great Orme Tramways Company; to empower the Company to construct a tramway and a tramroad, to be worked by animal, electrical, or any mechanical power, and to acquire land; to confer power to enter into agreements as to supply of electrical or other power by or to the Company; and for other purposes.

New Capital—by Shares, £25,000; by Loan, £6,250.

New Line—Total track, 77 chs.

Halifax Corporation.—*Inter alia*, to authorise the Halifax Corporation to construct new tramways, and to apply certain provisions of the Act of 1897.

New Capital—by Loan, £77,270.

New Line—1 m. 66 chs., double; 10 m. 20 chs., single—Total track, 13 m. 62 chs.

Hastings and St. Leonard's Tramways Company.—To incorporate the Hastings and St. Leonard's Tramways Company; to authorise the Company to construct tramways, to be worked by animal or other mechanical power; and for other purposes.

New Line—2 m. 21 chs., double; 5 m. 1 ch., single—Total track, 9 m. 43 chs.

New Capital—by Shares, £125,000; by Loan, £31,250.

Ilford Improvement.—*Inter alia*, to empower the Ilford Urban District Council to work tramways for the time being belonging to them, and to use mechanical power thereon.

Ipswich Dock Commission.—*Inter alia*, to authorise the Ipswich Dock Commissioners to make tramways, to be worked by locomotive engines, and to enter into agreements with the Great Eastern Railway with respect to working.

New Capital—Included with other works.

New Line—36 chs., double; 37 chs., single—Total track, 1 m. 29 chs.

Keighley Corporation.—*Inter alia*, to empower the Keighley Corporation to maintain a certain existing Tramway; to work their tramways; to use electrical or any mechanical power thereon; and to construct works for generating electricity.

New Capital—Included with other works.

Leyton Urban District Council.—*Inter alia*, to empower the Leyton Urban District Council to work tramways for the time being owned by them within their district, and to use electrical or other mechanical power thereon.

London County Council (Northern Tramways).—To authorise the London County Council to construct tramways in the County of London; and for other purposes.

New Capital—by Loan, £32,000.

New Lines—2 m. 3 chs., double; 6 chs., single—Total track, 4 m. 12 chs.

London County Council (Westminster Bridge and Embankment Tramways).—To authorise the London County Council to construct tramways over Westminster Bridge and along Victoria Embankment, in the administrative County of London; and for other purposes.

New Capital—by Loan, £24,000.

New Line—1 m. 49 chs, double—Total track, 3 m. 19 chs.

London United Tramways.—To authorise the London United Tramways, Limited, to construct additional tramways; to acquire land; and to use electrical or any mechanical power; to confer power as to the supply of electrical energy by or to the Company; and for other purposes.

New Lines—15 m. 4 chs., double; 68 chs., single—Total track, 30 m. 76 chs.

Manchester Carriage and Tramways Company.—To authorise the Manchester Carriage and Tramways Company to use electrical or any mechanical power on their tramways; to enter into agreement as to the supply of electrical power by or to the Company; and to raise additional capital; and for other purposes.

New Capital—by Shares, £100,000; by Loan, £25,000.

Norwich Electric Tramways.—To authorise the Norwich Electric Tramways Company to construct additional tramways and to make street widenings; to apply certain provisions of the Act of 1897; to provide for the purchase of the tramways within and without the City Borough, by the Norwich Corporation, and for the raising of additional capital; and for other purposes.

New Capital—by Shares, £24,000; by Loan, £6,000.

New Lines—14 chs., double; 68 chs., single—Total track, 1 m. 18 chs.

Oldham Corporation.—*Inter alia*, to empower the Oldham Corporation to work their tramways; to use electrical or any mechanical power thereon, and to construct electric works.

Plymouth Corporation.—*Inter alia*, to authorise the Plymouth Corporation to construct an additional tramway; to use electrical or any mechanical power; to construct electric works; and to work their tramways; and to apply certain provisions of the Order of 1893.

New Capital—by Loan, £4,000.

New Lines—35 chs, double.

Portsmouth Corporation.—To empower the Portsmouth Corporation to purchase the tramways undertaking authorised by the Landport and Southsea Act, 1863, to construct new tramways, to use electrical or any mechanical power, to work their tramways, to acquire land, to generate electricity, and to borrow money; and for other purposes.

New Capital—by Loan, £88,800.

New Lines—1 m. 7 chs., double; 1 m. 1 ch., single—Total track, 3 m. 15 chs.

St. Helens Corporation.—*Inter alia*, to authorise the St. Helens Corporation to construct tramways in and near the borough, to use electrical or any mechanical power, to construct electric works, and to work their tramways; to enable the Corporation to purchase or take on lease tramways within or outside the borough; and to empower the Board of Trade in certain cases to make provisional orders for the construction of tramways outside the borough.

New Capital—by Loan, £50,000.

New Lines—72 chs., double; 8 m. 41 chs., single—Total track, 10 m. 25 chs.

West Ham Corporation.—*Inter alia*, to empower the West Ham Corporation to work tramways which they may acquire within the borough, to use electrical or any mechanical power thereon, and to construct electric works.

Wigan Corporation.—*Inter alia*, to authorise the Wigan Corporation to construct additional tramways, to use the electrical or any mechanical power thereon, to purchase tramways authorised by the Order of 1895, to construct electric works, and to work their tramways; and to empower the Abram, Ince-in-Makerfield, and Standish-with-Langtree District Councils to purchase the tramways within their respective districts.

New Capital—by Loan, £38,000.

New Lines—40 chs., double; 5 m. 41 chs., single—Total track, 6 m. 1 ch.

BLAST FURNACE GAS FOR MOTIVE POWER PURPOSES.

A PAPER on this subject, by M. A. Greiner, was read recently before the Iron and Steel Institute. As this subject has been discussed in previous issues of the REVIEW, it may be interesting if we give an abstract of the paper. The author first referred to the experiments made with an 8 H.P. gas engine at Seraing, and to those at Wishaw, described by Mr. Galbraith in December last. Proceeding, the author said:—A short description of the great 200 horse-power engine at Seraing may be of interest. Gas from the blast-furnace gas mains is led through three pairs of coke scrubbers, 1·5 metres in diameter and 6 metres high (5 feet × 19¾ feet). The coke is washed with water delivered by Koerting spray-producers. The gas passes successively through the two scrubbers of each of the three pairs, and then straight to the engine. It may be sent at will through a gas-holder which is used for testing, or as a reservoir in case of eventualities. The gas-holder is 12 metres (39½ feet) in diameter, and has a lift of 3 metres (10 feet). It holds 300 cubic metres (10,600 cubic feet). Gas is drawn through it by a fan driven by an electromotor. The gas engine is of the four-cycle type, with a single horizontal cylinder 800 millimetres (31½ inches) in diameter, and a stroke of 1 metre (39·37 inches). It runs 100 revolutions per minute. The connecting rod works on to a counterbalanced crank shaft. The fly-wheel is 4 metres (13 feet) in diameter, and weighs 15 tons. Compression in the cylinder is carried up to 8 kilogrammes per square centimetre (about 114 lbs. per square inch). Ignition is produced electrically, and is adjustable; the governor is outside, and the whole build of the engine is simple and strong.

It was proposed to utilise this engine for running a belt-driven dynamo for power and lighting purposes, but this will be done with the second engine, and the first will be used for driving an air compressor directly off the main shaft. The air compressed to five atmospheres will be led by pipes to different machines and pumps, which are now driven by steam at the same pressure. A simple cock will enable steam or compressed air to be used at pleasure.

A number of objections have been offered to the use of gas engines driven by blast-furnace gas. The chief of these is the trouble that may arise from the dust carried by the gas. At Seraing the gas from the furnaces is no cleaner than in other places, but rather the contrary.

As regards the impalpable dust carried forward by the gas into the gas engine, no details of its amount are available. According to Mr. Lurmann, of the Gutehoffnungshutte, there remains about two grammes of dust in the washed gas after all possible means of purification. At the Georg-Marienhutte, Osnabruck, an average of 2·91 grammes of dust was found in a cubic metre of washed gas. Round figures of 2 grammes and a 200 horse-power engine using 4 cubic metres of gas per horse-power-hour would give 40 kilogrammes, or 88 lbs. of dust daily. Happily, nearly all this will pass out with the exhaust, as is shown by the 8 horse-power engine, which ran for four months without necessitating a clean up of the cylinder. All the dust was thrown out in the form of a translucent white smoke. It would be difficult to find gas-fired boilers which had run four months without cleaning. Besides, it is no more requisite to use thoroughly clean gas in a gas engine than it is to use distilled water in a boiler.

The second objection attributes a destructive action to the dust, due to the acid matters, especially sulphuric acid, that it contains. Analysis, indeed, shows sulphuric and phosphoric acids, besides chlorine; but the alkalies and lime also present probably neutralise their effect. It is not necessary to use an inordinate quantity of water for washing purposes, and no corrosive action has been observed in two years. The only part that requires cleaning after a few months is the ignition appliance; but even that shows no sign of corrosion, and it can readily be replaced in a few hours. A comparison with the time taken for cleaning and repairing a boiler and its setting leaves no doubt on which side the advantage lies.

A third objection to the use of blast-furnace gas depends on the irregularity of its composition. This objection is not so serious as it appears. In the first place, the gas engine readily accommodates itself to the variable condition of the gas, and experience has shown that when the gas ignites with difficulty under the boilers, it is not too bad to affect the regular operation of the engines. Even if the furnace is not running well, and the gas becomes non-inflammable, the same inconveniences occur with both boilers and engines. Coal has to be burnt on the boiler-grates, and it would have to be used in gas producers for the engines.

In conclusion, a summary of the advantages accruing from the use of gas may be given. Gas is, above all other means, the most suitable for transmission of power. In a factory where motive power is required at scattered points, there are many advantages in a central producer plant from which gas is led to gas engines at the requisite places. Blast-furnaces are gas producers ready to hand, and when there are two or three together, there is not much danger of very great variations in the quality of the gas. Gas can be supplied with ease under a low pressure, and without appreciable loss by leakage or condensation, to considerable distances. The mains and pipes are simple, light, and economical. Boilers, and the dangers accessory to their use, may be abolished. Gas shares with electricity the advantage of directly giving light, heat, and power, and this alone is sufficient to ensure its use by manufacturers, and its general application in metallurgical works.

THE INSTITUTION OF JUNIOR ENGINEERS.

A numerously attended meeting of this Institution was held at the Westminster Palace Hotel on Friday, May 6th, when a paper on "Evaporative Condensers, and Independent Air Pumps for same," was read by Mr. Harry Fraser, of Millwall, Member. The chairman, Mr. H. Bloomfield Vorley, presided.

In introducing the subject, the author alluded to the increasing field which was opening up for the use of the evaporative form of condenser through the establishment of electric central stations for power and illumination purposes. These stations generally being placed in crowded districts, so as to be convenient for distributing the current, difficulties in obtaining an adequate water supply usually arose where surface condensers were employed. The evaporative condenser, if properly designed, would do its work with a water supply equal to three-fourths of the weight of steam which it condensed, and descriptions of such condensers producing vacuums up to 26 inches were given.

In designing the apparatus, it was necessary to bear in mind the boiling points of water at various pressures less than that of the atmosphere, as, should the water trickling over the outside of the tubes become too hot when nearing the bottom, the condensed water inside would be re-evaporated, and the vacuum destroyed. An arrangement of compound condenser, in which the coldest water was first brought in contact with the coldest part of the condenser and the hottest water against the hottest part, thereby obtaining the greatest possible exchange of temperature between the inside and outside surfaces, was described, and tabulated figures given showing its advantages.

It was of great importance to have all the joints well made, and easily accessible; a very small air leak would seriously affect the working of the apparatus, and the average deposit on the outside of the tubes left by the evaporating water amounting to 25 ounces per square foot per annum, provision for cleaning was most essential. Specimens of the author's devices for cleaning the outside of the tubes, and distributing the steam through the inside of the condenser were exhibited. No fixed condition as to design could be determined, as the spaces available for the erection of the condensers varied through such wide limits. It had been found that horizontal tubes were more advantageous than vertical, but that the space occupied by a condenser with horizontal tubes was larger than that necessary for the erection of a vertical tube condenser. The distance between the condenser and steam engine was of no consequence, provided that due area was allowed in the exhaust pipe and in the air pump suction pipes.

Most of the inventions in connection with evaporative condensers simply dealt with various arrangements for the distribution of the cooling water over the outer surface of the tubes, it being difficult to direct water to flow with an even film over a hot tube. Illustrated descriptions of some of these arrangements were given.

It being necessary that the evaporative condenser should have a much larger surface to do a given amount of work than an ordinary surface condenser, the cost of construction per square foot of surface was an important consideration. As indicating the effect of improvements in construction, it was stated that some of the latest designed apparatus cost about one-half per square foot of surface as compared with earlier ones, without the efficiency of the condenser being impaired. By experiment it had been found that artificial fan draught improved the efficiency of the apparatus by about 50 per cent., and a fan draught was recommended when the load varied to any considerable extent, as then the fan need only be run during the heaviest load.

With a properly designed condenser, the proportions of air pump used for a surface condensing apparatus would be found equally satisfactory with an evaporative plant. The idea that it was requisite to have a much larger air pump for the latter probably arose from some of the earlier condensers having been put up with not sufficient surface to fully deal with the volume of exhaust steam entering them. If the condenser were not large enough, putting in a bigger air-pump would not prove a remedy. Models and designs of the various air-pumps constructed by the Worthington Company, Blake & Knowles Company, Browett & Lindley Company, and others, were exhibited, all of them being of the balanced beam system, which arrangement largely helped to overcome the natural inequality of the turning moment of an independent air-pump.

With reference to the increasing popularity of air-pumps having one set of valves only, and that set being above the piston, the author pointed out that while such an arrangement might work satisfactorily with marine type surface condensers, it was not certain that they would be equally favourable with evaporative condensers; but as his firm were now building two sets on this principle for a 1,500 H.P. plant, he hoped later on to be able to give some more reliable information on this single-valve pump question.

A discussion followed the reading of the paper, in which Mr. A. H. Stanley, Mr. T. C. Morewood, Mr. A. E. Carry, Mr. J. H. Pearson, Mr. R. Marshall, Mr. S. Boulding, and Mr. W. J. Tennant took part. The author having replied, and a vote of thanks having been accorded him, the proceedings then concluded.

THE PARSONS TURBINE PATENT.

In our issue of April 22nd we gave briefly the decision of the Judicial Committee of the Privy Council to extend the Parsons turbine patent for a period of five years.

On Saturday Lord Macnaghten gave their Lordships' reasons. He stated, says the *Times*, the invention which was the subject of the patent was one of conspicuous merit. It had solved a problem which for 100 years and more had exercised and baffled the ingenuity of inventors. Many persons had endeavoured to employ the velocity of steam for the purpose of causing rotary motion without the intervention of any reciprocating apparatus. But no one before Mr. Parsons ever succeeded in producing a steam turbine of practical utility. Mr. Parsons had his attention directed to the subject while he was a student at Cambridge, and he devoted much time and thought to it then. But it was only after prolonged research and many experiments that he was able to determine the conditions of success. Mr. Parsons stated in his specification that motors according to his invention were applicable to a variety of purposes. Practically, however, up to the present time they had been applied only to the two purposes of electric lighting and marine propulsion. For the purpose of electric lighting the invention seemed to be specially adapted. In dispensing with reciprocating action Mr. Parsons got rid of vibration. It thus became possible to establish electrical stations in populous places and to use the most powerful engines there without fear of being stopped by an injunction on the ground of nuisance. As regards marine propulsion, only one vessel so far had been equipped with Mr. Parsons's invention. The success of that experiment had, however (as their Lordships were informed), induced the Admiralty to order two vessels of a similar type, one of which was guaranteed to attain the speed of 35 knots. Lord Kelvin, when examined as a witness, expressed his opinion that there was a great future for steam turbines, and that, for some purposes, Mr. Parsons's invention was likely to supersede the reciprocating type of engines. So far the case was clear. The difficulty began when the question of remuneration came to be considered. It would not be easy under any circumstances to appraise the value of such an invention or to assess even approximately the amount of remuneration which it deserved. The task was not rendered lighter by the circumstance that it was impossible to measure with anything like accuracy "the profits made by the patentee as such." If the invention had been less meritorious, their Lordships would have been disposed to consider that circumstance fatal to the application, as it certainly would have been if the difficulty had been attributable to any fault on the part of the patentee. But their Lordships were satisfied that the patentee's accounts had been fairly kept and fairly presented, and that Mr. Parsons had given their Lordships all the assistance in his power. The general accounts of receipts and expenditure in respect of the English patent, exclusive of its application to marine propulsion, brought a result showing that the total expenditure had exceeded the gross profits by £1,107 13s. 10d., after allowing interest on capital at 7 per cent. per annum, but without charging anything for the patentee's services. In regard to foreign patents corresponding to the English patent, the patentee's accounts brought out a loss of £202 4s. 11d. The Belgian, German, Italian, and Swedish patents were allowed to lapse in the interval between July, 1890, and December, 1893, when Mr. Parsons's patent rights were in the hands of his late partners, from whom they were repurchased in December, 1893, in consideration of £1,500. In September, 1895, Mr. Parsons sold to the

Westinghouse Machine Company, of Pittsburg, the United States and Canadian patents, together with other valuable patent rights belonging to him, but reserved the right to use all the patents comprised in the sale for the purpose of marine propulsion. The consideration was a lump sum of £5,000 and certain royalties in respect of which £850 had been received. The total amount received from the sale, after deducting expenses, was £5,263 18s. 8d., of which one-fifth was attributed in the accounts to the patent No. 6,735, 1884. Even if the whole proceeds of the sale were attributed to the original patent, it appeared to their Lordships that the gain on the foreign patents would not counterbalance the loss on the English patent if any reasonable allowance was to be made to the patentee for his services. The result so far, in a pecuniary point of view, was disappointing. Their Lordships were, however, satisfied that Mr. Parsons had done his best to push his invention. Its slow progress in public favour was in accordance with all experience. New methods were not welcomed by workmen or manufacturers, or even by mechanical engineers. The greater the novelty, the greater the apathy and hostility to be overcome. The circumstances relating to the application of the patent to the purposes of marine propulsion, and the results in the shape of profits attributable to that application, required a more detailed statement. In 1893, Mr. Parsons made numerous experiments in order to test the applicability of steam turbines for marine propulsion. In January, 1894, he granted to the Marine Steam Turbine Company, Limited, an exclusive license to use for marine propulsion only the patent in question, with a large number of others belonging to him. In consideration of that license he received £9,000 in fully paid-up shares in the company, which had an issued capital of £24,000 out of a nominal capital of £25,000, so that Mr. Parsons became interested in three-eighths of the issued capital of the company. In order to demonstrate the effect of steam turbines as applied to marine propulsion, the company built and equipped the *Turbinia*, at a cost of about £16,000. Mr. Parsons executed all the work for the company at net cost, and without making any charge for his own services. When the success of the *Turbinia* was established, a new company, called Parsons's Marine Steam Turbine Company, Limited, with a nominal capital of £500,000, divided into 5,000 shares of the nominal value of £100 each, was formed for the purpose of purchasing from the old company the license which they held from Mr. Parsons, together with the *Turbinia*, and all the tools and effects of the company. The purchase price was £30,000 in cash, and £80,000 in shares, together with certain royalties and certain rights to further shares in the event of further issues of capital. After repayment of the outlay on the *Turbinia*, the sum received in cash by Mr. Parsons in respect of his shares in the old company did not seem to have been more than sufficient to pay him a fair remuneration for his services in connection with the *Turbinia*. The result appeared to be that the remuneration which Mr. Parsons had received for his invention consisted of so much of his interest in the new company and so much of his remaining interest in the old company as might be properly attributable to the patent No. 6,735, 1884. As regarded Mr. Parsons's interest in the old company, he was entitled to certain royalties which no doubt might prove extremely valuable, but from which no profit had hitherto been derived. His shares in the new company, 300 in all, reduced in number by a few shares given by him to his employés, were admittedly of considerable value. Shares in the company were not on the market, and had never been sold. Their Lordships, however, thought they ought to be taken at their par value. The question then arose how much of Mr. Parsons's interest in the old company and in the new company was properly attributable to the patent No. 6,735, 1884. That was a very difficult question. But, having regard to all the circumstances, and having considered the evidence of the gentleman who assessed the value of the patents comprised in the sale to the new company for the purpose of apportioning the price between them, their Lordships had come to the conclusion that the amount should be taken at not more than one-half and not less than one-fourth. Having arrived at that conclusion, considering the position of the new company, bearing in mind that it could not commence operations at the earliest before August next, and that the value of the shares in the new company must depend to a large extent on the prolongation of the original patent, and weighing all the other circumstances of the case, their Lordships were of opinion that Mr. Parsons had not been adequately remunerated, and they would consequently make their report to that effect. They had already intimated that the patent should be prolonged for five years.

NEW PATENTS.—1898.

Compiled expressly for this journal by W. P. Thompson & Co., *Electrical Patent Agents*, 322, *High Holborn, London, W.C., to whom all inquiries should be addressed.*

10,022. "Improvements in the manufacture of carbons and filaments for electric lamps." G. Daubenspeck. Dated May 2nd.

10,034. "A new or improved primary electrical battery." A. Frazer and G. A. Smith. Dated May 2nd.

10,065. "An electric double-pole fuse plug and combination grid connection." A. Walters. Dated May 3rd. (*Complete.*)

10,291. "Rheostats for electric circuits." C. Wirt. Dated May 5th.

10,308. "Improvements in appliances for automatically replacing fuses in electric installations for lighting or transmission of power." S Harrison. Dated May 5th.

10,314. "Improvements in, or relating to, electric motors." H. H. Lake. (R Arno and A. Caramagna, Italy.) Dated May 5th.

10,333. "Improvements relating to electric signalling and similar apparatus." L. S. Crandall. Dated May 5th. (*Complete.*)

10,346. "Improved apparatus for automatically cutting off current of electric overhead or other like wires." R. Bostock and F. A. Cheetham. Dated May 6th.

10,352. "An improved magnetic motor engine." E. J. Knight. Dated May 6th.

10,428. "Improvements in electro-therapeutic exercising apparatus." A. Martin. Dated May 6th.

10,437. "Improvements relating to cut-outs and switches for electric motors and other electrical apparatus." G. A. Moore. (H. H. Cutler, United States.) Dated May 6th. (*Complete.*)

10,440. "An improved detachable ceiling rose for use with arc lamps and other electrical apparatus." A. L. Davis. Dated May 7th.

10,450. "Improvements in the construction of dynamo-electric machines and motors." M. W. W. Mackie. Dated May 7th.

10,457. "Improvements in galvanic batteries." E. Habermann. Dated May 7th.

10,475. "Improvement in electrical accumulators." W. Peck. Dated May 7th.

10,477. "Improvements in quick-break switches or cut-outs for electric lines." G. Jaeger, C. Jaeger, and H. Bender. Dated May 7th. (*Complete.*)

10,453. "Improvements in and relating to electrical switches." F. W. Abbott and R. W. Bill. Dated May 7th.

10,496. "A new or improved maximum electric current self-recording instrument." F. M. Staunton. Dated May 7th.

10,511. "Improvements in and apparatus for producing mechanical energy from alternating electric currents." A. Heyland. Dated May 7th.

10,523. "Improvements in apparatus for regulating electric arc lamps." I. H. Hegnar. Dated May 7th. (*Complete.*)

ABSTRACTS OF PUBLISHED SPECIFICATIONS.

Copies of any of these Specifications may be obtained of Messrs. W. P. Thompson & Co., 322, High Holborn, W.C., *price, post free,* 9d. *(in stamps).*

1897.

19,035. "Improvements in electrolytic apparatus." H. S. Johns. (E. Balbach.) Dated August 17th, 1897. This consists of a cathode case composed of a trough having its bottom divided in two portions, one of which is horizontal. The other portion sloping down and connecting the horizontal portion throughout its length. It is provided with a cathode plate and an anode suspended therein, arranged to cover the horizontal portion of the bottom only. The anode case is composed of an exterior frame which has a grated bottom, and an inner frame fitting into the exterior case, with a filter cloth bottom. Instead of one anode case there may be a series, arranged transversely side by side. 5 claims.

20,041. "Improvements in metal for telegraph and other poles." G. W. Glazier. Dated August 31st, 1897. This consists of a pole, to the end of which is secured segmental metal base sections, by means of bolts. The lower ends of these sections are made outwardly flaring, and are provided with a series of perforations through which the earth is rammed after these sections have been placed in a cavity in the ground. On the outside of these sections are strengthening ribs which, besides serving to increase the strength, also in a measure conceal and protect the heads and nuts of the fastening bolts. 2 claims.

1898.

3,796. "Improved means for displacing, dispersing, or extinguishing arcs formed in breaking electric circuits." S. H. Short. Dated February 15th, 1898. Relatively stationary co-operating contacts are mounted on the controller of a cylinder and conducting coils comprising spiral convolutions, are arranged in the circuit to be broken adjacent to each pair of contacts. There is a shunt circuit for these coils and contacts controlling the shunt circuit, so that when the controller is in "running" position the coils are cut out of the working circuit and are replaced in circuit in advance of the opening of the circuit. 10 claims.

THE

ELECTRICAL REVIEW.

VOL. XLII. MAY 27, 1898 No. 1,070.

CONTENTS:

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON.

Telegraphic Address: "AGEKKAY, LONDON." Code A B C.

Telephone No. 988 Holborn.

ALL Letters should be addressed to the Proprietors, H. Alabaster, Gatehouse & Co.

ADVERTISEMENT RATES ON APPLICATION.

The "Electrical Review" is the recognised medium of the Electrical Trades.

SUBSCRIPTION RATES.—In *Great Britain*, Post Free per Year, 19s. 6d. To *all other countries*, per Year, £1 4s.

BINDING.—Subscribers' numbers bound, including case, for 4s. each volume.

CASES.—Cloth Cases for Binding can be had, price 2s. 6d. each.

READING CASES, to hold from One to Twenty-six Numbers until the Volume is complete for Binding, can now be had from the Publishers, Price 6s. or Free by Post (in Great Britain), 6s. 6d.

FOREIGN AGENTS.—*New York:* D. VAN NOSTRAND, 23, Murray Street. *Paris:* VEUVE J. BOYVEAU, 22, Rue de la Banque. *Berlin:* ASHER & Co., 5, Unter den Linden.

Cheques and Postal Orders (on Chief Office, London) to be made payable to Mr. H. ALABASTER, 4 Ludgate Hill E.C.

THE STANDARDISING OF GENERATORS, MOTORS, AND TRANSFORMERS.

THE title of this article names the subject set for discussion at a recent meeting of the American Institute of Electrical Engineers at New York, and in opening this meeting the president said that, although the general desirability of standardising electrical apparatus had often been spoken of, and seemed to be generally believed in, yet people were by no means agreed as to the feasibility or policy of the Institute taking steps in that direction; and he, therefore, suggested to the meeting, as proper subjects for discussion, the general question of the advisability of fixing standards, what standards should be fixed, and how far they should go. Mr. E. W. Rice, jun., then opened the discussion, and after referring to the great advantages which accrued from establishing certain standard types and sizes of apparatus, said that, in his opinion, standardising in this direction was a matter which the Institute should not deal with. There were, however, certain features of the subject under discussion which, it seemed to him, could and should properly be considered by the Institute; and he then suggested seven subjects, as follows:—

1. *Definition of Efficiency.*—Mr. Rice stated that electrical efficiency was still sometimes confused with commercial efficiency, and that a more exact definition of the term "commercial efficiency" was wanted, as in the United States the mechanical losses, friction, and windage of the dynamo were debited to the prime mover in the case of direct-coupled machinery, and to the dynamo in the case of belt-driven machinery.

2. *Heating Limits, and Methods of Determining the Same.*—Mr. Rice did not advocate the adoption of any definite number of degrees rise of temperature as a standard, but pointed out the necessity of better defining the methods to be employed for measuring this rise of temperature.

3. *Regulation.*—As an illustration of the necessity of a more accurate definition of what was meant when it was stated that a machine should regulate within a certain percentage, it was mentioned that many different definitions of the term regulation, as applied to alternating current machinery, were in actual use by different engineers; amongst them being the percentage drop in terminal pressure from no load to full load, with constant open circuit excitation; the percentage rise of terminal pressure from full load to no load with constant full load excitation; and the percentage increase or decrease of excitation required to maintain a constant terminal pressure from no load to full load, or *vice versâ*.

4. *Sparking.*—Mr. Rice thought they must all admit that this was a difficult matter to standardise; but he suggested

that the meeting might consider whether they could not define the limits between which freedom from sparking should be demanded for commutating machinery.

5. *Insulation and Methods of Testing.*—As it was frequently specified that the insulation of a generator or motor should withstand certain breakdown tests by being subjected to a pressure considerably higher than its working pressure; Mr. Rice suggested that, although it was perhaps too early, in view of the rapid development of the industry, to determine definitely the limits and conditions of such tests; yet the subject might be discussed with profit, and perhaps some useful recommendations be made.

6. *Rating.*—As an illustration, Mr. Rice mentioned that it was customary in the United States to rate alternating current machinery on the basis of volt-amperes output, whereas in other countries the rating was often based upon the volt-amperes output multiplied by an assumed cosine of the angle of lag, and he suggested that some standard method should be adopted.

7. *Frequency of Alternating Current Machinery.*—Mr. Rice said that alternators were being built in the United States for frequencies of 25, 30, 35, 40, 50, 60, 66, 125 and 133, and he suggested that three or four frequencies might be selected which would practically meet all requirements under the different conditions of generation, transmission and service, and that great advantages would accrue if it were possible to agree on such a limited number of standard frequencies.

In concluding his remarks, Mr. Rice laid much stress on the advisability of referring the question to a small committee of members, which would be instructed to confer with manufacturers, consulting engineers, and prominent users of electrical apparatus, and to report its recommendations to the Institute. The discussion which followed, and adjourned without any definite resolution being adopted, showed considerable divergence of opinion both as to what should be standardised, and as to the best way of dealing with the questions suggested for consideration; indeed, a great part of the time was spent in discussing the momentous question of whether manufacturers should or should not be admitted as members of the committee to which it was proposed to refer this question of standardising. The reason for objecting to manufacturers as members of the committee was apparently the fear that they would each have an axe of their own to grind, and that they would devote too much of their energies to this same grinding operation. It appears to us that consulting engineers, professors, and other non-manufacturing engineers will also have their special axes, and it does not seem fair to assume that one class is more likely than the other to try and use the committee for its own purposes, especially when it is borne in mind that the committee should be composed of the best men of each class. As the questions to be examined by the committee were the stricter definition of terms used in specifications and contracts, and the standardising of methods of testing, of rating of machines, and of frequencies of alternating current plant, all of them questions of great importance to the manufacturer; we certainly agree with Dr. Kennelly when he said in the course of the discussion that, "having a committee to recommend how manufacturers should make apparatus, without having any manufacturers on that committee, was something like playing Hamlet with Hamlet left out."

Although there were several speakers who thought that something might be done in the way of standardising types of apparatus, the general consensus of opinion was decidedly that any attempt by the committee at standardising apparatus would be a wrong policy. With this we entirely agree, as we consider that, with very few exceptions, the buyer's engineer should confine himself to defining what the apparatus has to do and how its capabilities of fulfilling the specified conditions will be verified, and that the construction of the machine should be left to the manufacturer. If this were done more in England, manufacturers would in their own interests standardise to a greater extent than they do now, and the buyer would undoubtedly benefit thereby, as machines would be made at less cost and more quickly than at present. Of course there always will be certain cases where the conditions of working will demand that a machine be designed specially to fulfil these requirements; but one finds too frequently that specifications for machines for ordinary lighting work are issued which demand that various details of the apparatus shall be constructed in a way which does not allow of the use of standard patterns. That this is so is to a great extent the fault of the manufacturers themselves, because they are so keen on getting the order that they do not make a sufficient difference in price between their standard apparatus and the one which embodies the alterations asked for; and we think that in this respect we might take a lesson from American manufacturers, who stick much more closely to their stock sizes, make these in large numbers, and, therefore, at reduced cost, and charge very considerable extras for any departure from their standard design.

With regard to the subjects enumerated by Mr. Rice, we think there is need also in this country for a better definition of terms and of methods of verifying whether electrical machinery fulfils the conditions laid down in the specifications. In the matter of efficiency, for example, although most specifications fix a commercial efficiency which has to be guaranteed, or require that the contractor shall fix it in his tender, very few state how it is to be measured; and anyone who has had practical experience of efficiency testing of belt-driven machines, knows that very varying results may be obtained by employing different methods of testing, such as the Swinburne method of measuring the stray power, and adding thereto the calculated $C^2 R$ losses; or the Hopkinson method of coupling two similar machines mechanically and electrically, and measuring the extra energy supplied to enable one machine to act as a motor and drive the other as a dynamo; or, again, the older way of trying to arrive at the efficiency of the dynamo by indicating the engine. Again, with regard to rise of temperature of the armature and magnet coils, we have the thermometer method, and the method of determining the rise of temperature by the increase of the conductor resistance, and these two methods give very different results. Each method has its advantages, and it does not matter much which is used, so long as the temperature limit is fixed in accordance with the method to be employed, and this method is clearly defined as is done, for example, in the Admiralty specification for dynamos. We know, however, of cases where the method of testing has not been specified, and the manufacturer has considered that his machine has fulfilled the conditions, whilst the receiving engineer has held that it was not to specification, because one wanted to test with a thermometer and the other by conductor resistance.

The rating of the output of a direct-current dynamo, and the limits within which it should regulate, are also points deserving of attention, as we believe there are great variations in these respects between machines listed at the same output by different makers; and the buyer who wants a 200-light dynamo and gets quotations for its supply, often has nothing to tell him, whether the machine he buys will do its full load with a rise of temperature of, say, 60° F., and an increase of speed of 5 per cent. after a six hours' run, or with a rise of 80° or 90° F., and an increase of speed of perhaps 10 to 15 per cent.

Another point where greater uniformity would be an advantage is in the specification of insulation. In some cases it is specified that the insulation shall stand a breakdown test with a pressure which may be several times the working pressure, and in others a minimum resistance is fixed. In neither case does there appear to be any uniformity in the requirements—that is to say, that different engineers specify different ratios of testing pressure to working pressure; and whereas one specification will require an insulation resistance of half a megohm or less, another will ask for 5 megohms for machines working at the same voltage. If half a megohm is sufficient (and it may well happen that a machine having an insulation resistance less than that will stand a high pressure test better, and will be a more durable machine than one giving an insulation resistance of 5 megohms), it surely is unnecessarily increasing the price of the machine to insist that a manufacturer shall change his standard methods of insulation, so as to be able to get five megohms after carefully drying and cleaning all surfaces over which leakage may take place, and so putting the machine into a condition altogether different from that in which it ordinarily works.

The last point mentioned by Mr. Rice is the frequency of alternating current plant, and although we do not think that the frequencies used in this country vary so widely as appears to be the case in the United States, yet, as the differences which do exist are often found to be very inconvenient by makers of apparatus to be used on alternating current circuits, we think, as we have often said, that the fixing of certain standard frequencies would be advantageous, as it would enable such apparatus to be supplied more quickly and at lower costs.

There are, no doubt, other questions which will occur to our readers, such, for instance, as whether there is any serious advantage gained by the use of lamp voltages, which differ very little from one another, as, for example, 100, 110, and 115 volts, or the corresponding 200, 220 and 230 volts; but we do not propose to go further into the matter, as our object is not to discuss these various questions in detail, but rather to draw attention to what is taking place in America, and to invite our readers to consider whether it would not be to the advantage of the electrical industry if some similar steps were taken in England in the direction of fixing certain standard definitions and methods of testing; and even in some special cases of standardising apparatus, not by interfering in any way with the details of construction, but by agreeing to a more uniform specification with regard to voltage, frequency, and other kindred matters.

Telegraphy by Electric Oscillations.

ELENKONSKY, in an article on "Telegraphy by Means of Electric Oscillations," which appears in the last issue of our Russian contemporary, *Elektrotechnik*, describes the progress realised since Hertz by Righi, Sarasin, De la Rive, Boltzmann, and Zender. He points out the influence of metallic powders on the electric waves, and tells us how, in 1890, Branly discovered his radio-conductor, and Lodge, after him, constructed his coherer, which is a kind of microphone. Branly demonstrated in 1890 that his radio-conductor can be used for revealing the electric waves, produced at a distance. Narkievitch Iodko had succeeded before Popoff in transmitting signals by means of a modified Lodge apparatus, at a distance of more than 2 kilometres. According to his articles in different papers, and to his letter to Ducretet, Popoff stated in the *Proceedings of the Russian Society of Physics and Chemistry* (December, 1895) that his apparatus can be utilised for transmitting signals by means of rapid electric oscillations when a sufficiently strong discharger of these oscillations is available. When Marconi made public his discovery, Popoff, in the journal *Kotlin*, declared that he had already succeeded in transmitting signals on land at a distance of one nautical mile and on sea at three miles. Therefore, the conclusion is:—1st, that Marconi utilised for his apparatus the principles discovered by other experimenters; 2nd, that before Marconi, many experimenters had demonstrated the possible adaptation of the electric vibrations to the transmission of signals. No one will assert that Branly, Lodge, and Popoff would not have been able to find the practical solution of the problem if they had taken the subject in hand, and if they had *believed* in the practical future of telegraphy by means of electric vibrations. Marconi's merit is that he *believed* in the future of wireless telegraphy, and that in view of this practical object, he developed and simplified apparatus which, until then, had only been employed for theoretical work.

Economy Test of a Central Station.—Before the American Institute of Electrical Engineers, Prof. Goldsborough, of Purdue University, read a paper on the economy test of the West Pratt Street station of the Edison Electric Illuminating Company, of Baltimore, Ind. The paper is abstracted in the *Electrical World*. "While the station is not by any means a model up-to-date one, it is perhaps representative of the average lighting station of gradual growth and moderate size. The engine equipment, for example, consists of one 600-H.P. horizontal cross-compound Ball & Wood engine, one high speed Russell simple engine of 170 horse-power, one of 125 horse-power, one 300-H.P. tandem-compound Ideal engine, one 300-H.P. cross-compound Ball & Wood engine, two 145-H.P. Buckeye engines, and one 300-H.P. Ide engine. The generators are series arc and 1,000-volt alternating machines of as wide a range of makes and sizes, all being belted machines. The tests were most complete, and some of their results are of interest, in that they show the low economy to be expected of such a heterogeneous equipment. The boiler tests showed that the equivalent water evaporated per pound of combustible from and at 212° Fahr., varied from 6·83 lbs. to 12 lbs., averaging between 8 and 9 lbs. The all-day efficiency of the plant or ratio of the electrical horse-power at the switchboard to the indicated horse-power at the engines was found to be about 68 per cent., which is commented upon as 'excellent, in showing that the station is operated far more efficiently than could be expected, when the numerous drawbacks which have to be contended with are remembered.' The electrical output per pound of coal is given for one test as 150·5 watt-hours, and for another test as 157·3. This figure is compared with the data given in the report of the committee of the National Electric Light Association in 1896, in which the average efficiency of 81 stations, using coal as fuel, was given as 108 watt-hours per pound of coal."

THE INSTITUTION OF ELECTRICAL ENGINEERS.

At the meeting of the Institution of Electrical Engineers held on the 12th inst. at the Society of Arts, Prof. Ewing gave a summary of his paper on "A Magnetic Balance for Workshop Tests of Permeability," and exhibited the apparatus in use. After the discussion on this paper closed, Mr. A. H. Gibbings, borough electrical engineer of Bradford, described the supply meter, based on the decomposition of an aqueous acidified electrolyte, which formed the subject of his paper on "The Registration of Small Currents Used for Electric Lighting or other Purposes."

Prof. Ayrton opened the discussion on Prof. Ewing's paper, and congratulated the writer on the many ingenious instruments he had devised for electrical measurements. The speaker was surprised to find that the magnetic balance had so open a scale for so small a range with the same magnetising force. In the paper it was stated that "the range of the balance extends (for H = 20) from 12,000 up to something over 16,000. He would have thought the instrument would have been less sensitive, and therefore less valuable, and would like to know the actual force of detachment employed for a given position, also how the actual force (H) is divided up. Lastly, it would be interesting to be informed how far there is risk of error being introduced from the presence of dirt, &c., at the point of contact between the specimen and the magnet pole; as there are curved surfaces the reluctance may be small. The interesting question is the kind of error—how far a slight trace of oil or dirt would interfere with the accuracy of the instrument, which seemed to be, from the experiments shown, very great.

Prof. Perry remarked that he understood Prof. Ewing was satisfied, and that we were told an accuracy of 1 per cent. could be obtained. The speaker should hardly have expected such accuracy. Throughout the discussion the feeling was prevalent that what Prof. Ewing considered could be obtained from the balance would be got; the invention of such an able and illustrious worker in magnetics being certain to prove accurate and highly useful. This was the tone in which Prof. S. P. Thompson spoke when joining in the congratulations to the author: "If Prof. Ewing is satisfied, no one else ought to be dissatisfied." Long ago Prof. Thompson had devised the permeameter, and he felt gratified that Prof. Ewing was now converted to traction methods, the instrument before the meeting being a much better and more refined apparatus than others working on similar principles. He would return another compliment paid him when placing his instrument before the public—namely, criticise the balance. The criticism originally was that he ought to have cut the bar in the permeameter in the middle; he had placed the contact right outside. To make the contact on the top of a projecting pole-piece, however, certainly surpassed Prof. Thompson! Again, in the permeameter a faced joint was required, but the reluctance of the lead joint was so small it made no perceptible difference, and Prof. Ewing had again gone one better. Whether by such a very small contact—that between the side of a turned bar ½ inch in diameter and a pole having a slightly convex surface, the side of the rod touching the pole at one point only—there would not be some error due to gathering of the magnetic flux was a question.

Prof. Ewing has taken the value of the force H as 20. Prof. Thompson supposed it was good to have a fixed value; the instrument does not pretend to give points along the magnetic curve, but one frequently wants values in other fields than one, and in large multipolar machines B is often lower than 13,000 and the fields are lower than 20, while in the teeth of core discs B runs up to 20,000, far beyond the limits of this instrument at the upper end. The last and only other point Prof. Thompson made was that he wished he could induce Prof. Ewing to use Clarendon type. This brought Prof. Perry to his feet with an emphatic protest against the use of Clarendon type, and the expression of a pious hope that Prof. Ewing would do nothing of the sort.

Mr. Mordey was glad to see how Prof. Ewing was adding practical instructions to valuable theoretical work, and desired to direct attention to iron testing in bulk. He thought the instrument shown that evening was one of the simplest and best, but what one wants is to take a big casting and make a test of its magnetic quality before it goes in the tools; cutting a piece out of it may affect the character of the sample; he asked Prof. Ewing to increase our indebtedness to him by enabling us to test iron in bulk. Cast-iron varies enormously in its magnetic qualities. Identical machines may vary 70 per cent. in exciting current, and such differences are very serious indeed when a strict specification has to be complied with. He wanted to know whether it was necessary to be particular as to the time the current was on, or the time taken to detect the best piece in the balance.

He would say we should get out an instrument that would enable one to order iron and steel of certain definite magnetic qualities and pay for what is got, and not for what makers like to give one. When he started making transformers Swedish iron was very good, but afterwards iron all over the world got very much worse with some very uncomfortable results; orders were accepted which stipulated for a certain loss, but iron got poorer in quality, the losses went up, and makers were penalised heavily through no fault of their own. He had advised that material should be ordered of a certain magnetic quality, but makers did not like the specification at first; in six months, however, the result was that the quality crept up, and came within 5 per cent. of the specification, owing to a penalty and bonus clause giving in shillings per cwt. an allowance for the losses (in watts per pound) due to magnetic qualities. He thought if one could specify iron for magnets in any way like that a very great service would be rendered.

Mr. Swinburne pointed out that the mistake with some forms of traction instruments for magnetic testing was that the pull would be too high if any unevenness existed at the contact. Obviously, the contact is more highly saturated than anywhere else, and there is thus the chance of a pretty big error. Prof. Ayrton interpolated the remark that this was the whole interest of the apparatus before the meeting, within its range this crowding together compensated for the variation in the distribution of the magnetising force in the circuit. That is not what one would have expected *à priori*. Mr. Evershed thought that the natural criticism of the balance had been very well put by Mr. Mordey.

In his reply Prof. Ewing said that Prof. Ayrton had commented upon the comparatively large range of scale, the large preponderance of force was due to the beam of the balance itself, and the weight served to make small differences. The magneto-motive force is no doubt mainly used to overcome the reluctance of the specimen at the point of contact, and there is great crowding, therefore the instrument might not serve very well to make tests with low values of magneto-motive force. As things are, one has a force which is high in the specimen itself. What one has is a force of 20 on most of the specimen and a force very much higher than 20 at the contact; but if the bar has good permeability for one of these points it will be relatively good at others. Prof. Ewing deprecated the determination of B in absolute methods except by ballistic determination. All he did was to use a traction method to compare two bars, one of which had been carefully tested ballistically. It was true that points on the B H curve were not obtained; if such were wanted, his permeability bridge was distinctly the instrument to be employed. There was no difficulty in wiping the contact clean. He closed with some remarks on the increase in magnetic losses of sheet iron due to continued use in a variable magnetic field.

Mr. Gibbings then gave a description of the electrolytic meter devised by Mr. Bastian, which was the subject of an article in the Electrical Review of the 13th inst. Mr. Evershed was at a loss to know how far he could praise this meter, being interested in a meter of his own. He had expressed a desire to see a meter that could be made for 40s. or 50s. (see remarks by Mr. Evershed, *Municipal Electrical Association Proceedings*, 1897, p. 64, and reprint in Mr. Gibbings's paper). The principal question was how long this meter was going to last. One and all electrolytic meters had failed from causes difficult to trace, generally, however, the end was a general disintegration of the electrodes. Another criticism was as regards evaporation of the water. Although oil had been used on the surface of acid in accumulators, he had found that this did not get rid of spray. The large drop in volts was not so serious as one would expect, being only ½ per cent. from no load to full load. The nearly all the energy is spent in heating conductors. He had found that in well known types only $\frac{1}{300}$th of the total power went to drive the gear, the rest was wasted in heating, so that in the motor-meter one has an absurdly inefficient means of integration. Then materials necessarily cost a lot, a thermometer could be sold for 1s. 6d., but as one must have a considerable amount of copper to get losses down to a reasonable amount a meter must be costly. Gas meters were relatively efficient and fairly accurate, whereas the Hookham meter absorbs 5 and the Thomson 12 watts. Some interesting but rather irrelevant figures as to gas meters were then given, which it is unnecessary to reproduce.

Mr. Swinburne had been accused of having tried to make every kind of meter, but none would work; he *had* got a meter that worked, however, although someone else had patented it before him. One's first inclination in discussing a matter of this kind is to say, "Oh! that was done years ago." He replied: "Don't believe it." Every crude idea is not an invention; any fool can make an invention; it takes a clever man to work out the details, and a genius to sell it!

Mr. Arthur Wright thanked Mr. Gibbings for bringing before them a meter which will help to sell their product. The efficiency of a meter never seems to occur to his friends in central stations; the question is, will it register? and does it cost very much to keep in order? He had heard that the question of the volt-drop was immaterial; it seemed to him that the objection was that 1 per cent. of the station output was wasted in making gas.

Mr. Hirst had had a good deal of experience with central station engineers, and found they looked at the cost of maintenance closely. He thought the use of oil on the top of the water would mean cleaning frequently, and that the refilling meant the loss of previous readings. Every meter maker felt the want of a small meter for small consumers. The Board of Trade had insisted upon unnecessary accuracy in electricity, as compared with gas meters. Then as to the lost or wasted power; this had been mentioned as 10 to 12 or 15 watts. He knew of a meter—whose name need not be given—which only required 1 watt. The audience fully realised the force of Mr. Hirst's argument, and whence it was directed. Mr. J. W. Swan thought the meter well deserved a trial.

Mr. Gibbings, in his reply, stated that six months' experience of the meter had been obtained. He attributed the avoidance of error to the small surface exposed to evaporation, and considered the great merit of the apparatus to be the certainty of registration with small C.P. lamps on "high voltage" circuits.

UNIVERSAL SHUNT.

By J. RYMER-JONES.

IN the ELECTRICAL REVIEW of April 10th, 1896, p. 467, is a description and illustration of a convenient adjustable "universal" shunt, with a X power of any value from 1 to 10,000; and which when not required for a shunt can be employed for all tests, based on the "Fall of potential" principle, for which the Kelvin-Varley slides are applicable.

Although this form of shunt leaves nothing to be desired in point of convenience, and has been employed during the last two years for testing cable in the factory with very satisfactory results, yet owing to the cost being an important consideration, the writer has lately turned his attention again to the subject, with a view to including the slide proper and the so-called *vernier* slide in one box, and at the same time considerably reducing the price of construction. The present object, however, in again referring to the above subject, is not so much to draw attention to simplification effected, as to point out and correct an error when speaking of the K-V slides as not being applicable for a *universal* shunt.

Although shunting two of the *main* coils r_2 of the K-V slides with 100 *vernier* coils $x + y$—the sum of which latter gives an equal resistance—produces a *fall of potential* in these two parallel circuits equal to that in one of the main coils, so that a sliding contact on the *vernier* branch (divided into 100 parts) gives the potential at each of the subdivisions (figs. 1 and 2), yet it appeared at first sight equally evident that, while suitable for *potentials*, the conditions would be entirely changed if employed as a universal shunt; *i.e.*, for a continuous current flowing through the system; and that not only would the resistance *permanently* shunting

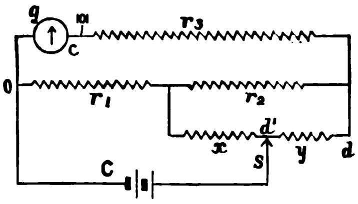

FIG. 1.

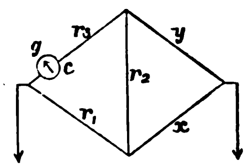

FIG. 2.

the galvanometer vary somewhat—when, for instance, the the vernier contact s is at d to when it is at d' or some other intermediate point—but that the X power of the shunt would not be strictly proportional to the scale reading.

To ascertain what the difference actually was, the writer calculated the current c passing through the galvanometer for various positions of the vernier contact when shunting different parts of the main resistance by the following formula obtained from the laws of dynamic electric circuits:—

$$c = \frac{r_1 (x+y+r_2) + x\,r_2}{(x+y+r_2)(r_3+g) + r_1 (x+y+r_2) + r_2 (x+y)}\ \mathrm{C}, \text{ or}$$

$$\frac{r_1 (y+r_2) + x (r_1+r_2)}{(r_1+r_3+g)(x+y) + r_2 (r_1+r_3+g+x+y)}\ \mathrm{C},$$

where $r_1 + r_2 + r_3 = 1,100^{\omega}$ = total resistance of the *slides* proper; r_2 = two coils of 100^{ω} each = 200^{ω}; $x + y = 100$ vernier coils of 2^{ω} each; $g = 1,200^{\omega}$; C = current from battery; c = current through galvanometer.

It was no little surprise to find that the calculated X powers are in every case identical to the values obtained with the ordinary simple univeral shunt as shown by the following examples:—

(1) Slide reading = 10,000, *i.e.*, $r_1 = 9,900$, $r_3 = 0$, $x = 200$, and $y = 0$.

X power ratio.

$$\begin{array}{lll}
y + r_2 = 200 & 200\,r_1 = 1,980,000 & \\
r_1 + r_2 = 10,100 & 10,100\,x = 2,020,000 & \\
 & \quad 4,000,000 & \\
x + y = 200 & 11,100\,(x+y) = 2,220,000 & \\
r_1 + r_3 + g = 11,100 & & \\
r_1 + r_3 + g + x + y = 11,300 & 11,300\,r_2 = 2,260,000 & \\
 & \quad 4,480,000 &
\end{array}$$

$$c = \frac{4,000,000}{4,480,000} = \frac{1}{1{\cdot}12}\ \mathrm{C} \qquad 1.$$

(2) Slide reading = 100, *i.e.*, $r_1 = 0$, $r_3 = 9,900$, $x = 200$, and $y = 0$.

$$\begin{array}{ll}
y + r_2 = 200 & 200\,r_1 = 0 \\
r_1 + r_2 = 200 & 200\,x = 40,000 \\
x + y = 200 & \\
r_1 + r_3 + g = 11,100 & 11,100\,(x+y) = 2,220,000 \\
r_1 + r_3 + g + x + y = 11,300 & 11,300\,r_2 = 2,260,000 \\
 & \quad 4,480,000
\end{array}$$

$$c = \frac{40,000}{4,480,000} = \frac{1}{112}\ \mathrm{C} \qquad 100.$$

(3) Slide reading = 1, *i.e.*, $r_1 = 0$, $r_3 = 9,900$, $x = 2$, and $y = 198$.

$$\begin{array}{ll}
y + r_2 = 398 & 398\,r_1 = 0 \\
r_1 + r_2 = 200 & 200\,x = 400 \\
x + y = 200 & \\
r_1 + r_3 + g = 11,100 & 11,100\,(x+y) = 2,220,000 \\
r_1 + r_3 + g + x + y = 11,300 & 11,300\,r_2 = 2,260,000 \\
 & \quad 4,480,000
\end{array}$$

$$c = \frac{400}{4,480,000} = \frac{1}{11,200}\ \mathrm{C} \qquad 10,000$$

Investigating the subject more closely, the following consideration clearly proves that the two arrangements of shunt are equally correct.

Referring to the examples worked out with the above formula for a K-V form of shunt, it will be seen that the efficiency of a meter was low; consider a motor-meter, denominator is a constant value for all positions of the slide contact; so that the current through the galvanometer is always proportional to $r_1(x + y + r_3) + x\,r_3$; in which $x + y = r_3$, viz., a constant value of 200, or $2\,r_1\,r_3 + x\,r_3$, *i.e.*, $2\,r_3\left(r_1 + \frac{x}{2}\right)$, or $400\left(r_1 + \frac{x}{2}\right)$.

For the ordinary simple universal shunt (fig. 3) where each coil has a resistance equal to two of the K-V coils (r_3) *when*

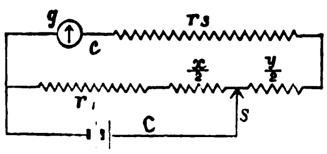

Fig. 3.

shunted with an equivalent resistance in the vernier coils $(x + y)$—that is only half their combined resistance *without* this parallel circuit—the two portions on either side of the contact s may be represented by respectively $\frac{x}{2}$ and $\frac{y}{2}$.

In this arrangement $r_1 + \frac{x}{2} + \frac{y}{2} + r_3 = 10{,}000^{\omega}$; and $\frac{x}{2} + \frac{y}{2} = 100$ vernier coils of 1^{ω} each.

For such a simple shunted galvanometer circuit, the fractional value c of the current passing through the galvanometer for any position of the slide contact is proportional to the shunt resistance, viz.:—

$$\frac{c}{C} = \frac{r_1 + \frac{x}{2}}{r_1 + r_3 + g + \frac{x}{2} + \frac{y}{2}}$$

[in which the denominator has a *constant* value].

Hence the current c through the galvanometer is also proportional to $r_1 + \frac{x}{2}$ as when the K-V slides are employed. As the resistance of the *ordinary* K-V slides ($100{,}000^{\omega}$) is, however, undesirably high for a universal shunt, it is preferable to reduce the resistance of all coils to $\frac{1}{10}$th of their usual value; viz., to a total of $10{,}000^{\omega}$, as for the examples worked out above.

Fig. 4 shows a modified form of K-V slides in which 101 coils of 100^{ω} each are arranged around the circumference of the central *vernier* slide having 100 coils of 2^{ω} each. The former are fixed and the latter can be moved bodily round on the circular ebonite slab to which they are attached,

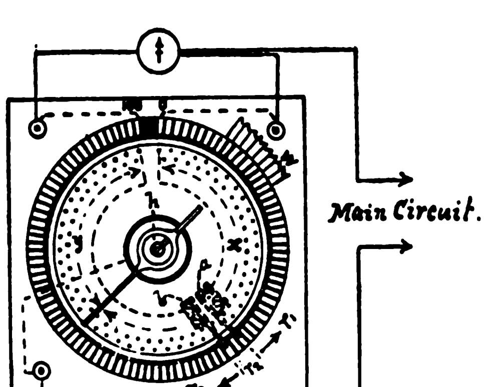

Fig. 4.

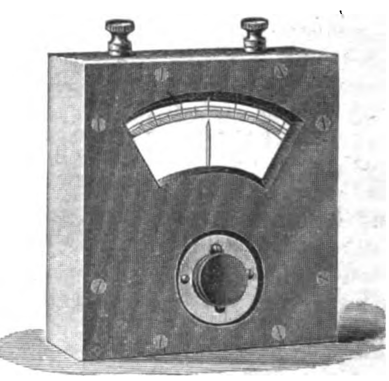
so that two radial spring arms, a and b, connected respectively to the 0 and 100 terminals of the vernier coils, press in their circular movement against platinum contact wires affixed to the top surface of the 101 segmental pieces to which the main resistance bobbins, as shown at W, are connected, and shunt *two* of them with an equal resistance (200^{ω}) in the same manner as the K-V slides provide for. The *vernier* slab is moved round by a central handle, h (the *vernier* contact meanwhile remaining on its zero stud) until the two radial spring contacts, a and b, reach a position which gives an approximately suitable shunt value, which can be more exactly adjusted, if necessary, by the vernier slide contact. This is moved round by the same handle, because the detent which before clamped it to the spindle rising from the centre of the ebonite slab is now withdrawn, so as to allow the vernier contact spring to be moved round freely without altering the position of a and b. Thus if 3,526 be the full shunt reading, 35 will be read off the brass segments outside and 26 on the vernier scale. The amount of friction with which the vernier slab moves round can be regulated by screws from outside the case.

DEAD-BEAT SENSITIVE INDICATING GALVANOMETER.

The want of a dead-beat sensitive *indicating* galvanometer has for some time been felt. There are so many purposes to which it could be put both in experimental and practical work, that the introduction of a cheap reliable instrument of this nature has become a necessity, therefore Messrs. Crompton, who have for some years past manufactured for use in their laboratory at Kensington Court, and to order, an instrument of the D'Arsonval or moving coil type, have



now decided to place it upon the market at a reasonable price. The instrument is as illustrated herewith, and can be supplied to any reasonable degree of sensibility, that usual with an instrument of 200 to 300 ohms resistance being a deflection of 1·75 millimetres with $\frac{1}{1000}$th of a volt applied to its terminals.

The same type of instrument can be supplied divided off as a milli-voltmeter or ammeter, so that by means of suitable shunts the instrument becomes direct reading in the matter of amperes or volts, or it can be calibrated direct as a low reading volt or amperemeter, its absolute dead-beatness enabling very fast work to be done. It is in this latter respect admirably suited as a "cell volt tester," in which case the zero is placed in the centre of the scale so that readings may be taken either side, so obviating the necessity of a reversing key.

ELECTRIC RAILWAY MOTORS.

It seems that the subject of Prof. Carus-Wilson's paper, on "The Design of Electric Railway Motors for Rapid Acceleration," has not been treated very rigorously from the experienced electrical tramway engineer's point of view.

In the first place the torque can be more conveniently expressed by the magnetic flux per pole, times the number of current turns opposite pole; this multiplied by the number of poles gives the total torque of the armature.

In the designing of motors for rapid acceleration it has been found necessary to get out a set of diagrams showing exactly the total effort required to produce a good acceleration, and have then designed a motor with proper torque to give this acceleration.

It does not appear that the question of the fly-wheel effect on the armature and driving wheels has been considered in determining the total starting effort. For rapid acceleration it is of the utmost importance that the moment of inertia of the armature and driving wheels be limited to the smallest possible amount. For this reason best traction practice has been directed towards diminishing the diameter of the armature. The first single reduction motors were built with an armature of 18 inches diameter, whereas at the present time motors of the same capacity have an armature of 10 inches in diameter, so that the effort to start the armature itself and the rotation has been tremendously diminished.

Another point we should have liked to see discussed in the paper is the difference between saturated and non-saturated motors for rapid acceleration. The saturated motor acts very much like a shunt motor, consequently the torque varies approximately with the current; whereas, with a non-saturated motor the torque varies approximately with the square of the current. Obviously then, for very rapid acceleration the degree of magnetisation has to be carefully considered.

Most traction motors built to this time have been very highly saturated, but this was brought about primarily from consideration of weight. When, however, such high accelerations as 2 or 3 feet per second have to be considered, it is found that the non-saturated motor, on account of its greater efficiency, gives greater acceleration for the same weight.

The paper will probably be of some interest to many members of the Institution, but those particularly interested in electric traction will, no doubt, expect a more rigorous treatment of the subject.

ALUMINIUM AND OTHER ELECTRO-CHEMICAL INDUSTRIES AT FOYERS.

A SPECIAL meeting was convened a few weeks ago by the London section of the Society of Chemical Industry for the purpose of receiving a paper by R. W. Wallace, Esq., Q.C., on the work that has been done by the British Aluminium Company at Foyers. Much of the information given in this paper is old news to most of our readers,* but it is all well and carefully put, Mr. Wallace by no means erring on the side of exaggeration; and a study of the paper cannot fail to be instructive as well as suggestive.

From our special point of view, perhaps the most important result of the operations at Foyers is that contained in Mr. Wallace's statement that the British Aluminium Company is able to produce electrical energy, including all costs and interest on capital, at less than one-third the cost that the same could be produced by coal and steam. To demonstrate this is an achievement of great significance, for not only will it enable many manufactures to be carried on under remunerative conditions, but it will attract capitalists to the exploiting of natural sources of power now running to waste, and result without doubt in their utilisation. The successes which have been achieved at Foyers will give a great impetus to electrical engineering generally.

Remembering that his audience was chiefly composed of chemists, Mr. Wallace touched rather lightly upon the engineering aspects of the industry at Foyers, and mainly concerned himself with an account of the electro-chemical industries which are carried on there. He discussed the history of aluminium at some length, comparing the various methods which have been from time to time proposed and worked. The process used at Foyers was carefully explained. Our readers are familiar with this, so we need not follow his description of it; we may note, however, his statement that the practical yield is 1 lb. of aluminium metal per 12 E.H.P. hours.

The aluminium industry is one of the most remarkable of modern times as regards rapid development. Just 12 years ago the total output of the whole world was about 5 tons. Even as late as 1890 only 40 tons were produced, and the price was £1,083 per ton. Last year 2,500 tons were produced, and the price was £148 per ton.

* See ELECTRICAL REVIEW for May 14th, 1897.

Mr. Wallace claims that the aluminium produced at Foyers is practically pure, though a large quantity is produced of a somewhat lower grade, namely, containing 98·5 99·0 per cent. of aluminium. The various chemical and physical properties of the metal were of course described, and amongst these we may notice that Lord Kelvin's latest results for the electrical resistance of aluminium (99 69 per cent. pure) show $6{\cdot}997 + 10^{-6}$ Board of Trade ohms per gramme-length (*i.e.*, for a length of wire weighing 1 gramme) at 0° C.; or 2 58 microhms per cubic centimetre. Taking Dewar's value for pure copper ($1{\cdot}563 + 10^{-6}$ Board of Trade ohms at 0° C.), the relative resistance of the aluminium becomes 165·3 per cent.; that is to say, its conductivity, volume for volume, is 60·5 per cent., and, weight for weight, double that of copper.

Mr. Wallace entered very carefully into the subject of the materials used in the industry, and defended the company against the charge of their having been unwise in their selection, not only of materials, but of the sites of some of their various works. He divided the various uses of aluminium into three general classes, pointing out that it may be employed alone, as an ingredient in alloys, and as a metallurgical re-agent in the purification of other metals.

At Foyers carbide of calcium is now made, and there is plenty of spare horse-power which may be utilised in the production of cyanides, chlorate of potash, sodium, caustic soda, carborundum, &c., not to mention phosphorus, the manufacture of which has left this country to go to Niagara. These and other processes require for their chemical success the use of cheap electrical energy. The cost of the power to produce this energy is the all important factor, and the experience of the British Aluminium Company gained from the development of the water-power in Foyers, proves that this power costs but a fraction of that produced from coal or any other known source. This statement did not pass without challenge in the discussion which followed, when one speaker pointed out that it had recently been claimed at a meeting of the Institution of Civil Engineers, that at the present price of coal in this country, it was possible, near the pits, to produce power cheaper than by water. Mr. Wallace replied very carefully to those who took part in the discussion, and stated that, with regard to the cost of producing electrical energy from coal and steam-power *versus* water, he could only say that, roughly speaking, the cost per horse-power at Foyers was about 30s. per annum, exclusive of interest on capital, whilst Prof. Kennedy had put the lowest price for producing it in Scotland, coal costing 3s. 6d. per ton, at £9 per horse-power per annum.

Mr. Wallace's paper certainly forms an extremely interesting *resumé* of work done in a new direction, which marks an epoch in the history of electrical enterprise in this country.

SOCIÉTÉ INTERNATIONALE DES ELECTRICIENS.

MONTHLY SITTING.

THE monthly sitting of the Société des Electriciens was held on May 4th, M. R. V. Picou then entering upon his duties as president. After the reading of the report, M. Picou made his speech. He promised to work for the good of the society, and spoke in praise of his predecessor, Dr. d'Arsonval.

M. LAPORTE then gave the results of some experiments which he had performed at the Central Electrical Laboratory on photometric standards. He studied first the Violle standard, and then the Carcel standard, and found that a decimal candle is equivalent to ·104 Carcel. He received some lamps standardised at the Electro-technical Institute of Berlin, and standardised them again himself. The results were as follows:—

	Electro-technical Institute.		Central Laboratory.	
	I.	II.	I.	II.
Difference of potential in volts ...	108 5	111 5	108·5	111
Amperes	·338	·489	·338	·487
Luminous intensity	10 hefner	16	8 7 candles	14·2

He then made various experiments on the Hefner and Carcel lamps and on the paraffin candle; he then compared the same incandescence lamp with a special standard, A, with a Carcel, with a Hefner, and with a paraffin candle, and found:—

·194 A
·341 Carcel
·72 Hefner
3·13 paraffin candle.

M. P. Girault then read a paper on "Commutation in Continuous Current Dynamos." He brought forward with regard to this question a series of somewhat intricate calculations which we cannot particularise here.

THE TELEPHONE INQUIRY.

The Select Committee of the House of Commons appointed to inquire into and report upon the question of the acquisition of the telephone service by municipal authorities, sat for the first time on Tuesday of last week for the purpose of taking evidence, Mr. Hanbury, secretary to the Treasury, presiding. The inquiries of the Committee are to be directed more particularly to the question as to whether the telephone service is, or is calculated to become, of such general benefit as to justify its being undertaken by municipal and other local authorities, regard being had to local finance; and if so, whether they should have power to undertake such service in the districts of other local authorities outside the area of their own jurisdiction, but comprised wholly or partially in the same telephone area, and what powers, duties, and obligations ought to be conferred or imposed upon such local authorities.

Sir Robert Hunter, solicitor to the Post Office, was the first witness, his evidence continuing throughout the whole of the sitting. Examined by the Chairman, he gave a history of the dealings of the Post Office with the various telephone companies. He said that in 1880 the Postmaster was advised that spoken communications by telephone were to be regarded as telegrams within the meaning of the Act, and an action was commenced—"The Attorney-General *v.* The Edison Telephone Company." In that suit it was decided that every organised system of communication by means of electricity, and any communication by means of wires, according to a preconcerted system of signals, was within the Act of 1869, and that telephones came within the monopoly enjoyed by the Post Office, and that every telephonic communication was a telegram. Immediately after that decision, licenses were granted to various companies by the Postmaster-General. The system at first was to grant a separate license for every district, but those licenses were only granted to a comparatively few companies. There was a limitation as to the distance through which telegrams should be sent. That system lasted until 1884. The licenses reserved the right of the Postmaster to compete within these districts, and no kind of monopoly had ever been granted by them. The companies had no special wayleaves, and had to take their chance with regard to them. Licenses were also granted for trunk wires. In 1884 representations were made as to the hardship of these restricted licenses, and it was then decided that all licenses should in future be general in their character, and should enable any body to whom they were granted to transmit telephonic communications anywhere within the United Kingdom. The consideration had always been that 10 per cent. of the gross receipts should be paid to the Post Office. In 1892 the Government announced another change of policy. After 1884 the telephone companies became gradually amalgamated, and at the beginning of 1892 practically all the telephone business of the country, both exchange and trunk wire, were in the hands of the National Telephone Company. It was not the only company in existence, but the others were comparatively very small. No limitation was imposed by Government such as that on gas and water companies. The telephone companies could make any charge they liked, and they could supply whom they liked, as opposed to the legislation with regard to the gas and water companies, which allowed only such charges to be made as were settled by Act of Parliament, and required that if a company raised its dividend it should lower its charges. There were no such limitations with respect to the telephone companies. On the other hand, the gas and water companies had specific powers for opening streets independently of the consent of the local authorities, which was not the case with the telephone companies. If the owner of a house refused to have a pole placed upon his property he thought the telephone company could refuse to serve him. In 1892 an arrangement was come to with the National Telephone Company and the New Company. The general principle of that arrangement was that the Post Office should take into its hands all the trunk wires and leave in the hands of the companies all the exchanges within areas. That policy was recognised by Parliament by the Telegram Act of 1892. The areas were composed originally of urban districts, and in addition there were tracts of country in connection with the urban districts where the telephone company had been carrying on business, and these were embodied in the deed. The next step was that the National Telephone Company sold to the Postmaster-General all the trunk wires outside certain areas, £459,000 being paid. By this arrangement the trunk messages practically came into the hands of the Government, the National Telephone Company having still the right to send messages within the exchange districts. They also had the right to telephone messages to the Post Office which were written down and sent as telegrams. If there was any recognised delay on the part of the telephone company in sending a message which came off the Post Office wires it would be a breach of their agreement with the Post Office, and the Post Office would have the right to remonstrate with the telephone company and to state what the remedy was. That would be a matter for grave consideration. He should think the National Telephone Company would say that there never was any undue delay. There was no proviso as to delivering a message within a specified time. If the telephone company put any difficulty in the way of the free use of their wires in connection with the Post Office that would be a breach of the agreement of 1892, and he had no doubt the Post Office would find a remedy.

The Chairman: It might occur all the same that the company would prefer to give precedence to a message sent by one of their own subscribers.

Witness said that would be a breach of their agreement. He thought it would be very difficult to frame a provision which would prevent a company in competition with the National Telephone Company from amalgamating with it or of being acquired by it. The New Company went into liquidation, and he thought he was right in saying that the secretary of the National Telephone Company was the liquidator. Originally it had been contemplated that the New Company should have precisely the same agreement with the Post Office as the National Telephone Company, but as the New Company was in *articulis mortis*, and were expected to surrender their agreement, they were informed that the Post Office would not interfere with their business in certain towns, as it would gradually die out. When Mr. Raikes was Postmaster he had a very strong feeling against the companies combining, and was very anxious to keep up competition amongst the various companies, but he found he could not prevent the amalgamation. There was a very strong feeling on the part of Mr. Raikes that these amalgamations ought not to be permitted. In 1892 the principle was laid down that fresh licenses should not be granted substantially without the support of the municipal bodies. Up till then licenses had been granted freely without difficulty. In Mr. Raikes's time opinion was taken as to whether the Post Office could prevent the amalgamations, and they were advised that they could not do so. With regard to competition, the Postmaster-General was perfectly at liberty to establish competition in any exchange area, and he was perfectly free to grant licenses to any other body in any area.

The Chairman: We have got the fact that the company has no limit to its rights, and there is no provision as to any preferential rights.

Witness said that was so. The National Telephone Company's rights terminated on December 31st, 1910. On that date their rights terminated and they had no business to dispose of.

Assuming that the year 1911 is reached and the Government had not bought up the company, what is the position of the National Telephone Company in the face of the Post Office?—In the first place the license absolutely lapses.

Is the Postmaster under obligation to buy any portion of the plant?—None whatever, and on the other hand there is no power of buying it compulsorily; the two parties are absolutely like ordinary persons, two parties to a bargain.

In 1911 the license will have ceased. The National Telephone Company could no longer send messages and therefore could not use its plant.—Quite so.

The only person who could buy the plant to put it to any probable use would be the Government, and they are not under obligation to buy any portion of it?—Not the least.

Witness continuing, said the Postmaster-General had power to purchase the business of the National Telephone Company in 1904, provided he gave notice of that purchase, and in the case of difference as to the price the matter was to be determined by arbitration. In the agreement of 1896 there was a special provision that it should terminate at the same time as the original license, and upon the purchase any additional powers derived under the agreement of 1896 shall not be property to be purchased by the Postmaster-General. The Postmaster-General derived his wayleaves power from various Acts. He had power to place his telegraphs either over or under roads with the consent of the local authorities. If the local authorities refused such consent, there was an appeal to the police magistrates, or the justices, and a further appeal to the High Court. This provision applied all over the country, England, Scotland and Ireland. The Postmaster-General always objected strongly to paying any rent for poles. Of course, in the case of private property, the Post Office was in the hands of the owner, and if he would not let them place the poles on his property, they could not do it. They could put up telegraphs on a public road in the country without the consent of the local authority, but in other places the consent of the local authority was necessary. Speaking generally, the Post Office could not make any attachment of wires or erect posts on private property without the consent of the owner. In the country they could not take a wire over private property without the consent of the owner, but in towns, when the Post Office had obtained the consent of the road authority for carrying wires along the street, then they could carry the wires over the property of private owners. The Post Office had an exclusive wayleave over most of the important lines of railway, and also over the canals. Over some lines of railway the Post Office had a wayleave, but it was not exclusive. The telephone companies had no right over the railways, or over private property, except that, assuming they had attachments on opposite sides of the road, they could carry their wires over without the consent of the local authority, provided they did not interfere with the use of the road. If they had the consent of the local authority, they could not then use the roads. It was the law that no obstruction could be made in the road, even with the consent of the local authority, except under Act of Parliament. It had been decided that the erection of poles upon the greensward at the side of the road, even with the consent of the local authority, was not permissible except under Act of Parliament. Up to 1892 there ought not to have been any wires laid under the ground by the company. Strictly speaking, there ought not to have been any overhead wires either, though he believed there were. Before 1892 they had practically no wayleaves at all, except over private property with the consent of the owner. In 1892 they got certain rights of wayleaves. It was part of the arrangement that the Postmaster-General should be empowered to grant his license to exercise the same powers he had. There was no special consideration of this; it was part of the arrangement as to the trunk wires and exchange areas. In 1892 the Act was passed authorising the Postmaster-General to give the companies wayleaves, but they had no authority to exercise wayleave power until 1896. The Act referred not merely to the National Telephone Company but to all licensees. The National Telephone Company on more than one occasion endeavoured to obtain wayleaves from Parliament before 1892, and these Bills were opposed by the Postmaster-General on the ground that it was not desirable licensees of his should have an independent statutory provision. The powers the National Telephone Company applied for were really stronger than any the Postmaster-General had. The National Telephone Company could not exercise any wayleave powers except under the special license of the Postmaster-General.

What are the powers which the Postmaster-General is authorised to give to the National Telephone Company, or any other company? —Just the same powers as regarded roads, buildings, and towns, and so on, as he himself possessed, but these powers were qualified by provisos. The fact was, that the powers the Postmaster-General gave could only be exercised in an urban sanitary district or such area adjoining as was prescribed in the license. The second proviso was that the licensee should not exercise any power without the consent of the County Council, or other authority, and should be subject to such terms as they might exact. Another condition of the Act was that the Postmaster-General should not give any wayleave powers over the railways or canals. The Postmaster-General was under contract to give the National Telephone Company all he could give under the Act. In London the company would have first to get the consent of the London County Council and then of the road authority. Any authority could say that as a condition of giving their consent the charge to subscribers should be reduced to, say, £5.

Take the case of Glasgow. Supposing the company wanted to lay underground wires between its exchange and the house of a subscriber, what is the position of the company?—They would first apply to the Postmaster-General for the authority to exercise wayleave powers. Having obtained that they would apply to the Glasgow Corporation for leave to exercise the powers obtained from the Postmaster-General.

With regard to the National Telephone Company is it the practice to do that?—It is. The Glasgow Corporation could make any condition they pleased. This would be by virtue of their right to refuse the original consent, and there would be no appeal. They would not refuse the Postmaster-General in the same way, because he would not apply to them generally, but only for the right of a particular street, and then if they refused he would appeal. If the Corporation or County Council refused a general consent, no company had any right whatever to lay wires between the exchange and a subscriber's house. The London County Council might give this general permission, but as regarded laying the wires between the exchange and the subscriber's house the company would have to get the further authority of the Vestry or District Board subject to appeal. As to the wires between two exchanges of the company, both in the Treasury minute of 1892 or the agreement of 1896, there was a special provision. The Treasury minute said that the Post Office would provide underground wires so that the local authorities might not have to complain of their streets being disturbed. In pursuance of that announcement of policy in the deed of 1896, the Postmaster-General covenanted so far as practicable to connect by underground wires any wires of the company in the same exchange.

The Post Office would not have the power to take up the streets and lay a wire for the company between the exchange and the subscriber's house, how does it get the power to lay a wire between exchange and exchange?—I don't know that there is that power. They contended that the Postmaster-General was the judge whether he wanted a wire, it was not for the local authority to deal with.

Do you contend that the Postmaster-General would have the power to take up the streets between the exchange and a subscriber's house without the permission of the local authority?—No! He would have to go to the local authority in any case, subject to appeal the Post Office would claim the right to lay their wire from the exchange to a subscriber's house, and that would be discussed on appeal. The Post Office had never contemplated such a thing, and therefore the question had not arisen. The Post Office had laid wires for the company between exchange and exchange, and between exchange and Post Office. The Post Office could exercise on behalf of its licensees all the rights and privileges it could exercise for itself, subject only to the right of appeal against the local authority.

By Sir J. WOODHOUSE: If the Postmaster-General undertook to lay wires for the company and the local authority declined to give its general consent, then the Postmaster could appeal against the refusal. The Post Office in their covenant had undertaken to lay wires between the exchanges for the companies.

So that you are enabling the company to get behind the consent of the local authority?—We were bound to do so under our covenant.

By Sir HENRY HOWORTH: There was nothing in the agreements between the telephone companies and the Post Office to prevent the former from charging differential rates. The Post Office do not enter into their charges except to see that they paid over the 10 per cent. of the receipts. The National Telephone Company claimed to have the right to exclude a private individual from the supply. There was nothing in their arrangements with the Postmaster-General to prevent it. There was nothing to prevent the Postmaster from granting a license to another company to work within the same area.

By Mr. TULLY: The Post Office had always made it clear to the National Telephone Company that the Post Office was perfectly free to grant competing licenses at any time. There had never been any substantial competition with the National Telephone Company.

By Mr. BARTLEY: A corporation with a license from the Postmaster-General, and with authority to exercise his rights of wayleave, could take up its own streets for the purpose of laying telephone wires; but without the license the corporation could not so act. The telephone companies were in possession of lines all over the kingdom, and the Post Office had to acquire them, and if they had made certain conditions the telephone companies would have said, "Well, we will go on as we are."

By the CHAIRMAN: In the case of a company determining to work the telephones it would have to get from the Postmaster-General the authority for wayleave powers, then if it were carrying on business within its own area of course there would be no veto on the part of the local authority, because the local authority possessing the veto would be the same. Then as to taking up the streets, in the majority of cases the road authority would be the same body. Therefore, there would be free control of the streets. In the case of a municipality carrying on business outside its own district, in some other borough, for instance, it would be in the same position as the National Telephone Company. It would have to get permission to go into the borough, and if it was granted it would have to go to the road authority to get its consent to take up the roads, and if that were refused it would have to go to the tribunals. In its own area it would to a certain extent adjudicate on its own case. He did not see any legal difficulty in the way of judging their case as suggested.

The Committee adjourned until Thursday.

The Committee of the House of Commons sat for the second time on Thursday, 19th inst., Mr. Hanbury, the chairman, presiding.

The CHAIRMAN, at the opening of the proceedings, said the Committee had been considering an application from the National Telephone Company and from the Direct Telephone Company to be heard by counsel, but the Committe were unanimous in the opinion that they could not accede to the application.

Sir HENRY HUNTER, solicitor to the General Post Office, again attended, with the object of supplementing the evidence given by him at the former sitting. He said that on that occasion Prof. Stuart had raised a question as to whether London came within Section 5 of the Telephone Act of 1892, and had suggested that the words there used were not wide enough to cover London. He (Sir Henry Hunter) read the section in question, and said that in his opinion London came within the meaning of the words "urban sanitary authority." With regard to the suggestion that the Treasury Minute of 1892 contemplated competition between various telephone companies, and that all the enactments in the Telegraphs Act, 1896, were authorised and passed in contemplation of competition, he said that the draft agreements between the Post Office and the National Telephone Company and the New Telephone Company were laid before Parliament. It appeared from the debate that followed, and from the minutes of the Select Committee, that the National Telephone Company had absorbed the New Telephone Company. The Committee reported in July, 1895, and the agreement with the National Telephone Company alone was entered into on March 25th, 1896. On August 19th, 1896, the Act was passed which authorised the raising of an additional £300,000 to carry out the policy of handing over the trunk wires to the Government and leaving the exchanges to the companies. The point was that he thought it was perfectly well known that there was only one company, and that the business would be practically divided between that company and the Post Office, and that Parliament granted additional money with that knowledge.

Sir HY. HOWORTH: Was it not granted for the purchase of plant actually in existence at the time?—The preamble to the Act of 1892 stated that it was expedient to raise money with a view of carrying into effect the scheme of the Post Office for acquiring the telephones, and particularly with a view of raising money for the trunk lines. The Act of 1896 said the Treasury might issue a sum not exceeding £300,000 for the Postmaster-General's use for the purposes of the Telegraph Acts, and he submitted that that was an express confirmation of the policy outlined in 1892 of buying up the trunk wires in 1896, and that it was known that there was only one company.

By Mr. GRIFFITH-BOSCAWEN: The £300,000 was solely for the purchase of the trunk wires.

By the CHAIRMAN: His evidence went to show that Parliament was duly seised of knowledge that the two companies had become one at the time. It was moved in the House of Commons that the agreement should not be confirmed, and the mover based his case upon the fact that the National Telephone Company had absorbed the New Telephone Company, and that there was practically only one company, and the Government was carrying out a bad policy when there was only one company. The arrangement was solely in reference to trunk lines. Parliament was aware at the time that there was no competition, apart from the Post Office, with the one company, and it might have challenged the policy of the Government when this money was granted.

By Mr. TULLY: The agreement was not executed until 1896. He did not think there was any understanding on the part of the Government and the Post Office that the execution of the agreement should be suspended.

By the CHAIRMAN: With regard to the trunk wires, he had said on the last occasion that he thought that if the National Telephone Company gave preference to the messages of its subscribers, that would be a breach of the agreement. He had since referred more closely to the agreement of 1896, and had found that there was a distinct covenant on the part of the company that they would do everything to enable messages to be carried over trunk wires, not only between their own subscribers but between subscribers to other exchanges also.

By Mr. Bartley: To postpone the sending of other messages in favour of those of their own subscribers would be a breach of the agreement, as that was over the trunk wires.

By the Chairman: In 1884, when the form of the new license was being debated, it was considered whether the Government should insert in that license a clause preventing the Telephone Company from giving favour or preference to one over another. It was eventually decided not to insert such a clause. The reason was obvious. At the time of the draft public opinion was in the direction of giving the telephone companies a free hand. Up to that time the Post Office had imposed a great number of restrictions, and it was proposed to remove all these restrictions, and give the telephone companies a free hand.

By Mr. Cohen: His opinion was that if the Telephone Company gave preferential treatment to their own subscribers they would not be carrying out their contract. They would be deliberately delaying a message, and would not be doing all the necessary acts and things to carry out the agreement.

Prof. Stuart: Would a breach of that clause by the company entitle you to revoke the license?—I think not, but we could bring an action against them.

Do you think it completely safeguards the public in that respect?—I think so.

Do you mean to say you think the Telephone Company would object to words being put in to prevent them by any possibility giving preference to their own subscribers?—I really cannot say. All these questions were minutely considered at the time. He would not say that these particular words were considered, but the whole of the arrangements between the Post Office and the company were most elaborately debated. He thought the clause he had referred to was sufficient to safeguard the interests of the public.

By the Chairman: Preference in time would constitute a branch of the agreement, but he could not say that a preference in rates and charges would do so.

I do not see where the difference comes in.—They must not do anything that delays one message for another.

Surely the principle of preference applies to rates and charges as well?—That was not dealt with.

I want to get it clearly that the preference in time of one person over another would constitute a breach of the agreement, but the preference in charges would not.—I do not think it would.

By Mr. Fry: The breaches which would entitle the Post Office to determine a license would be the non-payment of the royalty and the sending of messages out as telegrams, writing them down as telegrams.

By Prof. Stuart: No doubt these were points to secure the specific interest of the Post Office, not points to protect the public. There was no intention in the agreement to fix the rates the company should charge. He would not say the question of preference was considered from this point of view when the agreement was drawn, but it was considered. He did not think that the company would have submitted to any restriction on the way in which they were carrying on their business as between themselves and their subscribers. The view in 1884 was that the telephone could be best dealt with by throwing it open to free action.

How is it the Post Office can give its licensee the power of charging preferential rates which, by law, it does not possess itself?—The Post Office did not give its licensees the right of making preferential rates. All that the Post Office did by its license of 1884 was to remove the restrictions which would otherwise make every telegram which was transmitted illegal. But for that, all these telephonic messages would be illegal. It was thought in 1824 that the best thing to do was to leave the companies open to make any terms they liked. There was nothing to prevent the company giving a preferential rate to a man doing a large business over one doing a small business. Whey they got their exchange license it was thought better to give them a free hand. From 1892 to 1896 it was a matter for negotiation. The Government could not make the companies accept any terms they thought fit.

By Mr. Bartley: He would rather not give any opinion as to whether it was fair that the same restrictions should be imposed upon the companies as were imposed upon the Post Office. As to whether it was right that they should have privileges which were not possessed by the Post Office, it seemed to him a question of policy.

By the Chairman: The question of policy was fully considered in 1884. He would prefer that Mr. Lamb should answer the question as to whether it was considered in 1892.

Mr. F. T. Lamb, second secretary of the Post Office, examined by the Chairman, said his special department was the telegraph and telephone service. He was in charge of the telegraph department, which position he had occupied since April, 1889, and for many years before he had had a great deal to do with it. He had been concerned in the administration of the telegraphs since 1870. He gave evidence before the Committee of 1892, and also before that of 1895. The principal recommendation of the Committee of 1892 was that the license of the Telephone Company should not be extended beyond 1911. It left the Government the responsibility of entering into arrangements with the telephone companies, and made that recommendation that the license should not extend beyond 1911. He had a hand in drawing up the Treasury Minute, in the sense that he prepared the information for the Post Office, which was embodied in that minute nearly word for word. That information was prepared in view, at any rate, of limited competition. All along the Post Office and the Treasury had in view competition, and freedom of competition was reserved carefully from the earliest date, and it was again reserved in that minute. In 1892 agreements were drawn up. They were not signed, but they were initialled by the Postmaster-General and the representatives of the two companies. That was in August, 1892. The Postmaster-General, Sir James Fergusson, initialled them on behalf of the Government. The Duke of Marlborough initialled one document on behalf of the New Telephone Company, and Mr. Forbes the other document on behalf of the National Telephone Company on August 11th, 1892. The heads of the agreement so signed were embodied in the agreement of March 25th, 1896. The final agreement was with one company.

Did the Post Office encourage the amalgamation of these two companies? - It was not a question of the Post Office. It was a question of the Government, who gave direct instructions to the Postmaster-General. The Postmaster-General was in constant communication with the Chancellor of the Exchequer, and acting for the Government, he facilitated the amalgamation of these companies. Practically, the amalgamation had taken place when the heads of the agreement were signed.

In 1889 Mr. Raikes was Postmaster-General, and offered strong opposition to the amalgamation. Was the same opposition offered by the Postmaster-General to the amalgamation in 1892?—No, certainly not. Not only was there no opposition to amalgamation, but it was rather encouraged; but that was not the Post Office, but the Postmaster-General acting on behalf of the Government. The agreement undoubtedly facilitated the amalgamation of the National Telephone Company with the New Telephone Company, and was signed with the full knowledge of the Chancellor of the Exchequer and, he believed, other members of the Government. The formal signatures were attached on August 11th, 1892, in Sir Jas. Fergusson's room in the House of Commons. He would not say that the Ministry had authorised an agreement which was contrary to the Treasury Minute issued in March, 1892. He was in constant attendance at the House of Commons with the Postmaster-General, and was present at discussions, and he knew that the Postmaster-General acquainted the Chancellor of the Exchequer of what was going on.

The examination of the witness had not concluded when the Committee rose.

CORRESPONDENCE.

Limerick Electric Tramway Scheme.

As a subscriber to your esteemed periodical, which I regularly receive through your Berlin agency, I take the liberty to put the following before you.

In your number (No. 1,067, May 6th, 1898, page 622) I find this notice:—

"*Limerick.*—The firm of Zietz, of Hamburg, are stated to have written to the Corporation in quaint English, offering to establish an electric tram system all over the city, 'without any cost, on getting a lease of the streets.' This is cool! We guess many an English promoter would like to get tramway concessions on these terms."

There is no doubt that my firm is alluded to, and as I cannot allow to be ridiculed in anybody's eyes, I beg to hand copy of two letters, which are the only ones I addressed to the Corporation of Limerick, and from which you will learn that there is nothing like any "cool offers," but only a commercial offer of my services.

As to the Liverpool order you refer to just under the Limerick notice, I beg to state that same was given to me, respectively to my friends the Wagenbauanstalt und Waggonfabrik für Elektrische Bahnen (vormabs W. C. F. Busch) of our place.

As it cannot be in the interest of your Review to give any wrong information, or to allow anybody to ridicule any of your subscribers or to harm their interests or position, I should thank you to make use of my to-day's information in such way as you may think fit.

Ed. Zietz.

[copy].

To the Town Clerk
Of the City of
Limerick (Ireland).

Sir,—I take the liberty to inform you that I have provided the Liverpool Tramways Corporation with some samples of *Cars for electric traffic*, completely fitted out.

The respective Committee will visit this city at the beginning of March to look over our electric car traffic, which is the best and largest on the Continent, as we are running about 700 cars with overhead system.

Supposing that ere long your Corporation also intend to transform your horse tramcars into electrical cars, I beg to offer you my services for anything you may require to this purpose. Any details will be given with pleasure on application.

Hoping to be favoured with your reply.

I am, Sir,
Yours respectfully,
(Signed) Ed. Zietz.

[COPY].

Hamburg, *April 22nd*, 1898.

To the Town Clerk
Of the City of
Limerick (Ireland).

Sir,—Referring to my respects of February 19th, I beg to inform you that since then the Liverpool Committee have inspected our electric tramcars traffic, and that at the meeting held at Liverpool a resolution has been taken to order from me for their trial line 14 *motor cars and* 14 *trailer cars fully equipped*. This order gives you a full proof that I am in the position to provide you with the necessary, and I am looking forward to your good news.

Yours respectfully,
(Signed) Ed. Zietz.

[Our brief comments were made on the information—now shown to be very meagre—received from a local source. The correspondence printed contains no mention of terms proposed by Messrs. Zietz, therefore the reference to cost and lease seems to be a mere fabrication of the Irish mind. We offer our apologies to our correspondent.—Eds. Elec. Rev.]

Testing of Magnet Steel in Bulk.

With reference to the point raised by Mr. Mordey in the discussion on Prof. Ewing's paper on the importance of knowing the magnetic qualities of soft magnet steel in bulk. It would appear that the variations in magnetic quality has much improved of late owing to the steel makers having come to the conclusion that it pays them to make special blows of steel instead of using any mixture they may have in hand at the time.

The South Staffordshire Steel and Ingot Company, for example, who turn out very large quantities of soft magnet steel appear to have found out exactly what is wanted, and by taking a little trouble with the mixture and with the chemical analyses, the quality is practically constant for each "magnet steel blow," which they now make at frequent intervals. At the same time it would undoubtedly be a great advantage for electrical firms to be able to make their own tests of the magnetic quality of castings and ingots *in bulk*, and in the absence of any such method, the writer thinks that perhaps the following suggestion may be interesting:—

An electro-magnet similar to those which are now taking the place of crane hooks, but with tapered and rounded poles, is suspended over an ordinary weigh table. When the ingot or casting comes forward to be "weighed in" by the the stores department, two places are fettled up at, say, a foot apart, for the electro-magnet poles to rest against. After the casting has been weighed in the usual way, the magnet is brought against it and a known current is switched on. The weights are then run off the scale beam in the weigh office until the casting drops away from the electro-magnet.

It seems to the writer that this is roughly analogous to the traction method of testing as used in Prof. Ewing's instrument, and that the difference between the actual weight and the weight at which contact is broken is a measure of the magnetic quality of the steel lying adjacent to the pole-pieces of the electro-magnet.

E. Kilburn Scott.

The South Staffordshire Steel and Ingot Company, Limited, turn out over 50 tons of soft magnet steel per week in ingots, &c., weighing up to 7 tons each. The following is the average chemical analysis:—

Carbon	·075 %
Manganese	·380 %
Sulphur	·075 %
Phosphorus	·060 %
Silicon	trace.

"Honour to whom Honour is Due."

An article in your issue of last week, entitled "Honour to whom Honour is due," seems scarcely fair to James Wimshurst. Since 1775, when Volta invented the electrophorus, induction machines have, by common consent, been named after those who have introduced improvements in the mechanical and electrical details of the development of the cardinal idea. Thus, Toepler and Carré, Kelvin and Varley, are all credited with having invented induction machines; and induction machines have been named after them. In all these cases the right and honour of invention goes to the man who fashions a machine qualified, by its details, for specific purposes, or for convenience in its mode of operation.

Experiment has determined that the machine made by Wimshurst possesses the following *simultaneous* characteristics: (1) It is self-exciting. (2) Its polarity is subject to no capricious reversals. (3) It does its work well in all weathers. (4) Its discharges can be regulated as to quantity, potential, and rate of interruption. (5) It is, for some purposes, the best possible exciter for Röntgen-ray tubes (see *Proc. Röntgen Soc.*) and allied phenomena. It is upon these *simultaneous* characteristics that the right and honour of invention is ascribed to him.

The skeleton figure, accompanying your article, no doubt represents the best that could be attained before 1883. But, unfortunately for your argument, that machine would not possess the *simultaneous* characteristics (1) (2) (3) (4) and (5). We can afford to give Prof. Holtz much credit for his work, but the merit of having invented the "Wimshurst" machine should no less be given to our own esteemed countryman, James Wimshurst.

Rollo Appleyard.

May 23rd, 1898.

Alternating Arc Lamp.

I have been experimenting with an alternating arc lamp, and find my greatest trouble is that the current has a tendency to run up the side of the carbon. Could you or any of your readers inform me any means of keeping this down, and the cause? Is it the quality of the carbon, or the E.M.F. in the too (?) high which is 72 volts at 7 amperes, 13 mm. cored carbons are used? This lamp burns fairly steady till it flares, when the light changes from a white to a violet colour for the instant. The lamp burns at 100 volts on its terminals, no impedance coil is necessary, and I am therefore anxious to get it to burn steady. I shall be much obliged if I can obtain any information.

W. Addley.

[Our correspondent has apparently left out the word "arc."—Eds. Elec. Rev.]

THE "HART" SECONDARY BATTERY.

We announced a few weeks since that Mr. E. J. Clark had left the Electrical Power Storage Company to take the management of the business of the "Hart" Secondary Battery Syndicate, Limited. At that time the Syndicate had just taken possession of premises at Crispin's Wharf, Stratford, London, which, though admirably adapted for its purpose, required a considerable amount of fitting up. That the Syndicate is now in a position to execute orders indicates the possession of energy which deserves success.

At present arrangements have been made to manufacture three types of battery, namely, for traction, lighting, and central station purposes. The traction cell consists of 11 plates, weighing 38 lbs., with a capacity of 150 ampere-hours at a discharge of 50 amperes, equal to ·4 H.P. for one hour. The lighting type has a capacity of 40 ampere-hours per positive at a discharge rate of 15·6 amperes; at half rate a capacity of 55 ampere-hours. The central station cell is constructed to meet the demand of consulting and central station engineers for a battery that will stand a very heavy discharge for a short period. The plate is calculated to sustain a discharge at 100 amperes for one hour, as a maximum, and at the same time leave a safe working margin.

With all kinds of cells a novelty is supplied in the shape of a non-corrosive connection decreasing the resistance and saving much trouble in cleaning.

The principal improvement claimed in connection with the construction of the plates is that by some process not explained, the active material is hardened and does not suffer disintegration under heavy strains.

The plates for the traction cells are also provided with an additional protection to the active material, little lugs being arranged so as to fold over and hold the contents of the plates in rigid position.

By decreasing the weight of the grids and increasing the proportion of active material as compared with the inactive, it is claimed that for a given weight of cells at least 40 per cent. is gained in capacity.

With respect to the Syndicate it is composed of some of the leading public men in West Ham and the neighbourhood, and is putting down plant for an output of 6,000 or 7,000 plates per week. The works are very favourably situated just off the main Stratford Road, with a canal by which heavy material can be brought to the gates. Every department is well lighted, and all the operations can be carried on under healthy and wholesome conditions.

Alleged Fraud.—At the Manchester City Police Court this week Thomas Scott was charged with obtaining sums of money from Manchester tradesmen by false pretences, among them being Mr. Geo. Margetts, manager for the district of Drake & Gorham. Prisoner was remanded.

Cable Making in Germany.—A company has just been formed in Berlin, with a capital of £300,000, to be known as the See-Kabel Gesellschaft, to manufacture electric cables, and to acquire and carry on the works and business of Herr Franz Clouth at Nippes.

Cowper-Coles Parabolic Reflector.—A sole license has been granted to MM. Sautter, Harle & Cie, of Paris, for manufacturing parabolic reflectors by this process for searchlights in France, Russia, and Spain.

Dissolutions of Partnerships.—Messrs. F. Reid, F. S. Reid & W. H. Ferens, carrying on business as electrical engineers and agents, at Newcastle-on-Tyne, under the style of F. Reid, Ferens and Co., have dissolved partnership by mutual consent. Debts will be attended to by Messrs. F. Reid & W. H. Ferens, who will carry on the business under the old style.

Messrs. B. Wild, J. H. Clarke, and W. Rothwell, carrying on business as general electrical engineers at 6, Virginia Street, Southport, as Wild, Rothwell & Co., have dissolved partnership by mutual consent. Debts will be attended to by Messrs. Wild and Clarke.

Drake & Gorham Electric Power and Traction (Pioneer) Syndicate, Limited.—In order to deal with the motive power transmission schemes and light railways and tramways which are brought to Messrs. Drake & Gorham in the course of their business, they have formed a powerful syndicate to deal with the preliminaries, and arrangements are being made for a company with a capital of about £250,000. Mr. J. F. Albright, late managing director of Crompton & Co., has joined the syndicate as joint managing director with Mr. Drake, and the syndicate is already in negotiation for acquiring several important schemes for electric traction, power transmission, &c. To avoid misunderstanding, we are asked to state that, while the name of the syndicate is the Drake & Gorham Electric Power and Traction (Pioneer) Syndicate, the business and organisation are quite separate from Messrs. Drake & Gorham's own business, and the syndicate will deal direct with any persons, firms, or local authorities who may wish to negotiate for the promotion or financing of electric traction or power schemes. Offices have been taken at 66, Victoria Street, Westminster, to which all inquiries should be addressed.

Devon County Agricultural Show.—At the above show, which was opened last week at Newton Abbott, Messrs. Lord and Shand, electrical engineers, of Plymouth, shewed a number of electric motors driving a variety of agricultural and domestic machines, such as cream separator, chaff cutter, coke crusher, and horse clipper. The necessary current was obtained from a Taunton dynamo, driven by a Hornsby-Ackroyd oil engine exhibited by Messrs. Beare & Sons, agents at Newton Abbott. The current was supplied to two 1½-H.P. Taunton motors, manufactured by the Newton Electrical Works, Limited, and 10 Lundell motors of various sizes by Messrs. Veritys, Limited.

Electric Clock Switches.—We understand that Messrs. James & Browne have just despatched a dozen of their patent automatic electric clock switches for use in the arc lamp standards at Exeter. A description of these switches, which are for automatically putting current on and off at any desired time, appeared in our issue of February 18th last.

Electric Power in Shipyards.—An installation of electrical transmission of power has recently been carried out by Messrs. W. H. Allen, Son & Co., of Bedford, at the well-known shipbuilding yard of Messrs. Harland & Wolff, Limited, of Belfast, comprising a direct current 500-volt belt-driven generator, and five motors, varying in size from 12 B.H.P., all of Messrs. Allen's manufacture. The generator is compound wound, and the motors shunt wound, whilst the cables run for a distance of 100 yards on steel tubular poles. Messrs. Allen have now secured an additional order from the same firm. This new installation will be one of the largest of its kind in the United Kingdom when completed, and will consist of a 550 I.H.P. compound three-crank forced lubrication engine, running at 300 revolutions per minute, direct coupled to a three-phase 350 kilowatt generator. There will also be seven three-phase motors, four of 100-H.P., one of 75-H.P., one of 50-H.P., and one of 20-H.P., distributed throughout the shipyard for driving the various departments.

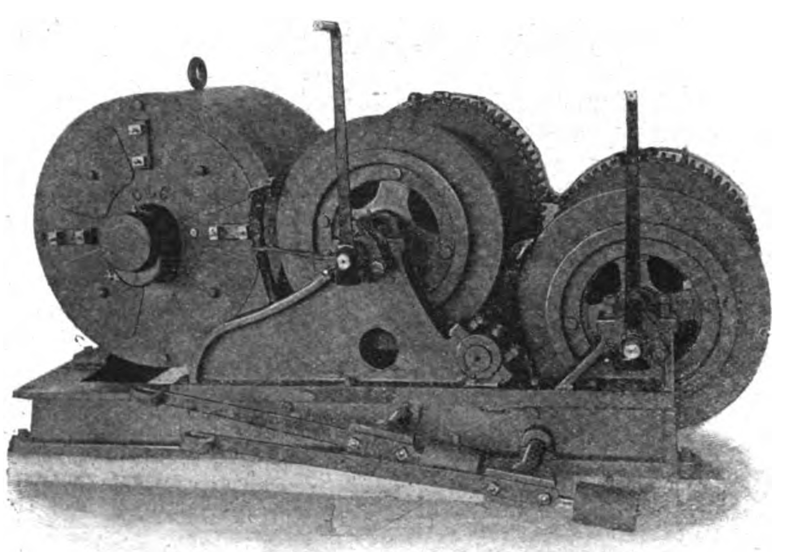
The Electrophone.—The Princess of Wales and Princess Victoria upon two evenings last week listened to the leading London theatres through the electrophone which is installed in the private boudoir of the Princess of Wales at Marlborough House.

Hammond v. The Electricity Supply Company for Spain, Limited.—This was a motion on the part of Mr. Robert Hammond, the plaintiff, heard before Mr. Justice North in the Chancery Division, on Tuesday, to restrain registration of a transfer of shares in the defendant company, of which he claimed to be beneficial owner. The defendants, other than the company, were Don Pedro Pastor y Landero, the transferor, and Mr. R. C. Wyatt, the transferee. Owing to the fact that the Spanish Government would not permit service of a concurrent writ on Don Pedro Pastor y Landero, who is in Spain, it appeared the plaintiff had not been able to bring him before the Court, and the motion therefore stood over. Mr. Kirby was for the plaintiff; Mr. Martelli for the defendant, Wyatt; and Mr. K. H. Leach for the company.

London County Council and the Smoke Nuisance.—At the weekly meeting on Tuesday, the Public Control Committee brought up a report in reference to the smoky atmosphere of the metropolis during the past few weeks. In this connection the committee mentioned that they had addressed to 23 Vestries and District Boards a letter stating that many complaints have been made during the past few weeks of the "very serious nuisance caused by the emission of black smoke in large volume from chimney shafts in various parts of London. The nuisance has probably been most serious in the central districts, and has largely proceeded from electric light generating stations and hotels. The cause is almost invariably attributed to the difficulty now experienced in obtaining smokeless coal, and to the consequent necessity of using bituminous coal in the furnaces of steam engines. If this difficulty had proved to be of a very temporary nature, it might not have been desirable during its continuance to strictly enforce the law as to smoke consumption, but it has already lasted upwards of six weeks, and there appears to be no indication of its speedy cessation. Meanwhile the most serious inconvenience continues to be caused, apparently without any attempt being made to mitigate the evil, notwithstanding that by proper precautions and careful stoking, much of the nuisance might be prevented. In some districts legal proceedings have already been instituted, and the Council believes it to be necessary in the public interest that steps should now be taken for strictly enforcing the law in every serious case which may occur." Sir Harry Poland moved that the report should be referred back, in order that the committee might bring up a recommendation with a view to stopping the nuisance. Mr. Lawson, who seconded, suggested that the Council should initiate legislation next year in order to deal with the question. Mr. H. Ward attributed the large volumes of dense smoke to the fact of the steam at the electric light stations not being condensed. The result was that the steam was discharged into the stacks, and assisted in driving the carbon particles into the atmosphere. On a show of hands, the report was referred back to the

Committee by 23 votes to 21. The Council approved on the recommendation of the Building Act Committee the plans submitted for the extension of the Carnaby Street station of the St. James's and Pall Mall Electric Lighting Company. Formal consent was given to the laying of new mains by the Metropolitan, the House-to-House, and the County of London Electric Lighting Companies.

C. & C. Electric Hoist.—The hoist shown in the illustration was supplied to Messrs. Belshaw & Co., of Victoria Street, by the C. & C. Electric Company, of New York, through their representative for the United Kingdom, Mr. C. R. Heap, 47, Victoria Street, London, S.W. The motor, which is stated to possess several novel features, is of the "C. & C." direct current (compound wound and over compounded) ironclad totally enclosed four-pole slow-speed type. It develops 40 H.P. on the brake, with 450 volts at the terminals, running at a speed of about 750 revolutions per minute. The hoist is of the double drum type. Either drum may be worked independently in either direction, there being a separate friction clutch, brake, and reversing gear for each. Thus raising or lowering may be accomplished as required by either drum. The duty of the machine is to raise 1 ton plus the weight of 500 feet of steel wire rope up an incline of 60° at a speed of 300 feet per minute. The motor will run at practically a constant speed, the power and speed of hoisting being varied, as well as the direction of travel of drums by the brakes, clutches, and gear. Thus the working is said to be simple and reliable. There are no complicated controlling and reversing resistances, and the hoist can be managed with safety by an unskilled operator. For starting the motor the "C. & C." standard starting box is used. It comprises, besides a double-pole switch and safety fuse, a graduated shunt resistance with 10 steps, and an automatic "overload" and "no load" release. Through this apparatus, if the current to the motor is interrupted, the starting handle will return quickly and automatically to the "off" position, and the motor can only be restarted in a proper manner through the "step-by-step" resistances, thus preventing any danger of injury to the motor by starting again with load on and motor at rest. The same action occurs with an overload, and thus a finely graduated fuse is unnecessary. The whole machine is compact, and massive in build, and is mounted on one solid bedplate. The weight of the whole is about 8,000 lbs. Owing to its entirely enclosed form, the motor is damp- and dust-proof. It is provided with self-feeding carbon brushes, requiring no change of lead under any variation of load, and needing the minimum of attention. The bearings are oiled by "ring lubrication," the oil reservoirs carrying an ample supply of oil, and are fitted with visible oil gauges and drain cocks all accessible from outside. By the removal of close-fitting hand-hole covers at both ends the armature is readily accessible. These hoists are made in standard sizes, from 5 to 50 brake horse-power, and are made on the "interchangeable" plan throughout.



Lists.—The Simplex Steel Conduit Company, Limited, of Coventry Street, Birmingham, have issued lists of their "ideal" system of wiring for electric light, power, bells, and telephones. The lists detail the various advantages claimed for the system, and give particulars of some installations carried out. The company has equipped works capable of a large output of steel conduit, together with all accessories in the way of T's, bends, and inspection pieces.

New Electrical Works.—It is stated that the old cotton mill on the Buxton Road, Bakewell, and land adjacent, have been purchased by Messrs. Drake & Gorham, electrical engineers. The necessary alterations are to be made to adapt the buildings to Messrs. Drake & Gorham's business. As a cotton mill the place gave employment to about 100 hands. There is ample water-power obtainable from the River Wye. The site is (or was up to the time of the purchase) the property of the Duke of Devonshire.

Patent Litigation.—The Comptroller gave his decision on 17th inst. in the matter of the Electrolytic Plating Apparatus Company's (Walsall) opposition to the grant of letters patent upon G. H. Nash's (W. Canning & Co., Limited, Birmingham) patent application No. 14,708 of 1897, for "An improved apparatus for the electro-plating of small articles." Messrs. W. P. Thompson & Co., of Birmingham, appeared for the opponents at the hearing, and Mr. A. J. Walter (instructed by Bedfern & Co., London) appeared for the applicant. The grant of letters patent was opposed on the grounds that the applicant (Nash) had obtained the invention from the Electrolytic Plating Apparatus Company, Limited, and that the invention had been patented in this country on an application of prior date, viz, by British patent No. 5,274, of 1896, vested in the Electrolytic Company. The Comptroller by his decision ordered Nash to insert a disclaiming clause in his complete specification, and also to strike out a certain portion of the existing letterpress thereof; subject to this being done he would seal him a patent.

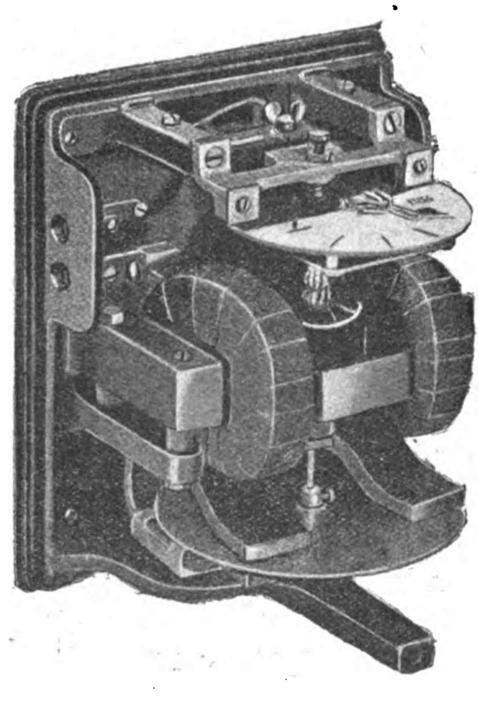
Personal.—Mr. John Hunter, late electrician to the Allan Line Shipping Company, Liverpool, has been appointed manager of the Liverpool Electric Lighting and Fittings Corporation, Limited.

Private Installations.—Messrs. Archer, New & Co., of Liverpool, have carried out a number of installations connected with the Liverpool, Birkenhead, and Southport Corporation mains, under the supervision of Mr. F. W. Rayner, late Liverpool manager of Messrs. New & Mayne. They have also put down a complete installation for the cotton warehouse of the Liverpool Warehousing Company, Limited, a 30-ampere Parker dynamo being run from a hoisting engine. The buildings are wired on the wrought-iron conduit system. A 30-ampere dynamo and Crossley oil engine has also been installed at Aigburth for Mr. Hollbrook Gaskell. They have fitted up Leasowe Castle Hotel and Hydro, Cheshire, for 500 lights, and six enclosed arc lamps in the grounds. An Edison and Swan dynamo, 200 amperes, and engine room switchboards, 60 E.P.S. K 21 accumulators, British Insulated Wire Company's underground paper insulation mains, and a Robey horizontal engine and Lancashire boiler, make up the installation. The Prince of Wales Hotel, Southport, has been fitted with 390 lights to be supplied from the Corporation mains; also 130 electric bell communications. Messrs. New's business is to be absorbed shortly by Messrs. New & Byrd, Limited.

Submarine Miners and the Electric Light.—The *Western Mail* says that a party consisting of two officers and 10 men of the Severn Division Royal Engineers (Volunteer Submarine Miners), whose headquarters are at Cardiff, are at present undergoing a month's course of instruction at Plymouth in electric lighting. The course consists of a series of lectures on the theory of magnetism and electricity, and the construction of the various kinds of dynamos and lamps used in the service for electric lighting. The practical work consists of instruction in the running of steam and oil engines, the working of dynamos, and the manipulation of "fixed beam" and "search" lights. The practical work takes place by day and night in connection with the forts, &c, at the entrance to Plymouth Sound.

Veritys, Limited, v. Sharp.—On Friday, in the Queen's Bench Division, before Mr. Justice Day, sitting for the trial of non-jury causes, the case of Veritys, Limited, *v.* Sharp came on for hearing. This was an action brought by Messrs. Veritys, Limited, who are electric lighting engineers, of King Street, against the defendant, who is an electric lighting engineer, to recover £90 8s. 8d. in respect of electric light fittings sold and delivered to the defendant for an installation at 56, Ludgate Hill. Mr. W. W. Thompson was counsel for the plaintiff, but the defendant did not appear, nor was he professionally represented.—Mr. Lionel George Conter, traveller for the plaintiff company, deposed to receiving the order from the defendant, in response to which the goods were delivered to him at Ludgate Hill. Mr. Sharp acknowledged the receipt of the goods. The plaintiffs had frequently applied for payment of the account, but it had not been paid.—His Lordship gave judgment for the amount claimed, with costs.

Wattmeters for Storage Batteries.—The increasing application of storage batteries to electric light and railway station use, as well as to street cars, motor carriages, electric launches, &c., where a portable source of power is requisite, has led the General Electric Company, of Schenectady, to develop a special type of meter, which will show at a glance the amount of energy available in the battery. The Thomson recording storage battery meter, as described in the *Street Railway Journal*, resembles in general appearance the standard Thomson recording wattmeter, and is, in fact, a development from it, the mechanism being almost exactly similar. The accuracy and durability characteristic of the standard type have both been maintained, while additional precaution is provided against injury from shock or vibration. The meter is provided with a single indicating needle moving over a horizontal semi-circular dial. The essential requirement for a storage battery meter is that the armature shall rotate in either direction and give equally accurate readings in both. In this meter this requisite is obtained. The reading of the meter represents not the amount of energy put into the battery, but the amount available, and when the needle points to zero on the dial, it shows that the battery is completely discharged. For motor carriage, street car, and electric launch service a meter of this character is a most necessary adjunct. Without it the operator is absolutely ignorant of the power upon which he can depend, and would run serious risk of finding himself at a standstill far from home with no means of getting either forward or backward



without recourse to some mechanical method. These meters are manufactured with any desired percentage difference between charging and discharging rates, and in all of the standard sizes in which two-wire Thomson recording wattmeters are built. Since, however, this percentage varies in almost every case, the General Electric Company manufactures them only to order. One size, that reading to 50 amperes, however, may be considered as standard, and will be more promptly furnished than any other.

Wireless Telegraphy.—Some experiments were made from the Terrace of the House of Commons on the morning of the 20th inst. The apparatus was fixed in a private smoke room just off the Terrace and in the treasurer's office of St. Thomas's Hospital, on the other side of the Thames.

ELECTRIC LIGHTING NOTES.

Barmouth.—Mr. T. Blackburn, C.E., and Mr. David Davies have each prepared a dust destructor and electric lighting scheme for the town. The District Council has appointed the Lighting Committee to consider both proposals and report.

Belfast.—Last week the electrical engineer was instructed to communicate with the contractors for new engines, requesting them to have the engines forwarded at once, the tests already made being of a satisfactory nature.

Blackpool.—Mr. Quin, the Blackpool borough electrical engineer, has just issued his report for the year ending March 31st last. The total revenue was £12,827, which included public and private lighting. The expenditure on working account was £7,152, and £3,856 was set aside for interest and sinking fund, being at the rate of 5¾ per cent. for these items. This leaves the sum of £1,819 as the net actual profit on the year's working. As the profit last year was only £828, there is a substantial increase. The units sold have gone up from 429,669 to 707,965, but the "generation costs" have gone down from 2·61d. per unit to 1·87d., a highly creditable result. The "general costs," too, have gone down from 64d. per unit to ·39d. The "total costs" of working per unit have gone down from 3·41d. to 2·42d. Mr. Quin deserves every credit for these reductions in costs of working. The total revenue has gone down from 5·5d. to 5·13d. per unit.

Cardiff.—The Electric Lighting Committee last week instructed the engineer to report on the question of the electric lighting of Newport Road.

Chelmsford.—The Board of Trade have confirmed the provisional order promoted by the Chelmsford Electric Lighting Company for the extension of their mains into the districts surrounding the borough, and have specified Springfield as a compulsory area.

Chester.—The Council last week authorised the Lighting Committee to have an electric main for street and private lighting, and for supplying motive power to compress air for the ejectors at the Infectious Diseases Hospital, Sealand, laid at an estimated cost of £1,100, of which £460 is to be charged to cost of the Infectious Diseases Hospital; to carry the new main to be laid along Brook Street, past the station, and connect it with the main in City Road, at the estimated cost of £55; to have a small addition made to the switchboard at the electric light station, at the estimated cost of £36, and to accept the tender of Messrs. Johnson & Phillips to supply 11 arc lamps for the Lower Bridge Street and Castle Esplanade extensions, for £136 11s.

Chiswick.—The District Council had a discussion last week regarding the "alleged scandal" in respect to the electric lighting order, and ultimately a Committee was appointed to interview Messrs. Bourne & Grant on the matter.

Conway.—At a meeting of the Conway and Colwyn Bay Water Board last Friday, a member expressed the opinion that the Board had valuable water rights which could be utilised for electric lighting purposes, and he moved that a committee visit the place and inquire into the matter. It was also proposed that a professional man be engaged to advise the Board. The Mayor was of opinion that the Board should carry a scheme through, or a company would soon be formed for the purpose. Mr. T. T. Marks, C.E., was appointed to advise the committee.

Coventry.—The statement of the Electric Light Committee shows the progress of the undertaking as follows:—Electricity supplied during quarter ending December 31st, 1897, 34,895 units; 1896, 25,685 units. Rentals for quarter, 1897, £830 8s. 9d.; 1896, £618 5s. 6d. Number of consumers on December 31st, 1897, 100; 1896, 72. Mileage of mains on December 31st, 1897—high tension, 2 miles 687 yards; low tension, 2 miles 1,331 yards; 1896, high tension, 2 miles 77 yards; low tension, 2 miles 332 yards. Electricity supplied during quarter ending March 31st, 1898, 35,090 units; 1897, 21,516 units. Rentals for quarter, 1898, £891 4s. 5d.; 1897, £547 6s. 5d. Number of consumers on March 31st, 1898, 112; 1897, 76. Mileage of mains on March 31st, 1898—high tension, 2 miles 1,592 yards; low tension, 3 miles 791 yards; 1897, high tension, 2 miles 337 yards; low tension, 2 miles 432 yards.

Darfield.—The Council will oppose the scheme of the Electric Lighting Syndicate so far as it may concern the Darfield district.

Dewsbury.—The Corporation are extending their system of street electric lighting, and already eight additional lamps have been erected. The improvement which has thus been effected has met with general approbation, and already many desires have been expressed in favour of a further extension. Householders and shopkeepers are asking for the extension of the mains to the outlying portions of the borough.

Doncaster.—The District Council will oppose the General Power Distributing Company's scheme for electric lighting in the district.

Dunoon.—The Police Commission has resolved, on the recommendation of the Pier and Parks Committee, to use the balance of current from the Castle dynamo for lighting the pier electrically. The offer of Messrs. Dixon to erect wires and lamps at £15 odd has been accepted.

East Stonehouse.—The Bill confirming the East Stonehouse provisional order was certified for second reading last week.

Greenock.—At a recent Police Board meeting the minutes contained a report of the conference with the Board of Trade on the subject of supplying electricity in the burgh. The Provost said it was absolutely necessary, if they should retain their provisional order, that steps be taken towards the installation of electricity within a year. They were clearly led to understand that the opposing company would in a year hence be in a much more favourable position if the Council showed they were not in earnest in the resolution passed to proceed with the installation. They felt very much indebted to the authorities of Port Glasgow and Gourock for the assistance which they gave them, and they made it clear to the Board of Trade that they would prefer to have the electricity supplied by Greenock rather than by a private company. Mr. John Cameron said the Board of Trade were surprised that in a large commercial town like Greenock electricity had not already been established, and when the argument was pressed upon them that the Corporation were the owners of the gas works, and that they must take great care of them, they were met by the retort that the universal experience of the Board of Trade was that wherever electricity was introduced it did not prejudicially affect the Gas Trust, but, on the contrary, both lights seemed to develop and pay corporations. There was no reason why they should have fresh taxation placed on the ratepayers, but if Greenock was to take its place along with other large towns, the time had arrived for the installation being formed. The matter was remitted to the Sub-Committee on Electricity to report their views on the best method of carrying out the details of the proposed installation.

Hertford.—The Corporation is inviting offers for a lease of its electric lighting order from persons competent to carry out same. See our "Official Notices" this week for particulars.

High Wycombe.—The Town Council had before it last week a report by the Electric Light Committee on general matters regarding the undertaking of the Electric Light Company. The Committee is to draw up a plan of proposed positions of public lamps.

Huddersfield.—The Hill Top Co-operative Society, Paddock, Huddersfield, have resolved to obtain estimates for the lighting of the premises by electricity. The Board of Trade has given formal permission to the Huddersfield Corporation to alter the standard pressure upon the low tension electric lighting mains in the central portion of the town from 100 to 200 volts.

Ilfracombe.—The Ilfracombe Electric Lighting Bill has passed through Committee of the House of Commons.

Kingswinford.—The Board of Trade has issued a provisional order to the District Council. The Bill has yet to be confirmed by Parliament.

Leeds.—The Local Government Board has intimated that the provisional order enabling the Corporation to issue stock, irredeemable or otherwise, for the purchase of the undertaking of the Yorkshire House-to-House Electricity Company had been made, and would shortly be submitted to Parliament for confirmation.

Lymington.—Messrs. Edmundson's Electricity Corporation have placed a proposal before the Town Council regarding electric lighting. They propose applying for a provisional order, and, with the consent of the Council, are ready to start work at once. The public lighting would be done at 4d. per unit, and private lighting at 7d. A special committee has been going into the matter, and was to report to the Council this week.

Lynn.—The whole Council in committee recommended this week that the offer of Prof. Robinson to prepare drawings, specifications, &c., and supervise the electric lighting installation, should be accepted. They also recommended that another site besides that near the walks should be selected for the central station works. The proposals were adopted.

Maidstone.—The Electric Lighting Committee has further considered the question of a combined dust destructor and electric lighting station, and is anxious for more information before reporting definitely to the Council. A small Sub-committee has been therefore appointed to visit Norwich and Leyton with a view of inspecting the works at those places.

Margam.—The Electric Lighting Bill has been certified for second reading.

Melbourne.—The Lighting Committee of the City Council recommends the purchase of the undertakings of the electric lighting companies. The Electric Light and Power Act provides that each company shall receive 10 per cent. beyond the total value of its undertaking. The assets of the two companies are roughly estimated at £150,000.

Metropolitan Asylums Board.—At the fortnightly meeting on Saturday, a letter was read from the Local Government Board asking for information as to the grounds which have led the managers to decide to substitute electric light for gas at the Northern Hospital at an estimated cost of £10,350. The Board also asked for a description showing the extent of the scheme. It was resolved to refer the letter to the Works Committee for consideration.

Newport.—The Electricity Committee on Tuesday morning decided to recommend the Corporation to sanction the purchase of emergency plant, in order to meet the demand for light which will have to be faced in the autumn. The present plant is already overloaded, and as the demand shows a steady increase, the works will be inadequate to supply light for next season even for the present area. The Chairman (Alderman Moses) and the consulting engineer (Mr. R. Hammond) have made inquiries and inspected plant, and the Committee have adopted their suggestion that to meet the emergency second-hand Brush plant, which can be obtained for £1,150, after being put in thorough repair, shall be purchased. As the new plant cannot be delivered in time to meet the necessity, it is necessary to obtain some additional plant, and in the opinion of the Committee this is the best that can be done.

North Berwick.—Prof. Kennedy recently wrote to the Town Council regretting that he would be unable, owing to pressure of business, to give time for a report on electric lighting at present, and recommending the firm of Messrs. Burstall & Monkhouse, Westminster. After discussion it was agreed to ask Messrs. Burstall and Monkhouse to report.

Nottingham.—A reduction is to be made in the charges for electrical energy from June 30th. The Corporation will in future charge for lighting purposes for any quantity not exceeding the equivalent of 100 hours per quarter 4d. per unit, and 2d. afterwards. For power purposes it will be 2d. per unit for four hours' average daily use, and 1d. beyond.

Ossett.—The new mill premises of Mr. R. E. Phillips, mungo manufacturer and rag merchant, at Gedham, have been lighted electrically. The plant comprises a Robey 30-H.P. nominal horizontal engine, and a multipolar dynamo, capable of supplying current for about 200 16-C.P. lamps, and a 12-H.P. electric motor. At present just over 100 lamps are installed. The lights are arranged in groups of eight, and all circuits controlled by single-pole switches. The premises have been fitted up with telephones on the "Ennunciator" plug-board system. The work has been carried out by Mr. Walter Robb, of Ossett.

Paris and Berlin.—Some recently published statistics show that in Berlin there are some 300,000 16-C.P. incandescent lamps installed, besides several thousand arc lamps. The length of mains is about 186 miles, and the power developed is about 28,000 H.P. There are also some 1,600 motors, taking 6,450 H.P. The price for lighting is 7·5d. per kilowatt-hour, for power 2d. per kilowatt-hour. Paris demands some 25,000 H.P. for about 418,000 lamps of 10 candles, and 7,448 arc lamps, with about 240 miles of mains. The motors number 513, requiring 1,940 H.P., and the price is 11½d. per kilowatt-hour.

Peterborough.—The Peterborough Electric Light and Power Company is prepared, if the Council does not commence to put its electric lighting order into effect by June, to make application for the order to be revoked. As, however, Mr. Gill, the engineer, has prepared plans for the proposed electricity works in Queen Street, the site having been already purchased by the Corporation, the company's application will probably be unnecessary.

Petersfield.—For some time past the Petersfield Urban District Council (Hants) have had under discussion the advisability of applying for a provisional electric lighting order. At the last Council meeting on the 19th inst. it was decided to communicate with different firms of electrical engineers to ascertain the terms for advice and report as to the practicability of an electric lighting system for the town.

The District Council has referred a proposal that it should apply for an electric lighting provisional order to the Lighting Committee.

Plymouth.—The work of laying the electric cables is going on in the principal thoroughfares.

Portsmouth.—It is stated that a scheme has now been prepared for introducing incandescent electric lighting into rather more than 100 streets in which gas is now the sole illuminant. The idea is to utilise the present gas standards, to the top of which two incandescent lamps would be affixed. It is estimated that the cables could be laid, the lamps converted and the lights supplied on precisely the same terms as is now charged for gas. It is further understood that the balance-sheet of the Electric Light Committee, which will shortly be issued, is likely to be more satisfactory than expected. Owing to the engineering strike last year, the new works were delayed for seven months, and the Committee were put to great expense in hiring machinery to keep the station in full operation. The surplus over all liabilities will not reach £1,000.

Salford.—At last week's Council meeting, Mr. A. Haworth, chairman of the Electric Light Committee, moved the adoption of plans for the erection of a new generating station on land in Strawberry Road, at an estimated cost of £28,161. He said they were considering plans for the application of electric traction to the tramways, and as they had already gone as far as they dared in supplying the current to consumers, they had to decide between extending the old station and erecting a new one. He believed that, unless perhaps for the first year, the proposed new station would not entail any charge on the rates, for as soon as they commenced working, interest and sinking fund would be provided out of the revenue. The electricity works were making gratifying progress, and the loss during the past year had been reduced by £900. The motion was seconded by Mr. Boys and adopted.

Sheffield.—The residents have this week been voting on the electric lighting question. The papers were collected on Monday. The voting was as follows:—For Corporation purchase, 28,130 votes; against ditto, 1,965 votes; majority, 26,165 in favour.

In accordance with the resolution of the City Council, an expert inspection of the water reservoirs was commenced on 23rd inst. by Mr. Frederick Nell, of London, with a view to advising the Council upon the question of utilising the water-power available for generating electricity.

Southampton.—The Court of Arbitration appointed to decide what compensation shall be paid by the Corporation to the Southampton Tramways Company for their undertaking, held its first sitting on 14th inst. to fix the course of procedure. Sir Henry Oakley sat as umpire, Messrs. G. Hopkins, C.E., and J. Kincaid, C.E., as arbitrators, and Mr. W. Phipson Beale, Q.C., as legal assessor.

Stockport.—The Gas and Electric Lighting Committee received 54 applications for the post of clerk of works for the electricity undertaking. They are being considered, and will be dealt with this week.

Stonehouse.—The District Council has disapproved of plans submitted by a company for the erection of an electric lighting station at the corner of Phœnix Street.

St. Pancras.—Mr. H. J. Menzies, chairman of the Electricity and Public Lighting Committee during the past year, was elected chairman of the Vestry at the first meeting after the election on Wednesday evening. It was decided, on the recommendation of the Electricity Committee, to sanction the expenditure of £414 for the installation of a coal conveyer at the King's Road station, in order to deal with the increasing output. The resignation of Mr. J. C. A. Ward, inspector of works, who has obtained an appointment under the Corporation of Glasgow, was accepted, and it was resolved to give him a testimonial under the seal of the Vestry.

Tynemouth.—The Tynemouth Aquarium is being fitted up by its new proprietor with a complete electric light and power installation, including engines, dynamos, motors, and boilers. The work has been placed in the hands of Messrs. W. Dalzell & Co., electrical engineers, of Newcastle. The Aquarium will be lighted by 14 arc lamps, each of 2,000 C.P., besides numerous smaller lamps.

Winchester.—The directors of the Winchester Electric Light Company announce that a supply of current is now available. They are prepared to fit up any premises on the free wiring principle. No charge is to be made for any current used prior to July 1st.

A committee recommends the Council to accept the tender of the Gas Company for lighting the streets of the city for a further period of three years. This company's offer amounts to £1,240 per annum, while that of the Electric Lighting Company is £1,313.

ELECTRIC TRACTION AND MOTIVE POWER NOTES.

Blackpool.—The report has been issued of the electric tramway for the year ending March 31st, 1898. The estimated receipts for the year were £14,575; they actually were £15,496—an increase of £921. The estimated expenditure was £9,776, and the actual £10,206, increase £360. This increase includes £119 as the tramway share of the expenses of the Continental deputation. The gross profit is £5,290. Deduct from this £2,984 as interest and sinking fund, and there is a net profit of £2,306 Deduct again 1 per cent. for depreciation on a capital of £58,900, which is £589, and we get £1,717 as the available balance of profit for the year, a sum equal to 1½d. in the £ on the rates. 2,279,209 passengers were carried—an enormous increase on the previous year. The growth of the tramway receipts is as follows:—1895-6, £9,869; 1896-7, £13,223; 1897-8, £15,496. In the last report, for 1896-7, although the receipts had grown by £3,500, the profits fell off by £360. This year they have jumped up from £230 to £1,717. The car miles run for the year ending March 31st of the present year were 220,818. The receipts per car mile were 16·9d., and the expenses 11·1d., giving a profit of 5·8d. per car mile. The trams cost for electrical energy, coal, water, &c., £2,172; wages, £3,120; channel repairs, which were kept down in view of the overhead system being adopted, £658; repairs to motors and gearing, £2,145, and to cars and wheels, £675.

Brighton. — At last week's Council meeting the Works Committee's report was adopted, in which it was recommended that 2,100 feet of the electric railway lying between the Camelford Street groyne and the east end enclosures should be carried on piles on the seaward side of the new breastwork. The estimated cost to Mr. Volk is £1,500 additional. This was agreed to, and it was also resolved that the Corporation should grant Mr. Volk a lease for the period of 21 years of the arch now in his occupation, and a license for the same period for the railway, at a rent for the whole of £120 per annum. The license to be subject to conditions providing for its determination in the event of its being judicially decided that the railway is a nuisance, annoyance, injury, or danger to the public. Mr. Volk was to maintain the railway, which, at the expiration of the 21 years' lease and license would become the property of the Corporation. A table showed the compensation to be paid to Mr. Volk in the event of the Corporation at any time taking possession of the railway at six months' notice. The scale ranged from £3,000 in the first year, to £200 in the 21st year. The terms also prescribed that the maximum fare should be 2d. for the single journey, and 3d. for the double journey.

Bristol.—A requisition on behalf of the Corporation of Bristol for leave to withdraw their opposition to the Bristol Tramways (Electrical Power, &c., Bill) has been deposited in the Private Bill Office of the House of Commons.

Cardiff and Penarth.—A deputation from the Penarth Chamber of Trade will support the Cardiff and Penarth light railway scheme at the Board of Trade inquiry on June 1st.

Clacton-on-Sea.—The Coast Development Company has been formed with a capital of £500,000 for various purposes, one of which is to enlarge the pier at Clacton-on-Sea, and to construct an electric tramway. The company proposes to also put down an electric line at Walton-on-the-Naze.

Dundee-Broughty Ferry.—Mr. R. O. Ritchie, of Messrs. Greenwood & Batley, electrical engineers of Leeds, who are the promoters of the electric light railway scheme to connect Dundee and Broughty Ferry, paid a further visit to Dundee last week. The *Dundee Courier* interviewed him and he made some general comments regarding the scheme.

Dublin.—Rapid progress is being made with the electric tramway lines in the city, and it is expected that in about four weeks the connection between O'Connell Street and Haddington Road will be completed. The trip can then be made direct from Nelson's Pillar to Dalkey without changing the car.

East London (South Africa).—The East London Town Council have prepared specifications for tramlines and electric light, and, we understand from a contemporary, that tenders are being called for in England and in the colony.

Gillingham.—At the meeting of the Gillingham Urban District Council on the 19th ult, the clerk read a letter from Messrs. Ashurst, Morris, Crisp & Co., to the effect that the promoters of the electric trams were prepared to proceed with the remainder of their scheme for running trams throughout the Gillingham district, and with reference to the proposed improvements in the High Street, they were prepared to contribute £2,000 towards the cost. The question of providing weekly tickets for workmen at a cost of 9d. for 24 journeys was also discussed, and the promoters propose to provide two special trams on each route for the workmen at stated hours during the day. The Civic Union sent a copy of a resolution passed at their last meeting, calling upon the Council to oppose the scheme, and take the necessary steps for laying down electric trams of their own. Several members of the Council were in favour of the promoters carrying out their scheme in its entirety for the whole of Gillingham. There was a great deal of discussion on the subject, and the whole matter was eventually referred to a sub-committee. The adjourned public inquiry into the scheme will take place on June 4th, and there is very little doubt that although strong opposition will prevent the electric trams being adopted throughout the whole of the combined districts of Rochester, Chatham, and the neighbourhood, still the trams will appear at Gillingham, and most likely through Old Brompton, and from a part of Chatham to Luton.

Glasgow.—The laying of plant for the introduction of electric cars upon the Springburn route proceeds fairly satisfactorily but, adds a local paper, not quite so quickly as some anticipated The Tramways Committee is stated to have hopes of opening the route from Mitchell Street under the trolley system by the Fair holidays. The lines, which have been relaid, are now pretty nearly completed. The poles, which were commenced to be erected at the Springburn end, are gradually planted citywards. The engines and dynamos are now complete at the works, and some of them are being delivered. The carriages are being constructed at the Corporation's own workshops, and are well forward. One of the large sheds at Springburn is being altered and made suitable for the power house. Good progress is being made with the lowering of the road under the railway arch at St. Rollox.

Hastings.—Mr. Murphy appeared before the Town Council on 19th inst. and explained his proposed light electric railway scheme for Hastings. He would put down a line of 3 feet 6 inches gauge, with 18 cars, and his company would agree to a 25 years' lease. The Corporation could use the overhead wire standards for the purpose of electric lighting. Mr. Murphy's interview lasted some considerable time, and numerous questions were put and answered. In a subsequent discussion the Council went into various points in connection with the matter, and ultimately passed a resolution supporting the Hastings, Bexhill, and district light railways (electric) scheme, which is Mr. Murphy's proposal. A committee is to go into the matter of terms with the promoters and report on June 3rd.

Huddersfield.—The County Borough Council has instructed the Tramways Manager and Borough Electrical Engineer to prepare and submit a report as to the application of electric traction on one or more of the sections of the present steam tramway system, having regard to capital expenditure and the present rolling stock.

Hull.—The ceremony of laying the first rail of the electric tramways is expected to take place on June 9th. The city engineer has reported on the subject of the overhead construction. A question had arisen, he said, whether the poles for carrying the trolley wires on the Holderness Road route should be placed on the north or the south side of the road. It was being arranged to place the poles on the right-hand side going out of the town on the Hessle Road, Anlaby Road, Spring Bank, and Beverley Road routes, and also on the right-hand side coming from Nelson Street on the Old Town route If it were not for the fact that through cars might be run from either the Hessle or Anlaby Road on to the Holderness Road (if Savile Street is carried straight through to St. John Street) the right-hand side going out of the town would no doubt be selected for the Holderness Road route; but in view of the possibility of through cars being run, he (the engineer) thought it desirable to adopt the left-hand, or north side, for the route. The only disadvantage which could arise by fixing the poles on the north side of the route appeared to be that unless the lines were arranged so that the cars would run straight through, by connecting St. John Street to Savile Street, or otherwise, a car could not, in case of emergency, be transferred to or from the Holderness Road route without turning it round; but if a double junction were provided at some suitable point on the system, the cars could be turned round if the necessity for doing so arose. It was resolved to adopt the engineer's suggestion with respect to the poles in Witham.

The Tramway Deputation Sub-Committee has been authorised to advertise for tenders for electric cars to run with those already ordered.

Italy.—It is reported that the Rete Adriatica Railway Authorities are considering the question of introducing electric traction on the railways between Lecco and Sondrio (79 kilometres) and between Colico and Chiavenna (26 kilometres). The water power of the River Adda would be utilised in generating the necessary electrical energy.

Kidderminster-Stourport. — This electric tramway scheme which was described in our last issue, was passed by the Board of Trade inspector on Wednesday, 18th inst. Sir F. Marindin and Major Cardew were the officials who inspected the line. In the matter of speed it was considered that 8 miles an hour would not be too great a pace in the streets, except Foundry Street, Stourport, and at certain narrow parts in Kidderminster, where 5 miles must be the maximum. On the open road between Kidderminster and Stourport a rate of 12 miles would be allowed. The inspectors were met by District Councillors, Mr. A. Dickinson, and representatives of the contractors. Sir Francis gave permission to commence running at once. He made suggestions with reference to the stopping places, but the permanent way and power plant were perfectly satisfactory.

Liverpool.—Notwithstanding that the Council at its last meeting declined to pass the recommendation of the Tramways Committee to accept the tender of Messrs. Willans & Robinson, to supply two compound engines and dynamos at the price of £6,530 each, and a triple expansion engine and dynamo at the price of £6,939, we learn from the *Liverpool Daily Post* that the committee at a special meeting on the 13th again passed the recommendation, which will, therefore, again come before the Council in its original form. An amendment was moved by Mr. Rutherford, and seconded by Mr. Beaver, "That in view of the fact that no engine of the type recommended has hitherto been used for power, this committee consult Dr. Hopkinson thereon prior to issuing the order." This was rejected by a large majority.

Llandudno.—At last week's Council meeting various small main extensions were authorised. The question of the application of the Llandudno and Colwyn Light Railway Syndicate, and the letters of the Simplex Company and Messrs. Kingsland and Edwards was discussed in a report by Mr. A. H. Preece. Mr. Preece said that it was to be regretted that the establishment of tramways in Llandudno could not be undertaken by the Council. However, as it had been necessary to arrange matters with the Light Railway Syndicate, the Council were only safeguarding their own interests by insisting upon the supply of energy remaining in their own hands. The question of the powers of the Council to supply the syndicate with energy in these outlying districts was a legal matter which he was unable to enter into. At the same time he saw no reason why it could not be suitably arranged temporarily with the chief parties concerned if a permanent arrangement were not possible. As regards the terms in the agreement for the supply of electrical energy, the following heads were suggested:—(1) The syndicate should guarantee the use of a minimum quantity of energy per annum. (2) The Council should agree to deliver the requisite electric current at constant pressure to a switchboard in the generating works, and all work, consisting of feeders, &c., beyond this board should be erected by the syndicate. (3) The syndicate to fix the maximum quantity required at any moment, and any increase to be subject to not less than nine months' notice. (4) The Council should agree to penalties in case of failure to supply energy, and fix fall in pressure below a fixed point, subject to causes beyond the Council's control. (5) The price to be mutually agreed upon subject to modification at the end of the second season, and every three years after. (6) The energy supplied to be measured by approved meters, and any difference to be settled by arbitration. (7) Payments to be made every month. The question of the prices to be charged was the only point which may present difficulties in settlement. He suggested that the Council should consider a scheme by which the payment should depend upon the interest, sinking fund, and depreciation of the cost of the extra plant required, and upon the actual working cost of the power generated. He anticipated that the extra capital expenditure in the generating works would not exceed £5,000. In reference to the overhead and underground system, Mr. Preece reported to the effect that there are four principal systems, viz., the overhead trolley system, the underground slot system, the closed conduit system, and the accumulator system. The overhead system was undoubtedly the cheapest system to instal and to maintain. The rest were all expensive both in first cost and in maintenance. The only possible objection to the overhead system was the æsthetic one. There was not the least doubt that a properly designed overhead system, with handsome poles erected in the centre of the main road upon which the public lamps could be placed, might be made sufficiently attractive to overcome the objection raised to the system. The Council adopted the recommendations.

Lord Jersey and Colonel Boughey held a light railway inquiry at Colwyn Bay on Friday last. The scheme was supported by Llandudno and Colwyn Bay District Council and the Conway Corporation, while Lord Mostyn and other private parties opposed. After two hours' evidence the promoters approached Lord Mostyn, and he withdrew his opposition upon terms. The Commissioners will recommend the scheme.

London.—Arrangements are being pushed forward with a view to providing the northern suburbs of London with increased facilities for getting cheaply and quickly into the central district. The scheme, says the *City Press*, is being prepared by the Metropolitan Tramways and Omnibus Company, and, if the authorities allow the programme to be carried out in its entirety, something like 30 miles of rails will be laid, at a cost of about £500,000. The new scheme is styled the "London, Barnet, Edgware, and Enfield Light Railways," and by means of electricity, on the overhead system, it intends to provide cheap and quick transit for passengers and parcels. A great part of the district affected is at present only served by the Great Eastern and Great Northern Railways, and the proposal has been warmly received in the localities that will be benefited. Owing to the fact that the London County Council are committed to a policy of developing the tramway system in their own borders, the new railways will have to commence at various points outside the county boundary. These will not be isolated points, but in most cases will practically be junctions with the main routes of the North Metropolitan Tramways Company. For instance, the latter runs cars to Wood Green, and from this point the new company will continue along the high road to Enfield, *viâ* New Southgate, Palmer's Green, Winchmore Hill, and Bush Hill. From Enfield a branch to the right will connect with Ponder's End, to which the North Metropolitan Company already convey passengers. From the base at Wood Green, also, a connection with Tottenham will be made, joining on to the existing tramway to Ponder's End. A third line from Wood Green will run *viâ* Friern Barnet and Whetstone to Chipping Barnet. From Whetstone it will be possible to get south-east through East Finchley and North End to Highgate; and south-west to Hampstead, Child's Hill, and Cricklewood; Finchley and Church End being served *en route*. Cricklewood is to be the centre of a connection between the Marble Arch and Edgware, the first part of the journey being in omnibuses run by the new company as feeders to the western branch of their system.

London United Tramways Bill. — The adjourned report of the Highways Committee of the London County Council in reference to the London United Tramways Bill, was again brought forward at last week's Council meeting. It will be remembered that the committee suggested that the Council should support its petition against the Bill by evidence before the Select Committee. Earl Russell had given notice of an amendment that the Council should offer no opposition to the use of overhead traction in the Uxbridge Road, but this was not proceeded with owing to the withdrawal of the recommendation by the chairman of the committee. Mr. J. W. Benn (chairman of the committee) asked permission of the Council to withdraw the paragraph, the committee being of opinion that they would be touching upon the scope of the Select Committee. The latter, he remarked, were proceeding on the lines of testing that clause of the Bill, the object of which was to deprive the Council of its power of veto in regard to mechanical traction. The question would, however, come up again, and hence he desired to withdraw the recommendation. The Council then consented to the withdrawal of the paragraph.

Norwich.—The Norwich Electric Tramways Bill came last week before the Standing Orders Committee of the House of Commons, on the petition of the promoters to be allowed to insert an additional provision giving them power to widen streets for the purpose of the tramways. The committee allowed the additional provision to proceed.

When the electric tramway Bill came before the Parliamentary Committee on 23rd inst., there was a strong opposition against running the trams along Surrey Street, and, in consequence, this portion of the scheme was struck out.

Redditch.—The District Council has given assent to a proposal made by Messrs. Coleman & Whiteley, solicitors, on behalf of a syndicate to lay down a light electric railway from the railway station, Redditch, through the populous districts of Headless Cross and Crabbs Cross to Astwood Bank, a distance of three miles.

Richmond.—The Duke of Cambridge, Lord Charles Beresford, the Earl of Dysart, Lord Perth, and others are opposed to the Kew and Hampton Court electric tramway scheme.

Richmond and Hampton Court.—At a meeting of the Kingston-on-Thames Town Council on Tuesday last week, it was agreed to dissent from the proposals to construct a light railway for passengers through the borough boundaries in connection with the scheme to connect the West End with the district by trams worked on the trolley system. The General Purposes Committee having framed a resolution to this effect, Councillor Lynes said there was undoubted need for better communication, seeing that Kingston was fast approaching the dimensions of a county borough, but he thought that a system of tramways under their own control would not only be a source of revenue, but would utilise the day load from the Corporation's electric lighting station. Alderman J. B. Walker, J.P., said that if the present light railway scheme were carried through, the Corporation would not have the option to purchase the undertaking, as under the Tramways Acts. He thought the Corporation ought not to lose control of their roads under any circumstances, and that the proposed alteration of the level of the road beneath the railway bridge in Richmond Road would make that place even more dangerous than it was already. Councillor Horsfield pointed out that Kingston had made a great mistake 30 years ago in refusing to allow the L. & S. W. R. Company to bring their main line into the town. He thought that the matter should be fully discussed at a special meeting, and said that he had seen on the Continent that wherever such railways had been made, the country round about them was in a very flourishing state. The Mayor (Councillor W. Hart), in putting the committee's recommendation, said that in the cases cited by Councillor Horsfield, the lines were worked either by the State or the municipal authorities. The resolution was carried *nem. con.*

Rowley Regis.—The District Council had a brief discussion last week regarding the scheme of electric light railways brought forward by a company, and it was resolved to support the scheme. It was stated that the Dudley Corporation was promoting a tramway scheme which it would like to run through Rowley Regis. The District Council of the latter place, however, thinks the matter would be more satisfactory if in the hands of a company.

Spen Valley.—It is extremely probable that within the course of a very short time some important developments will be made in the Spen Valley of Yorkshire in regard to the use of electricity as a motive power. An agitation has been proceeding sometime for placing the towns of this populous district more in touch with each other by means of trams. The matter is not only being discussed by people living in the towns, but by gentlemen connected with tramways in other towns. A director of a Midland electric tramways company visited the district, and after inspecting the various routes suggested promised to report to his company. He also stated that he would come over again and bring the company's engineer with him. The managing director and engineer of the British Electric Traction Company has also visited the district several times recently. The latter company are also prepared to lay down the line if there is a prospect of a reasonable return for the outlay, and providing that there is no opposition from local authorities. The scheme is an extensive one and would be about 11 miles in length. It is proposed that the line should proceed by way of Halifax Road, Berkdale Road, Starncliffe Road, White Lee Road, and then through Heckmondwike to Liversedge, and forward to Cleckheaton. The line should then proceed to Gomersal and effect a junction with the existing tramway from Dewsbury on which, however, steam power is used. The existing tramway from Gomersal, it is thought, could be purchased, and, in fact, some of the gentlemen connected with the tramway company have been approached and were not disinclined to sell out. By this circular route the trams would pass through a district with a population of over 100,000. It is stated that the corporations and district councils far from opposing the running of trams through these districts would do all they could to encourage.

St. Petersburg.—The Helios Company has offered to introduce electric traction on the St. Petersburg tramway on the following conditions:—The three existing lines to be converted into two lines of 4 5 and 7 3 kilometres in length. The cars to be worked with accumulators, and also to be lighted, heated, and braked by electricity. The fares for each line to be five and three kopeks. A three minute service to be run during the day, and a five minute service in the evening up to 12 o'clock. If the city should wish to work the line itself, the Helios Company asks to construct the line and the cars and also to supply the electric energy. After taking over the installation, the city will be asked, over and above the payment for the energy, to pay to the company 7 per cent. per annum on the installation capital for 40 years. But in case the city should not take over the undertaking, the Helios Company offers to work the undertaking for 40 years and pay the city on the net income annually: first, 7 per cent. on the installation capital; second, 1 per cent. of the capital for maintenance and the reserve fund. After subtracting the said 8 per cent., 30 per cent. of the remainder of the net income falls to the Helios Company, while the remaining 70 per cent. goes to the city, a minimum sum of 200,000 roubles yearly being guaranteed. Should the proposal be accepted without delay, electric traction could be introduced about September 1st. Further proposals are being made to take over the much more extensive network of the second horse tramway company.

Teeside.—We understand that the Middlesbrough, Thornaby, and Stockton electric tramway, which has been put down by the Imperial Tramway Company is now completed, a trial trip over the whole course from Norton to North Ormesby and Linthorpe being made by local pressmen and the officials of the company on Monday last. The run was not a formal opening, but merely a trial to see that the gauge was true, the points properly adjusted, and everything satisfactory.

Worksop to Newark.—It is stated that the Railway Corporation of Great Britain (the promoters of the above scheme) have decided to defer their application to the Light Railway Commissioners for powers to construct this proposed electric line until next November.

TELEGRAPH AND TELEPHONE NOTES.

The Gotland Cable.—The cable steamer, *H. C. Ørsted*, which left Henley's Telegraph Works at North Woolwich on the 21st inst., with the Gotland cable on board, arrived at Copenhagen on the 24th inst. and proceeded at once to Ahr, from which point she will start laying the cable. This is the second Gotland cable made and laid by Messrs. Henley—the first, laid many years ago, being still in good condition.

Interruptions of Cables to the Cape.—Since March 4th, the date of the repair to the cable between Aden and Zanzibar, on the East Coast of Africa, the interruptions of the cables to the Cape have been almost entirely confined to those on the West Coast. The record is as follows:—

	Down.		Repaired.
St. Thomé-Loanda ...	March 17th	...	March 19th.
Sierra Leone-Accra ...	April 9th	...	April 19th.
Cape Town-Mossamedes	„ 14th	...	May 5th.
Benguela-Mossamedes ...	„ 20th	...	May 5th.
Kotonou-San Thomé ...	„ 27th	...	Still interrupted.
St. Thomé-Loanda ...	May 4th	...	May 14th.

Thus from March 17th up to the present time, with the exception of 20 days, the West Coast route to the Cape has been totally interrupted; two of the main cables being down together during a portion of this time, and three of the main cables being simultaneously unavailable during another portion of the period mentioned. It is fortunate that during this period the only cable interrupted on the East Coast was that which runs from Delagoa Bay to Port Natal, which was useless on two occasions, during which, however, communication with the Cape was not entirely cut off, as telegrams for Cape Colony could still pass over the Transvaal landlines. As public confidence in Mr. Kruger's administration seems to be reviving, the fact that all telegrams for Cape Colony have occasionally to pass over the Transvaal landlines need not arouse such anxiety as would have been natural during the recent misunderstanding at Johannesburg.

Pacific Cable.—The *Critic* says that the events of the Spanish-American war, more especially the cable-cutting tactics of the opposing forces, have impressed upon Canadians the value of an open cable communication in time of war, and renewed interest has been aroused in favour of the Pacific Cable scheme. The general opinion is that Canada should take the initiative in the movement, especially as she contributes so little to the defence of the Empire. It is, therefore, being advocated by prominent Canadians and Imperialists, among others Doctor Parkin, that a joint resolution from both Houses of the Canadian Parliament be addressed to the Home authorities, asking that a Royal Commission should be at once appointed, with full powers to arrange for the construction and operation of a cable from Canada to Australia. It is also proposed that the Commission should assign the fair proportion of cost to be borne by the different parts of the Empire, the initial cost to be guaranteed by Canada. As Sir Sandford Fleming has proven, to his own satisfaction at least, the enterprise would pay from the start, and it would at least be an exhibition of our national pluck and patriotism.

Shallow Water Cables.—On many occasions we have pointed out the risks which attend telegraph cables lying in shallow water, even when no organised attempt is made to destroy them. This opinion is quite warranted by experience, but in time of peace the attention of the public is not drawn to such occurrences, as their interests are not sensibly affected. The extent of the damage to which we refer may be gauged from the following extract from the abridged report of the Great Northern Telegraph Company:—"The state of the cables in Europe has not been satisfactory during 1897, especially towards the end of the year. No fewer than 11 of the cables have been interrupted, the total number of interruptions being 32. These have nearly all been due to injury caused by the fishing vessels, especially by the steam trawlers, which are spreading more and more, not only over the North Sea, but also in the Skager Rack and Kattegat. Even the strongest cables cannot withstand the rough treatment to which they are exposed, and we are, therefore, now considering the advisability of making an alteration in the type of cable so as better to protect them against the attacks of the trawlers." This experience goes to prove the ease with which shallow water cable can be interrupted, as along the track of these cables in the North Sea, the depth of water is generally less than 50 fathoms. It is clearly against the interest of the trawlers to fall foul of a strong telegraph cable, as by so doing they run the risk of losing their trawl nets and lines, otherwise the interruptions referred to would be much more frequent. The lesson to be gathered from this is of especial interest to us now when the vital importance of unimpaired telegraph lines is so clearly illustrated in the case of the war between America and Spain. With this lesson before us we would again strongly insist on the danger to which the cables connecting England with Gibraltar, Malta, West Africa, the Cape, Zanzibar, Mauritius, Egypt, India, the Straits Settlements, China, Australia, and New Zealand are exposed. If we except Continental landlines, and also an impracticable route *viâ* America, the West Indies, the South American Republics and Brazil, we are utterly and entirely dependent for communication with the colonies above-named, on a single group of three cables, which, starting from Cornwall, run southwards to landing places in Spain and Portugal, all lying for a distance of about 150 miles from England in water which is not 100 fathoms in depth. These cables lie within easy reach of the French naval headquarters at Brest, and however efficiently the mouth of the Channel might be patrolled by English war vessels, the risk of interruption, and the disastrous consequences which such interruptions would entail, are much too serious to be any longer regarded with levity.

Teneriffe-Cuba Cable.—A despatch dated April 4th, from H.M. Chargé d'Affaires at Madrid to our Foreign Office, says that the Minister of Colonies is authorised to announce a public auction for the concession for the construction and establishment of a submarine telegraph cable between Cadiz, Santa Cruz of Teneriffe, the Island of Vieques (near Puerto Rico) and Havana.

CONTRACTS OPEN AND CLOSED.

OPEN.

Belfast.—June 6th. The Harbour Commissioners are inviting tenders for the supply of three belt-driven, continuous current, series wound dynamos, to give 15 amperes, 2,850 volts, at 800 revolutions per minute, for 18 hours' continuous running without undue heating. Harbour engineer, Mr. G. F. L. Giles, from whom particulars may be obtained. See our "Official Notices" for particulars.

Belgium.—June 10th. The Provincial Government Authorities in Brussels are inviting tenders for an installation of electric lighting in the Bibliotheque Royale, in the Place du Musée, Brussels. Tenders to be sent to Le Gouvernement Provincial, Rue des Augustins, 17, Brussels, from whence particulars may be obtained on payment of 4s. 6d.

Belgium.—May 31st. The Municipal Authorities of Ixelles, a suburb of Brussels, are inviting tenders until May 31st for the exclusive concession for the supply of electrical energy for lighting and power purposes during a period of 26 years, that is, to September 1st, 1924. Tenders to be sent to the Secretariat de la Commune d'Ixelles, Brussels, from whence particulars may be obtained.

Bournemouth.—June 20th. The Corporation is inviting tenders for the supply, &c., of cables, arc lamps, incandescent lamps, wiring, switchboards, fittings, &c.; also steam dynamo, &c. Particulars from the borough engineer, Mr. F. W. Lacey, also see our "Official Notices" this week.

Bury St. Edmunds.—June 13th. The Corporation invites tenders for the supply and erection of Lancashire boilers, three 60-kw. steam dynamos, transformer and booster, accumulators, street mains, and various other machinery and apparatus for the electricity undertaking. Consulting engineer, Mr. F. H. Medhurst, 13, Victoria Street, S.W. See our "Official Notices" May 13th.

Coventry.—June 7th. The Electric Lighting Committee invites tenders for electric mains, switchboards, arc lamps, posts and apparatus in connection therewith. For particulars of the several sections see our "Official Notices" May 13th. Mr. Gilbert S. Ram, city electrical engineer.

Hammersmith.—June 8th. The Vestry is inviting tenders for the supply and erection of a Ledward evaporative condenser and tanks, air pump, circulating pumps, and pipe work. Consulting engineer, Mr. A. H. Preece. See our "Official Notices" May 27th for particulars.

London.—June 21st. The London County Council is inviting tenders for engines, dynamos, accumulators, switchboards, feeders, distributors, and service mains and all accessories, to be fixed complete in buildings at the Crossness Outfall Works, near Erith, Kent. The L.C.C. also requires tenders for providing and fixing cables, wires, conductors, casing, pendants, brackets, and other fittings, columns, lanterns, lamps, switches, and switchboards, distributing boards, fuses, cut-outs, &c., necessary for the lighting by electricity of the Crossness pumping station and works, near Erith, Kent. Particulars of both contracts from the Engineer's Department, County Hall, Spring Gardens, S.W. See also our "Official Notices" May 27th.

Spain.—May 28th. Tenders are being invited by the Municipal Authorities of Plencia (province of Viscaya) for the concession for the electric lighting of the public streets of the town. Tenders to be sent to El Secretario del Ayuntamiento de Plencia (Viscaya) from whom particulars can be obtained.

St. Mary, Newington.—June 6th. The Vestry Electric Light Committee is inviting tenders for the supply and erection of engines, generators, and public lighting plant for the electric lighting scheme. Engineers, Messrs. Kincaid, Waller & Manville.

Sunderland.—May 27th. The Corporation invites tenders for the supply of steam and other piping, and water softener for the electricity works. Borough electrical engineer, Mr. J. F. C. Snell. See our "Official Notices" May 13th for particulars.

Taunton.—June 6th. The Corporation invites tenders for the supply and erection of engines and alternators in exchange for existing alternators and transformers, also alterations to switchboard, supply of rectifiers, &c. Messrs. Kincaid, Waller and Manville, engineers.

Victoria.—June 24th. The Council of the city of Hawthorne (Colony of Victoria, Australia) is inviting tenders for the supply and erection of buildings, boilers, engines, dynamos, transformers, mains, meters, arc lamps, poles; also running the plant for three years. See our "Official Notices" March 11th.

Watford.—June 8th. The District Council is inviting tenders for the erection of an electric light station adjoining the new sewerage works. Particulars from the architects, Messrs. Gordon, Lowther & Gunton, Finsbury House, Bloomfield Street, E.C.

CLOSED.

Aberdeen.—The Gas and Electric Lighting Committee recently authorised the electrical engineer to accept the offer of Siemens Bros. & Co., Limited, being the lowest, and amounting to £12,138, for the extension of the electric main cable to the harbour and the west end of the city. The committee recommended the borrowing of the further sum of £15,000 in connection with the electric lighting undertaking. The Council approved of these matters.

Chester.—The Council has accepted the tender of Messrs. Johnson & Phillips for the supply of 11 arc lamps at £136 odd.

FORTHCOMING EVENTS.

1898.

Friday, May 27th, at 5 p.m.—Physical Society, Burlington House. Agenda, "A Simple Interference Method of Reducing Prismatic Spectra," by Mr. E. Edser and Mr. Butler. "Some further Experiments on the Circulation of the Residual Gaseous Matter in Crookes Tubes," by Mr. Campbell Swinton.

At 9 p.m.—Conversazione at the Institution of Civil Engineers.

Thursday, June 2nd, at 8 p.m.—Chemical Society, Burlington House. Papers to be read:—"The Action of Ether on Organic Acids and on Carbo-hydrates in presence of Hydrogen Bromide," by H. J. H. Fenton, M.A., and Mildred Gostling, B.Sc.

Wednesday, Thursday, Friday, and Saturday, June 8th, 9th, 10th, and 11th.—Municipal Electrical Association Conference. See our "Notes" this week.

Thursday, June 16th, at 9 p.m.—Institution of Electrical Engineers' Conversazione at the National History Museum, South Kensington.

NOTES.

Electricity Direct from Water-power.—Herr Josef Popper describes in the *Electro-techniker*, May 15th, 1898, an ingenious method of obtaining electric currents directly from water-jets without the intervention of a hydraulic motor. He does not appear as yet to have reduced his invention to practical form, but it is just possible that there is something of practical value in it. It is a well-known principle that if a conductor moves so as to cut magnetic lines of force, that an E.M.F. is produced at right angles to the lines of force and to the direction of motion. If, now, a water-jet passes through a strong magnetic field—say between the poles of a strong electro-magnet—and the terminals of a circuit are brought in contact with the opposite sides of the jet, a current will flow through the circuit. Any number of jets may be used and connected up in series to obtain a useful electromotive force. The water of streams and waterfalls being by no means pure, will probably not have so high a resistance as to render the idea impracticable on that account—at least, so says the inventor. Popper thinks that steam and gas jets may be used in the same way, when currents of high tension and small quantity are required. This scheme, if practicable, would have the great advantage of reducing the cost and simplifying the construction of water-power installations. Popper states that he has been working at the idea since 1895.

"Scientific American" Naval Supplement.—The publishers of the *Scientific American* have very opportunely issued a "Special Navy Supplement," in which they include a brief history of the United States navy between the years 1883—1898 with the authorisations up to date. Any information respecting the fleet of either parties to the present war is of great interest, and the illustrations and general descriptive notes of the U.S. battleships, cruisers, monitors, gunboats, torpedo boats, &c., may be perused with profit. There are valuable tables of statistics, a coloured map of Cuba, and an explanation of the method of classifying the various types of war vessels. Messrs. Munn & Co., of 361, Broadway, New York, are the publishers.

Smoke Nuisance.—On Wednesday last week, at Bow Street, the Metropolitan Electric Supply Company were fined £5 5s. on one summons, and 6s. on each of 19 others, for having on 20 days between April 19th and May 11th allowed the chimneys at their Sardinia Street station to emit black smoke in such quantities as to cause a public nuisance. An order for the abatement of the nuisance was made by consent. The secretary of the company explained that, owing to the coal strike in South Wales, they were unable to get their usual smokeless coal.

Electric Railways in Europe. — Some interesting statistics showing development of electric railways in Europe within the last three years are published in the *Elektrotechnische Zeitschrift*, March 31st, p. 209. The statistics are arranged in two tables; one showing the extension in different countries, and the other the various systems in use. These tables are as follows:—

The Nature of an Oath.—It is said that a well-known counsel, a familiar figure in electrical lawsuits, was examining a youth the other day, and asked him if he knew the nature of an oath. "Don't I just!" replied the boy with evident glee. "Was'nt I your caddie for three days when you wos playin' golf a few weeks ago; and then you arst me, Do I know the nature of an oath!"

The First! The Best! The Last!—Hoult's original *electro-chemical* chimney and flue cleaner is a late discovery and invention for cleaning soot and scales out of stove pipes and ranges by a practical and scientific method. It more than does the work of a sweep, it requires but a few moments' time, it does its duty thoroughly, and all for *sixpence*. By burning an electro-chemical flue cleaner in a stove or furnace, it generates a gas *charged with electricity* that decomposes the soot, destroys all combustible matter, and causes it to pass out with the draught, leaving the pipe both free and clean. Here is a rare chance for an investigation by Lord Kelvin or Prof. J. J. Thomson into the electrification of electro-chemical stove pipe gases. "Mr. Hoult is indeed a very ingenious Yorkshireman," says the *Stationery World*. Just the sort of man, we would add, to keep the world, slowly as it moves, from absolute stagnation.

Appointment.—The Dewsbury Corporation has appointed Mr. O. M. Jonas, lately with Messrs. Ferranti, Limited, and the Newcastle Electric Supply Company, as borough electrical engineer at a salary of £250 per annum. There were 76 applications for the post.

The First Electric Automobile.—It is a fine thing for a modest man to have champions, and Mons. Raffard, the French engineer (whom we might fairly term "well known") finds his cause as inventor and designer ardently advocated by a friend in a journal called *Le Chauffeur*, a copy of which has just reached us. The article would appear to be written in defence of Mons. Raffard's title to the first practical designs for electric automotor vehicles actually carried out into operation on the road, and it recalls the original Faure accumulator patent of 1880 as a starting point. Some few months after this (in April, 1881, to be exact) Mons. Raffard made arrangements with the Paris Omnibus Company to take one of their vehicles for conversion to electric working, and at the same time completed an electric tricycle provided with 12 small Faure cells, the electric equipment weighing altogether about 160 lbs. The omnibus was completed, and ran on the streets in May and June, 1881, but was not shown at the Electrical Exhibition owing to an accident, which caused heavy repairs with a lawsuit to follow. This omnibus was one of the ordinary type, no alterations to the main structure or design being allowed, and was operated by means of a belt driving on to a differential pulley, which allowed for change of speed in either of the driving wheels. The differential pulley was mounted on a countershaft connected to the driving wheels by chain gear, with pinions and toothed discs on the driving wheels. The advocate of Mons. Raffard's claim to be the first in the field with an electric automobile, considers that this vehicle (which ran either on the tram rails or the ordinary road surface at will) took precedence not only of the small electric railway at the Electric Exhibition of that year, but should also be regarded as the first practical result achieved for real working, although the Berlin Exhibition of 1880 had a small electric line in operation. Probably Mons. Raffard may claim with justice the first electric motor car for street work; certainly he did more than many others to advance the automobile, for in 1883 he had a tramcar running in Paris both on the rails and the road for 30 miles at a time. This vehicle weighed complete, in working order and fully loaded, about 11 tons. Not contented with claiming precedence for Mons. Raffard in regard to self-contained electric omnibuses, and even tramcars, the contributor to *Le Chauffeur* also tries to show that he must be considered the originator of heavy electric locomotives. Certainly he patented in France, towards the end of 1883, the details of an electric locomotive which compares very favourably with those now so well known in connection with the Baltimore Belt Line railroad. Not the least ingenious or interesting feature of the Raffard locomotive may be considered the method of elastic coupling together of driving wheels, with the driving discs mounted on the multipolar motor armature shaft. It is perhaps hardly correct to call the latter a "shaft," as it is hollow, like a sleeve, and surrounds the main driving axle. Whether or no Mons. Raffard was actually the first to design a workable electric omnibus, and also an electric locomotive for heavy working, the fact remains that he can claim credit for some very ingenious details that perhaps even yet have not come into the extensive use which their value and good points deserve.

The Efficiency of Transformers.—In a recent number of the *Elektrotechnische Rundschau*, Herr Schlatter, in an article on transformer distribution (which is condensed in the *Practical Engineer*), draws attention to the fact that, notwithstanding the very high efficiency of transformers at full load, they nevertheless show but a very low all-day efficiency when permanently connected across the mains, and states, as the result of experience of central stations, that the total energy delivered by a transformer during 24 hours is approximately equal to the energy it would deliver in one-twelfth of the time if worked at full load, and on this assumption he gives the all-day efficiencies, together with other data, of transformers of various capacities, which we append in the form of a table below:—

Output of transformer in kilowatts ...	1	2·5	5	10
Useful energy in kilowatt-hours ...	2	5	10	20
Iron losses in kilowatt-hours	1·56	2·28	3·72	5·52
Copper losses in kilowatt-hours ...	0·04	0 09	0·17	0·31
Meter losses in kilowatt-hours ...	0·288	0·288	0·576	0 864
Total energy absorbed, kilowatt-hours	3·888	7·658	14·466	26·694
All-day efficiency	0 515	0·625	0 692	0 75

To check the value of the assumption, equal numbers of the four types of transformers given in the table were connected across the mains from a large central station, when the mean all-day efficiency worked out at 0·652, or practically a mean of the efficiencies of the four types. With the object of increasing the all-day efficiency, the house transformer system has been abandoned in favour of the transformer substation system, with which the number of transformers may be greatly reduced, with a corresponding increase in their size and efficiency. The distinct economy of such a change has been shown by the results obtain in a town in Massachusetts, where 57 small transformers were replaced by 18 of a larger size. In this instance the total core loss of the small transformers, supplying about 1,500 lights, was 5,870 watts, whereas the 18 larger ones substituted supply 1,624 lights with a total core loss of only 1,348 watts. In order to reduce the losses as much as possible, it is necessary to keep only so many transformers in circuit as will enable them to work at full load, or nearly full load.

Some Recent Tests of Materials, &c.—*Technology Quarterly* publishes from time to time tests made in engineering laboratories, which are of some interest. In a recent number are given results of tests on bolted joints, some 14 in number, with a view to finding the efficiency. All the best specimens were made from plate of a tensile strength of 68,000 lbs., and bolts of machine steel of 96,300 lbs. tensile strength, the bolt holes being drilled and rimmed to take the turned bolts an easy driving fit. Two joints, which showed an efficiency of 65·2 per cent., were made with plates 14·64 inches wide and ·45 inch thick. There were three bolts pitched 4⅞ inches centres; they were 1¼ inches diameter. The net plate section was 4·90 square inches after rimming, and the tension on this section was 59,600 lbs. per square inch. The shear on the bolts was 39,700 lbs. per square inch. The compression on the plate was 173,100 per square inch, and failure was by tearing of the plate through the bolt holes. The bolts were damaged only. In the next tests, with plates 11·55 inches wide of a net area of 3 96, with two 1⅜ inches bolts pitched 5¾ inches. The plate tension was 49,000 lbs., the bolt shear 32,700 lbs., the plate compression 156,700, and the joint efficiency only 55 per cent., the joint failing by shearing of the bolts; yet the maximum shear was less than that which failed to shear the bolts of the last test. A repetition test showed almost the same figures. After the test the bolt holes were about half an inch longer than their width. In a one-bolt joint, with plates about 5½ inches wide and 1⅜ bolts, which sheared at a unit stress of 32,600 lbs., the joint efficiency was 59 per cent. and the plate tension 53,200 lbs. Generally these and previous tests seem to show that the strongest joints were those which failed through the plate; that when joints failed at the bolts by shearing, the unit shear was less than the stress, which did not shear the bolts when the plates failed; also, that when the plates failed, the strength of both plates and bolts was better developed than when the bolts failed. The lesson seems to be that generally there should be an excess on the side of the bolts. Generally, with bolts from ¾ inch to 1⅜ inches at pitches of 2 inches to 5¾ inches the joint efficiency only varied between limits of 57 and 65 per cent., the best results being with 1¼-inch bolts. All the plates were ·43 inches to ·45 inches thick, but the maximum plate tension per unit net area was greatest with the more numerous small bolts. Tests of wrought-iron pipe columns about ¼ inch thick and from 2 inches to 6 inches inside diameter showed, for the 2 inches to 4 inches columns, when from 6 feet to 10 feet in length, a crushing strength between 21,000 lbs. and 27,000 lbs. per square inch of cross-section, while for the columns 4 inches to 6 inches diameter the strength varied from 27,000 lbs. to 32,500 lbs. for lengths of 8 feet to 15 feet. The first lot of smaller columns merely had ordinary screwed-on cast-iron flanges; the second lot of larger size had the ends turned off square, and supported on cast-iron caps. Well made pipe columns may thus be rated at a crushing stress of, say, 25,000 lbs. per square inch, a useful figure to know, as wrought-iron columns of short length are often very convenient and useful, and easily made, from readily procurable materials.

American Society of Mechanical Engineers.—The above society holds its conference from Tuesday next, May 31st, to June 3rd, at Niagara Falls. The opening address will be delivered by Hon. Arthur Hastings, Mayor of Niagara Falls, and the work and methods of the Cataract Construction Company will be afterwards described by Messrs. Coleman Sellers and W. A. Brackenbridge. On the Wednesday the power works will be visited. There will be a number of papers read on mechanical engineering and allied subjects.

The Bastian Meter.—It has been suggested in some quarters that when reading the paper on electrolytic meters before the Institution, Mr. Gibbings did not give due credit to Mr. Bastian, the inventor of the meter. We happen to know that it was the express wish of the inventor that his name should not be mentioned, and it was in carrying out this request that omission of Mr. Bastian's name was made.

Electrically Operated Dredgers.—We described some time ago an electrically worked dredge which was being used in Spain, and was driven from a shore plant. In the minutes of *Proceedings of the Institution of Civil Engineers* a year or two back will be found a description of a dredge, electrically operated, and in use on a New Zealand river for gold recovery from the river bed, the rivers of Southern New Zealand being full of gold, which is only recoverable by dredging. In Colorado, where there are large deposits of auriferous gravels, dry dredgers and excavators have been brought into use by the Bennett Amalgamator Manufacturing Company. The dredger is what in England would be called an excavator. It is of the ordinary steam navvy type, with scoop bucket as used on canal and railway work. It is carried on a car body 40 feet long by 12 feet wide, built up of 20-inch rolled girders, and supported on two four-wheel diamond trucks. The amalgamator is carried at one end of the frame, and serves to balance wholly or in part the dredger boom. This boom is like the jib of a crane, and with its appurtenances will swivel round a central pillar, the swivelling power being a 5 H.P. General Electric Company's motor through bevel and spur gears. A 25 H.P. motor, with double reduction spur gear, actuates the dredging scoop and derrick motion. There is a third motor of 5 H.P. to move the dipper handle up or down in the main jib. Three motors perform every movement necessary. The amalgamator is driven by its own motor of 25 H.P., which also travels the whole machine on its rails and also drives the tailings elevator. Water to the amount of 1,600 gallons per minute is furnished by a fifth motor, and a 15 H.P. motor receives this water and discharges it, after it has done its work, to beyond the crest of the tailings pile. A 150 kw. dynamo supplies all the current, and may be placed anywhere convenient for either fuel or water power. The voltage is 500. The capacity of the dredge is great—200 yards per hour. The dipper swings twice a minute, and cuts a 60-feet circle to a depth of 8 feet below the rail level. Electro-magnetic brakes are provided to the three dredger motors, which have rheostat reversing controllers all mounted in the cab within reach of one man. The brakes are not strap brakes, but magnetic clutches arranged to draw a large disc against a stationary face with a releasing spring to push the disc back when the brakes are off. The pumps and amalgamator run constantly, and so only require rheostat starters. One man on the machine, with two men for track laying and in the pit are sufficient to handle the whole machine satisfactorily, apart, of course, from the attendance at the boiler house if steam power is the original source of power. The company build also river dredgers for gold recovery, self-contained, as necessary.

Cleaning the Globes of Enclosed Arc Lamps.—In an article in the *Electrical World*, Mr. J. H. Hallberg remarks that the trimming and cleaning of the inner globes on enclosed arc lamps is of the utmost importance, as the efficiency and candle-power depend, to a large extent, on the transparency of the inner globes. It will be found that most of them are covered inside with a grey-white dust, or film, which comes off if the globe is washed in clean water; but some, even after they are washed in water, show a brown-black stain around the top of the globe which apparently will not come off, no matter how much it is washed; in fact, it appears as though it were a natural colour in the glass itself. This is due to several causes. The most common is the impurity of the carbons, which contain too much metallic material; another is too great a length of the lower carbon, which brings the arc too near the neck of the inner globe; or the cause may be too much current flowing across the arc, especially during the few minutes after trimming the lamp with new carbons, this causing an excessive flame, that gets in contact with the globe, and in that way stains it. The only way to clean a globe in this condition is by dipping the burned part in hydrofluoric acid. This acid is very dangerous to handle, and much care should be exercised when it is used. As this acid will eat through almost every material except lead and wax, it must be kept in a jar of either of those materials. Mr. Hallberg prefers lead, as the acid gets warm when it acts on the glass, and he has seen cases where the wax melted and let the acid run out.

The War and the Cables.—It is stated in official circles at Madrid that the Spanish Government has decided, if the cable from Cuba is cut by Americans, to send some auxiliary vessels to cut all the cables landing in the United States territory.

The *Times* Washington correspondent says that it is proposed to close without delay the three remaining cable exits from Santiago de Cuba to Jamaica and Hayti, whence there is a choice of six routes to Spain. Little danger, it is thought, will attend the cutting of these cables, and no doubt is entertained as to the right of the United States to cut them, although most of them belong to British companies. General Greely, the chief signal officer, advanced the principle that the right existed to destroy cables in waters within Spain's jurisdiction. This principle has been accepted, and the Government are acting upon it.

The *Times* New York correspondent says that the censorship on cable despatches which now exists is of a somewhat crude form. Each company seems to be acting as its own censor, and the feeling is that the Government itself should assume responsibility instead of the company's clerks.

The following communication on the general question of submarine cables in war time appeared in Tuesday's *Times* from the pen of Prof. T. E. Holland, of Oxford:—

I venture to think that the question which has been raised as to the legitimacy of cable cutting is not so insoluble as most of the allusions to it might lead one to suppose. It is true that no light is thrown upon it by the Convention of 1884, which relates exclusively to time of peace, and was indeed signed by Lord Lyons, on behalf of Great Britain, only with an express reservation to that effect. Nor are we helped by the case to which attention was called in your columns some time since by Messrs. Eyre & Spottiswoode. Their allusion was doubtless to the "International" (L.R., 3 A and E., 321), which is irrelevant to the present inquiry. The question is a new one; but though covered by no precedent, I cannot doubt that it is covered by certain well-established principles of international law, which, it is hardly necessary to remark, is no cut-and-dried system, but a body of rules founded upon, and moving with, the public opinion of nations.

That branch of international law which deals with the relations of neutrals and belligerents is, of course, a compromise between what Grotius calls the *belli rigor* and the *commerciorum libertas*. The terms of the compromise, originally suggested partly by equity partly by national interest, have been varied and re-defined, from time to time, with reference to the same considerations. It is perhaps reasonable that, in settling these terms, preponderant weight should have been given to the requirements of belligerents, engaged possibly in a life and death struggle. "*Jus commerciorum æquum est*," says Gentili; "*at hoc æquius, tuendæ salutis.*" There is accordingly no doubt that in land warfare a belligerent may not only interrupt communications by road, railway, post, or telegraph without giving any ground of complaint to neutrals who may be thereby inconvenienced, but may also lay hands on such neutral property—shipping, railway carriages, or telegraphic plant—as may be essential to the conduct of his operations, making use of and even destroying it, subject only to a duty to compensate the owners. This he does in pursuance of the well-known *droit d'angarie*, an extreme application of which occurred in 1871, when certain British colliers were sunk in the Seine by the Prussians in order to prevent the passage of French gunboats up the river. Count Bismarck undertook that the owners of the ships should be indemnified, and Lord Granville did not press for anything further. Such action, if it took place outside of belligerent territory, would not be tolerated for a moment.

The application of these principles to the case of submarine cables would appear to be, to a certain point at any rate, perfectly clear. Telegraphic communication with the outside world may well be as important to a State engaged in warfare as similar means of communication between one point and another within its own territory. Just as an invader would, without scruple, interrupt messages, and even destroy telegraphic plant, on land, so may he thus act within the enemy's territorial waters, or, perhaps, even so far from shore as he could reasonably place a blockading squadron. It may be objected that a belligerent has no right to prevent the access of neutral ships to unblockaded portions of the enemy's coast on the ground that by carrying diplomatic agents or despatches they are keeping up the communications of his enemy with neutral Governments. But this indulgence rests on the presumption that such official communications are "innocent," a presumption obviously inapplicable to telegraphic messages indiscriminately received in the course of business. It would seem, therefore, to be as reasonable as it is in accordance with analogy that a belligerent should be allowed, within the territorial waters of his enemy, to cut a cable, even though it may be neutral property, of which the *terminus ad quem* is enemy territory, subject only to a liability to indemnify the neutral owners.

The cutting, elsewhere than in the enemy's waters, of a cable connecting enemy with neutral territory, receives no countenance from international law. Still less permissible would be the cutting of a cable connecting two neutral ports, although messages may pass through it which, by previous and subsequent stages of transmission, may be useful to the enemy.

A brief note appeared in yesterday's *Times*, from Messrs. Eyre & Spottiswoode, in reply to the above.

A *Daily Chronicle* despatch, dated New York, Tuesday, says that "shortly after midnight much excitement was caused here by the discovery that the Western Union Telegraph and Telephone wires to Sandy Hook were interrupted. These wires connect the harbour fortifications and city. It is supposed that the interruption was effected by Spanish agents. The Postal Telegraph Company's wire is still working."

According to the *Financial News*, the New York *Sun* has received news from St. Thomas showing that the recent bombardments of Santiago de Cuba and Guantanamo arose from some cable-cutting exploits by the United States cruiser *St. Louis* and the gunboat *Wampatuck*. The *St. Louis*, while picking up a cable off Santiago, came within range of the Morro Fort there, and instantly became a target for its guns. The cable was severed, and the vessels left for Guantanamo, where similar incidents took place. They silenced the shore batteries and cut the cable.

Municipal Electrical Association Meeting.—The programme of the third annual convention of this association is to be held at the Royal United Service Institution, Whitehall, S.W., on June 8th, 9th, 10th, and 11th. The president of the year is Mr. A. H. Gibbings; the vice-presidents being Messrs. Faraday Proctor, and Wilmshurst. The presidential address will be delivered on Wednesday morning, and the papers down for discussion are as follow:—

"The Management of Electrical Undertakings," by Councillor Hesford, Southport Electricity Committee.

"Switchboard Apparatus," by J. R. Blaikie, Chief Assistant Electrical Engineer, Bristol.

"Steam - using Plant," by J. A. Jeckell, Borough Electrical Engineer, South Shields.

Visits will be paid to the Waterloo and City Railway, and to the Islington Electricity Works; and in the evening the Association Dinner will take place at the Holborn Restaurant. On Thursday papers will be discussed as follow:—

"Uniformity of Plant," by C. H. Wordingham, Manchester.

"Appropriation of Profits and Repayment of Loans," by Bailie W. Maclay, convener of the Glasgow Electricity Committee.

"Single *v.* Multiple Generating Stations," by J. F. C. Snell, Sunderland Borough Electrical Engineer.

Visits will be paid to the works of Messrs. Willans & Robinson, Limited, at Rugby, Croydon electricity works, and the General Electric Company's lamp works. On the Friday papers are to be discussed as follow:—

"Electric Traction," by R. C. Quin, Blackpool borough electrical engineer, and J. E. Stewart, Derby borough electrical engineer.

"Accumulators in Connection with Lighting and Traction," by J. H. Rider, Plymouth borough electrical engineer.

"Stand-by Supply," by R. C. Quin, Blackpool.

Visits will be paid to Messrs. Siemens Bros. & Co.'s works at Woolwich, and the Shoreditch electricity works. The business meeting will be held on Saturday, June 11th, and in the afternoon visits will be paid to the Portsmouth and Dover electricity works.

Death by Electricity.—Our New York namesake, having reprinted from our columns Dr. Hedley's recent article on "Death by Electricity," Dr. J. Mount Bleyer writes to that journal criticising the article, saying:—

I carefully looked over the article, and must say that I failed to learn therefrom anything original, either from investigations or suggestions on the part of the author. The whole matter contains nothing but a rehash of what others have done. I therefore cannot find a single peg or plea—to hang it upon—for his having written this article except for reviewing some of the already known works of others. As father and one of the first experimenters on electrocution, a few words in answer to this review will be acceptable to your readers, &c., &c.

As a matter of fact, Dr. Hedley's article was what it was intended to be—a judicial summary of all that is worth knowing on the subject of death by electricity. It was not written to proclaim his own praises, nor to claim anything for himself—not even the title of "Father of Electrocution," or foster-father of the high-sounding phrase "dynamic apoplexy" (a term used by Dr. Bleyer in his letter), which, in the present connection, means about as much as Mesopotamia.

The New German Cable.—We understand two officials of the German Government have arrived in London to discuss the question of the proposed new German cable from the Azores across the Atlantic.

Copper.—The *Engineer* asks, "Is there to be a copper famine?" In the reply to this question, says our contemporary, the boilermaking and general engineering trades are vitally interested. And certainly the way in which the copper market has been jumping lately makes such a query not at all unreasonable. During last year this metal has been higher than the year before by an average of £2 per ton, and this advance has recently been greatly accentuated by the war. The production and consumption of copper was on a greater scale in 1897 than in any previous year in the history of the trade, no less than 396,723 tons having been produced, against 373,368 tons in 1896. Yet notwithstanding this great increase of 23,000 tons, the present visible supply in this latter part of May is at least 5,000 tons less than it was 12 months ago. The general increase in the consumption of copper for electrical engineering services and for marine engineering purposes is chiefly responsible for this diminution. European consumers are depending to a greater extent than ever before upon American supplies. The trans-Atlantic production has been, and still continues to be, on a very large scale. The price of copper to-day is altogether out of proportion to the quantity available for use, it being £2 per ton cheaper than at the same date in 1891, although the visible supply—or quantity in stock—is less than half what it was in 1891. In fact, the present stock is only sufficient for five weeks' consumption, and if the war between the United States and Spain is prolonged—for they, of course, are the two chief producing countries—there is no knowing to what extent the supply may be diminished; so that a copper famine is quite within the bounds of possibility, and those who have much to do with this useful metal in any capacity will act wisely if they regulate their operations in accordance with that possibility. Any real scarcity would, however, be only temporary, for new sources of supply are not infrequent—the latest copper discovery being just announced from Russia, where extensive copper ore beds have been found at Potar, only 10 miles from a point on the Samarkand-Andidsban railway.

Obituary.—The death is announced of Mr. R. Stuart Hampson, of Mayfield, Withington, at the early age of 37 years. At the time of his death Mr. Hampson was the electrical engineer of the Great Central Railway Company, and also of the Manchester and South Junction Railway. He joined the service of the Great Central about 11 years ago as telegraph engineer and superintendent, and since then he has carried out many important engineering works. Previously, as an assistant of the late Mr. E. C. Warburton, telegraph superintendent of the Lancashire and Yorkshire Railway Company, Mr. Hampson erected the electric light installation—one of the first in the country—at the grain silo at Fleetwood, in the early eighties. Mr. Hampson was a member of the Institution of Electrical Engineers, and was president of the Association of Railway Telegraph Engineers and Superintendents of Great Britain for the years 1896-7-8. He was a frequent contributor to scientific and electrical journals, and his professional advice was frequently sought.

Personal.—We are glad to be able to inform the many friends of Mr. H. Hirst, of the General Electric Company, of London, that he is now recovering from the serious operation which was quite successfully performed on Tuesday last.

Queensland Electrical Association.—On the initiative of Mr. John Hesketh, the Government electrical engineer, an electrical association is being formed for Queensland. The association would have for its objects the promotion of the general advancement of electrical and telegraphic science and its applications, the facilitating of the exchange of information and ideas on these subjects amongst its members and the general public, and would hold meetings, publish papers, &c. The *British Australasian* says that at a recent meeting at Brisbane a committee was formed for the purpose of drafting rules for the approval of a subsequent meeting. The committee consists of Messrs. J. S. Badger, E. G. Barton, C. H. Caspersonn, J. H. Durant, and J. Hesketh. Mr. J. Power, Post and Telegraph Department, Brisbane, is secretary to the committee.

Röntgen Rays in Warfare.—Before the Royal United Service Institution on Friday last, Surgeon-Major Beevor, M.B., Army Medical Staff, lectured on the "Working of the Röntgen Ray in Warfare." The lecturer said, according to the *Times* report, that his object was to give his experience in the working of the X ray in military surgery, and through the kindness of many official friends he would be able to give the audience the results of its employment on the recent frontier expedition in India, and then to lay before them some modifications in the construction of the appliances for generating the X ray which had suggested themselves to him after working among the wounded on the field of battle and its adjacent hospitals. He then exhibited, by means of the magic lantern, photographs of cases from the Frontier War, which showed with the utmost clearness the importance of the use of the X ray in the treatment of wounded men. The positions of bullets in various parts of the body were made perfectly evident in cases where it was quite impossible to localise the bullets by ordinary surgical methods. The lecturer said that it was not only possible, but quite easy to have an X ray apparatus working at the front. The cases exhibited contained indisputable proof that even in savage warfare, where the Geneva Convention was unknown, the X ray could be brought under control, and an immensity of human suffering obviated; it was not necessary that every field hospital or bearer company should be supplied with an apparatus, as it could be readily transported from one part to another of the field of operations. He felt sure they would see what an advantage it was to be able to localise bullets, and other foreign bodies, without the painful process of searching with probes, and that a threefold advantage was gained in the treatment of patients by this means—first, the absence of any pain or physical injury, from which arose the second advantage, that in cases where there had been much loss of blood or injury to bone, they were enabled to ascertain the exact condition of affairs, without the risk of increasing the depression of the patient by operation, and they thus gave him the best chance of reaction, upon which depended his recovery. He maintained that it was now the duty of every civilised nation to supply its wounded in war with an X ray apparatus, among other surgical aids, not only at base hospitals, but close at hand, wherever they might be fighting and exposing themselves to injury in the performance of their hazardous duty. The rest of the lecture was devoted to the consideration of technical questions in connection with the appliances required for generating the X ray.

Electric Light Wires as Telephonic Circuits.—In a letter to *Nature*, Mr. F. J. Jervis-Smith, of Oxford, describes a method of using electric lighting wires as telephonic circuits. He was requested some time ago to try to localise a fault in an electric light main, by means of a certain form of inductor used in conjunction with a telephone but not connected to the main. While using it, it occurred to him that probably the main might be used instead of a telephone wire. His first experiments were not productive of good results, as a small fraction of the company's current passed continuously through the telephone. In October, 1897, he placed $\frac{1}{2}$ microfarad condensers in his telephone circuit at each end; these stopped the current, but in no way reduced the telephonic effects. If the note given out by virtue of the rotation of the armature of the dynamo is great, it can be very greatly reduced by placing an inductively-wound resistance in the circuit. The resistance, he writes, does not appear to modify the telephonic effects in any marked degree. This probably arises from the fact that the E.M.F. due to the secondary coil of the telephone transmitter is high. The experiment was successfully made over two miles of a main which was carrying the full load used in lighting the town.

The Royal Society.—The following were among the papers down for reading yesterday afternoon:—Prof. Roberts-Austen, F.R.S., "On Surfusion in Metals and Alloys." Dr. J. Larmor, F.R.S., "Note on the Complete Scheme of Electro-dynamic Equations of a Moving Material Medium, and on Electrostriction." E. Wilson, "Aluminium as an Electrode in Cells for Direct and Alternate Currents." Dr. Capstick, "On the Kathode Fall in Gases."

Fatal Shock Accident at Chelmsford.—On Saturday, 21st inst., Edward Fell, the outdoor foreman of the Chelmsford Electric Lighting Company, went to a small transformer pit to switch off the transformer with a view to removing some secondary leads. He switched off the transformer, and afterwards, whilst removing some high pressure leads with his ungloved left hand, touched another high pressure lead with his right hand, and was immediately killed. The inquest was opened on Monday, 23rd inst., but was adjourned until yesterday (Thursday). Major Cardew held an official inquiry into the matter on Tuesday.

Erratum.—In the evidence given before the Select Telephone Committee, on page 722 of this issue, *Mr. F. T. Lamb* should, of course, read as Mr. J. C. Lamb, C.B.

NEW COMPANIES REGISTERED.

Cowans, Limited (57,378).—Registered May 16th, with capital £30,000 in £5 shares (2,000 7½ per cent. cumulative preference), to carry on the business of electricians, suppliers of electricity, mechanical and general engineers, contractors, machinists, &c. The subscribers (with one share each) are:—T. S. Cowan, 4, Marlborough Road, Ealing, solicitor; C. C. Smith, Bengeo, Hertford, gentleman; A. E. Hale, 18, Austin Friars, E.C., clerk; H. J. Wells, 5, Victoria Grove, Stoke Newington, clerk; E. W. Cowan, Hart Hill, Bowden, Cheshire, civil engineer; E. J. Cowan, 26, Kenilworth Road, Ealing, gentleman; A. J. Wells, 5, Victoria Grove, Stoke Newington, clerk. The number of directors is not to be less than three nor more than seven; the subscribers are to appoint the first; qualification, £250; remuneration, £50 each per annum. Registered by E. W. Cowan, Hart Hill, Bowden, Cheshire.

Leyland and Birmingham Rubber Company, Ltd. (57,410).—Registered May 18th, with capital £300,000 in £1 shares, to adopt agreements (1) with the Leyland Rubber Company, Ltd.; (2) W. Stanley Morrison & Company, Limited; and (3) with "The Birmingham India-Rubber Company," and to carry on the business of manufacturers and dealers in India-rubber, gutta-percha, flax-hose, flax and cotton belting, &c., electricians, telegraph and electrical engineers and contractors, cable and telegraph instrument manufacturers, pneumatic and other tyre manufacturers, cycle manufacturers and dealers, motor car builders, engineers, machinists, &c. The subscribers (with one share each) are:—J. E. Baxter, Highfield, Leyland, Lancashire, manufacturer; J. W. Brown, Beech Mount, Bolton, cotton waste dealer; S. Whitehead, Sunnyside, Leyland, manager; J. W. Kenyon, The Hollies, Bury, gentlemen; J. A. Fallows, 14, New Brown Street, Manchester, salesman; E. T. Everett, 3, Stevenson Square, Manchester, merchant; R. T. Byrne, 124, New Street, Birmingham, manufacturer. The number of directors is not to be less than three nor more than seven; the first are: J. E. Baxter, A. S. Morrison, R. T. Byrne, J. W. Brown, and S. Whitehead; qualification, £2,500; remuneration, £52 10s. each per annum. Registered by Jordan & Sons, Limited, 120, Chancery Lane, W.C. Registered office, Golden Hill Works, Leyland, Lancashire.

The Caledonian Wire Rope Company, Limited (3,875).—Registered at Edinburgh, May 17th, with capital £20,000 in £10 shares, to carry on in the United Kingdom or abroad the business of manufacturers of wire ropes, electric cables, telegraph wires and lightning conductors and wire fencing of every description. The subscribers (with one share each) are:—J. Wilson, Airdrie House, Airdrie, M.P.; R. Moore, 156, St. Vincent Street, Glasgow, C.C.; R. Wilson, 75, Bothwell Street, Glasgow, coal master; J. Dixon, 127, St. Vincent Street, Glasgow, coal master; J. Mitchell, Airdrie, banker; W. Hugh, Thornhill, Blantyre, wire rope maker; J. Hugh, Thornhill, Blantyre, wire rope maker. The first directors are J. Wilson, R. Wilson, J. Mitchell, W. Hugh and J. Hugh. Qualification, £100. Registered by Oswald & Son, Edinburgh.

Werner Cadmium Electric Accumulator Syndicate, Limited (57,417).—Registered May 19th, with capital £6,000 in £1 shares, (2,250 preference), to adopt an agreement with Alexis Werner, and to carry on the business of an electric accumulator and electric supply company, also electricians, mechanical engineers, and electrical apparatus manufacturers. The subscribers (with one share each) are:—H. Simmons, 5, Sydenham Park, S.E., engineer; R. S. Keary, 1, Lea Hall Road, Leyton, E., clerk; T. L. W. Ginger, 39, Roseman Road, S.W., traveller; L. Sternberg, 22, Little Alie Street, Aldgate, E., clerk; G. Goodman, 21, St. Helen's Place, E.C., solicitor; M. Goodman, 21, St. Helen's Place, E.C., clerk; W. G. Richardson, 88, Dempsey Street, Stepney, clerk. Registered without articles of association. Registered office, Devonshire Chambers, Bishopsgate Street Without, E.C.

Electric Theatre, Limited (57,446).—Registered May 20th, with capital £5,000 in £1 shares, to erect, produce, construct, organise, exploit and show an electric theatre or music hall, and to carry on the business of electricians, mechanical engineers, suppliers of electricity, &c. The subscribers (with one share each) are:—J. H. Harrison, 31, Bow Street, W.C., costumier; A. J. Thomas, 30, Regent Street, S.W., gentleman; S. Jonsiffe, Grosvenor House, Kensington Park, wine merchant; J. L. Camp, 1, Spridgdale Road, Stoke Newington, artist; A. R. Kelly, 5, Camden Square, N.W., surveyor; E. Tremearne, 34, Gresham Street, E.C., accountant; M. W. Taylor, 34 and 36, Gresham Street, E.C., solicitor. The number of directors is not to be less than three nor more than seven; the subscribers are to appoint the first; qualification, £250; remuneration as fixed by the company. Registered by Stanley & Co., 45, Ludgate Hill, E.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Barcelona Tramways Company, Limited (6,544).—This company's return was filed on March 24th, when 23,000 shares were taken up and paid for in full out of a capital of £300,000 in £10 shares.

Anglo-Portuguese Telephone Company, Limited (24,545).—This company's return was filed on April 15th, when 50,000 shares were taken up out of a capital of £75,000 in £1 shares, all of which are considered as fully paid.

Edmondson Electricity Meter Syndicate, Limited (41,756).—This company's annual return was filed on April 26th, when 175 shares were taken up out of a capital of £2,000 in £1 shares; 168 are considered as paid, and £7 has been received.

Eastbourne Electric Light Company, Limited (16,422).—This company's annual return was filed on May 3rd, when 1,949 shares were taken up out of a capital of £50,000 in £10 shares, and paid for in full.

Edison-Gower Bell Telephone Company, Limited (16,010).—This company's return was filed on April 15th, when 385,009 shares were taken up out of a capital of £500,000 in £1 shares. 370,000 have been considered as paid, £15,005 has been received, and £4 is in arrears.

CITY NOTES.

The Worcester Accounts.

The result of the year's working is that the gross profit amounts to £2,195, the net deficiency, after setting aside amounts for sinking fund, being £1,474. The works' costs are slightly higher than those of last year, and the reasons given by Mr. Ruthven Murray in his very excellent report to the municipality are as follow:—

"The greater consumption of fuel during last year is mainly responsible for the higher works' cost, and it at first sight appears paradoxical that while so many more units were generated by water-power, the coal account should have increased. The following is the explanation:—By reason of an increased private day load and public lighting load, extending daily over many hours, it was possible to use more water-power when the supply was plentiful, but it necessitated more steaming on low loads when the limits of the water-power were exceeded, or when no water could be obtained. During the fall of year, when the flow of water was exceptionally small, the percentage of steaming hours and steam generated units became very high. Owing to the engineers' strike and the stoppage of work, we were unable to get any of the extension plant which was ordered last year. The day load engine, which was more than ever required, has only just been delivered. Consequent upon the increase of the mean load, and the small flow of water, the steaming hours increased from the previous year's 33 per cent. to 45 per cent. of the total, and the cost of coal, per sold steam unit generated, from 1.06d. to 1.32d. With the new small engine at work, I look forward with confidence to a reduction in this figure for the present year.

The following table gives the cost per unit:—

	1897.	1896.
Total capital expended	£67,298	£60,718
Number of units sold	429,270	333,644
Number of lamps connected	—	—
Revenue from sale of current	£5,948	—
Net revenue	£2,195	—
Average price obtained per unit ...	8·14d.	—

Cost of Production.	£		Per unit.	1896.
Coal	1,328		·74d.	—
Oil, waste, water, and engine room stores	144		·08d.	—
Salaries and wages at generating station	1,176		·66d.*	—
Repairs and maintenance of buildings, engines, boilers, dynamos, &c.	744	Works' cost 1·90d.	·42d.*	—
Rent, rates and taxes	87		·05d.	—
Management expenses, directors' remuneration, salaries of managing engineer, secretary, clerks, &c., stationery and printing, general establishment charges, auditors, law charges and insurance	485		·27d.	—
Depreciation of buildings and plant account	—		—	—
Renewal fund account	—		—	—
Total	£3,964		2·22d.	—

Revenue.	£	s.	d.	Average price obtained per unit.
By sale of current	5,948	0	0	3·14d.
Meter rents, &c.	192	0	0	—
Supply of steam		—		—
Transfer fees		—		—
Other items	151	0	0	—
Total	£6,291	0	0	3·14d.

Total cost per unit (exclusive of depreciation and renewal accounts), 2·22d.; works' cost, 1·90d.

* Including charges for public lamps.

The Shoreditch Electric Lighting Accounts.

The lighting accounts of the Shoreditch Vestry for the nine months ending March 25th, while presenting some interesting features, are nevertheless incomplete, because they do not include any statement setting forth the financial results of the dust destructor. Though dust destruction and electric lighting go hand in hand in the parish of Shoreditch, we understand that it is impossible to do otherwise than present separate accounts. Before an extended criticism were offered it would be necessary to have complete figures relating to both departments of the undertaking, and we shall therefore wait until the publication of the dust destructor accounts.

The form of the accounts is by no means a model of perspicuity, and it is to be regretted that the Board of Trade form is not adhered to. The net result of the undertaking is, that after providing for redemption of capital and payment of interest, there is a profit of £2,072. Of this sum £1,255 goes to pay off previous calls on the rates, which leaves a round sum of £700 to be carried forward. No provision has been made for depreciation. The least satisfactory feature in the report is the statement relating to electricity generated, and we reproduce the table as it stands:—

STATEMENT OF ELECTRICITY GENERATED, SOLD, &c.

Quantity generated in B.T. units.	Quantity sold. Public lamps.	Quantity sold. By contract.	Quantity sold. Private consumers by meter.	Quantity sold. Total sold.	Quantity used on works.	Total quantity accounted for.	Quantity not accounted for.	Number of public lamps.	Total maximum supply demanded.
491,107	80,791	...	203,504	284,295	156,725 including that quantity used by lift and fan motors, also loss in distribution.	441,020	50,087	57 arcs, 114 incandescents (32 C.P.)	408 kw.

"As the works have been taken to the water, fuel has also to follow, and at a moderate estimate the extra cost for increased railway dues and cartage on the 1,702 tons of coal used was £127, which should, of course, be deducted from the revenue derived from the water-power. It may also be noted that the above sum represents 6 per cent. on £2,100."

If we add to the amount of electricity used in works and lost in distribution, the quantity unaccounted for, we arrive at 206,812 units, which is not far off half the total quantity generated, and is in excess of the total current sold to private consumers.

An analysis of the cost of production shows the following:—

	1897.	1896.
Total capital expended	£87,802	—
Number of units sold	284,295	—
Number of lamps connected ...	—	—
Revenue from sale of current ...	£6,118	—
Net revenue	£3,730	—
Average price obtained per unit ...	5·14d.	—

Cost of Production.	£		Per unit.	1896.
Coal	279		·23d.	—
Oil, waste, water, and engine room stores	226		·19d.	—
Salaries and wages at generating station	774		·65d.	—
Repairs and maintenance of buildings, engines, boilers, dynamos, &c.	276	Works' cost 1·30d.	·23d.	—
Rent, rates and taxes	19		·02d.	—
Management expenses, directors' remuneration, salaries of managing engineer, secretary, clerks, &c., stationery and printing, general establishment charges, auditors, law charges, and insurance	412		·35d.	—
Depreciation of buildings and plant account	—		—	—
Renewal fund account	—		—	—
Total	£1.9:6		1·67d.	—

Revenue.	£	s.	d.	Average price obtained per unit.
By sale of current	6,118	0	0	5·14d.
Meter rents, &c.	—			—
Supply of steam	—			—
Transfer fees	—			—
Other items	3,643	0	0	—
Total	£9,761	0	0	5·14d.

Total cost per unit (exclusive of depreciation and renewal accounts), 1·67d.; works' cost, 1·30d.

The Electric Railway and Tramway Carriage Works, Limited.

The prospectus of this company has been before the public this week, the list of subscriptions closing on Wednesday. The nominal capital is £150,000 in £5 shares, and the present is an issue of 22,000 shares, of which the vendors, who are the promoters of the company, have agreed to take 3,000 in part payment of the purchase money. The company has been formed to manufacture all classes of cars and railway carriages, but especially tramway cars for horse, electric, and cable roads, and vehicles for light railways. The production of electric motor trucks and steel underframes for Indian and Colonial railways, will also be a feature of the undertaking. The company has also been formed to acquire valuable property and works in West Strand Road, Preston, Lancashire, having an area of nearly 12½ acres, about 9½ acres, of which will be used by the company for the above purposes.

The present is considered the right moment to bring out the company, in view of the extensive movement all over the country in the adoption of mechanical traction.

The vendors will furnish and equip the works with machinery of the most modern character, and lay down plant for driving the principal machinery by electric motors. They will also construct an overhead electric tramway system through the works and grounds, so that all cars manufactured can be properly tested before leaving the works.

It does not appear that the company is to acquire any business reputation or connection, or to take over any orders, but it is expected that the works, *when completed*, will be capable of an output of 600 cars per annum at least, although, as we presume the works cannot get into full working order for some little time, profits may have to be waited for. The company will sell cars and other rolling stock on the hire-purchase system as required.

Mr. Wm. Wilson has reported upon the value of the works and property, and *when completed* they will, in his estimation, work out at £59,465. Mr. Stephen Sellon has reported upon the contract for the equipment of the works, and both his and Mr. Wilson's statements are included in the prospectus.

The vendors are to receive £80,000, payable as to £65,000 in cash and £15,000 in fully paid shares, leaving £30,000 available for working capital. The directors are: George Richardson, Esq., chairman North Metropolitan Tramways Company, chairman; George F. Fry, Esq., J.P., director Brisbane Electric Tramways Company, Limited; Richard H. Prestwich, Esq., deputy-chairman Blackpool and Fleetwood Tramroad Company; John Kerr, Esq., director Edinburgh and District Tramways Company, Limited; George Flett, Esq., director Newcastle and Gosforth Tramways Company, Limited. The secretary (*pro. tem.*) is Mr. Frederick Crimes, 13, Spring Gardens, Manchester.

The West African Telegraph Company, Limited.

The report and accounts of the directors for the year ended December 31st, 1897, presented to the thirteenth ordinary general meeting, held at Winchester House, 50, Old Broad Street, London, E.C., yesterday, states that the company's revenue for that period amounted to £64,722 15s. 2d., against which £21,212 9s. 2d. is charged for ordinary expenses, and £18,780 4s. 4d. for expenditure relating to repairs of cables, &c. After providing £860 2s. 3d. for income-tax, and £225 1s. 3d for re-valuation of currency assets, there remains a balance of £23,644 18s. 2d, to which is added £459 10s. brought from the preceding year, making a total available balance of £24,104 8s. 2d. From this balance there has been deducted £10,098 9s. for interest on debentures, and £13,633 6s. 8d. for sinking fund, leaving a balance of £372 12s. 6d., which it is proposed to carry forward to next year. The director who retires by rotation is Robert Kaye Gray, Esq., who, being eligible, offers himself for re-election. The auditors, Messrs. Deloitte, Dever, Griffiths & Co., also retire, and offer themselves for re-election.

The Marquis of Tweeddale presided at the ordinary meeting of the company.

The Chairman said the gross revenue for 1897 was £64,723, a decrease of £6,266 compared with 1896; this was accounted for by the falling off in the Cape joint-purse traffic, which amounted to £1,693, the increased loss in exchange of £2,699, which could not possibly have been foreseen, and to increase under the head of rent of cable, £1,074. The last increase was explained by the interruption of cable between Bathurst and St. Vincent, which occurred simultaneously with interruption to communication by the East Coast, compelling them to divert traffic on to lines not belonging to the company, and for which they had to pay rent. The total working expenses for the year amounted to £21,212, or an increase of £3,314. Repairs of cables was £18,780, or a decrease of £1,915. Although this was a decrease, the figures were still exceptionally high. The French Government still continued to withhold subsidies, the action of the Government being due to difference of opinion, based on certain clauses of their concession. They were anxious to maintain good relations with the French Government, and they submitted a proposal for the settlement of the differences, conceived in a very liberal spirit, and they had reason to think it was acceptable. It had not yet received the confirmation of the Chamber, which was probably accounted for by the election nearly concluded. They hoped before long to come to an arrangement satisfactory to all parties.

The report and accounts were then adopted. Mr. Robert K. Gray, the retiring director, and the auditors, were then re-elected.

British Aluminium Company, Limited.—This company has, during the past week, been inviting applications for an issue of £100,000 5 per cent. debentures, of which £18,000 has already been applied for and allotted to shareholders. The list closed on Wednesday, 25th inst. The money is required to provide for a larger output at the different factories, the necessary additional works being now in course of construction.

Brazilian Submarine Telegraph Company, Limited.—The directors have declared an interim dividend of 3s. per share, or at the rate of 6 per cent. per annum, free of income-tax, for the quarter ended March 31st, 1898, and payable on June 24th. The transfer books of this company will be closed from June 17th to the 23rd, both days inclusive.

Detroit Telephone Company.—The directors have declared a quarterly dividend of 2 per cent., being at the rate of 8 per cent. per annum, payable on and after 16th inst., to all holders on the register on April 30th.

TRAFFIC RECEIPTS.

The Bristol Tramways and Carriage Company, Limited.—The receipts for the week ending May 20th, 1898, were £2,696 13s. 9d.; corresponding period 1897, £2,483 19s. 1d.; increase, £212 14s. 8d.

The City and South London Railway Company.—The receipts for the week ending May 22nd, 1898, were £987; week ending May 23rd, 1897, £958; increase, £29; total receipts for half-year, 1898, £21,666; corresponding period, 1897, £21,461; increase, £205.

The Dover Corporation Electric Tramways.—The receipts for the week ending May 14th, 1898, £135 5s. 11d.; total receipts to May 14th, 1898, £2,217 8s. 7d. Week ending May 21st, 1898, £127 16s. 5d.; total receipts to May, 1898, £2,209 19s. 1d.

The Dublin Southern District (Electric) Tramways Company.—The receipts for week ending Friday, May 20th, 1898, were £563 3s. 4d.; corresponding week last year, £669 17s. 10d.; decrease, £106 14s. 6d.; passengers carried, 88,163; corresponding week last year, 95,616; aggregate to date, £8,921 1s. 1d; aggregate to date last year, £9,367 15s. 9d.; decrease to date, £446 14s. 8d.; mileage open, 8 miles.

The Liverpool Overhead Railway Company.—The receipts for the week ending May 22nd, 1898, amounted to £1,416; corresponding week last year, £1,386; increase, £30.

The Western and Brazilian Telegraph Company, Limited.—The receipts for the week ending May 20th, 1898, after deducting 17 per cent. of the gross receipts payable to the London Platino-Brazilian Telegraph Company, Limited, were £2,259.

PHYSICAL SOCIETY.

ORDINARY MEETING, May 13th, 1898.

MR. SHELFORD BIDWELL, President, in the Chair.

A PAPER by Prof. W. E. AYRTON and Mr. J. MATHER, on GALVANOMETERS, was read by Prof. AYRTON.

It is a sequel to *Proc. Physical Soc.*, Vol. x., p. 393, and to *Phil. Mag.*, Vol. xxx., p. 58. The authors suggest that in future the comparative sensitiveness of galvanometers should be expressed in terms of the number of millimetre scale-divisions per micro-ampere, when the observed image or "spot" is one metre from the mirror. Unit angular deflection is, therefore, one two-thousandth of a radian. Further, for the periodic time, *i.e.*, the time between two transits of the "spot" across some fixed point on the scale, in the *same* direction, the standard should be 10 seconds. It is also proposed to reduce the factor of sensitiveness, as regards resistance, to the common basis of one ohm. The assumption is that, for a given galvanometer, the deflection per micro-ampere is proportional to the two-fifth power of the resistance of the windings. Tables accompanying the paper give complete data for a large number of galvanometers constructed during the past ten years, and it is possible to trace the improvements in sensitiveness throughout that time. The most sensitive galvanometers are the oscillographs, they have very short periods; the moving parts are small; the controlling fields very strong. They are designed to indicate the character of rapidly-varying currents. An oscillograph, as improved by Mr. Duddell, was exhibited; its period is 0·0001 per second, and its factor of sensitiveness, according to the authors' classification, is greater than any yet obtained. A distinction is drawn as to the use of the term "dead-beat." Maxwell applies it to galvanometers in which the motion is "aperiodic," *i.e.*, to those in which the suspended system, before coming to rest, passes only *once* through the position of equilibrium. This meaning is retained; it is not to be confused with "quick-moving" or "short-period." A pendulum illustrating these distinctions was exhibited. As regards insulation of galvanometers and shunt-boxes, the authors now apply the "guard-wire" principle of Mr. W. A. Price. The instrument to be insulated is enclosed in a metal case, provided with a terminal to which one end of the windings is connected. The second end of the windings passes out through an ebonite bush piece. This arrangement is said to nullify leakage and to prevent electrostatic disturbance of the suspended system. In the second section of the paper the authors calculate the limiting sensitiveness of galvanometers of the "Thomson" type. The investigation is based upon Prof. Schuster's B.A. 1894 paper, it takes into account the period of the suspended system, and the specific magnetisation of the needle. Lastly, the authors discuss the relative merits of long and short periods, *i.e.*, the best "control," for galvanometers intended to indicate zero points in potentiometer operations. They conclude that if the control can be readily altered, and if the sensitiveness can be adjusted for the test, then, for rapidity of working, the "control" should be so adjusted that the sensitiveness is approximately two or three times greater than is absolutely needed for the desired accuracy.

Prof. THRELFALL thought the author's method of comparing galvanometers very misleading. The results obtained in their comparison of the oscillograph (3,310,000), and the suspended-coil galvanometer (27) might be regarded as the *reductio ad absurdum* of the proposed system. The absurdity arose from the dissimilarity of the two instruments. Moreover, the proposed system ignored the fact that sensitiveness may be obtained by optical as well as by electro-magnetic means. Optical sensitiveness, owing to its greater stability was to be preferred to electro-magnetic sensitiveness. The fundamental problem in the construction of galvanometers is an optical one, it is necessary to decide the mass and dimensions of the suspended parts so as to ensure (1) optical accuracy, and (2) electro-magnetic sensitiveness. Thus, to some extent the weight of the mirror determines the thickness of the suspension. As an instance of what might be done by optical methods, Prof. Threlfall referred to work done by himself and Mr. Brearley (*Phil. Mag.*, 1896), in which it was possible to measure to $1·48 \times 10^{-13}$ amperes, and, with special refinements, to 3×10^{-14} amperes. He had found that the best diameter for glass mirrors was 1·1 cms., with a weight just under 0·5 grammes. These were used with a scale at 276 cms., read by a microscope to 0·04 mm. The course of the light was: lamp, large lens, small scale, mirror, eye-piece. The period was 25 secs., and the resistance 10,000 ohms. Even better results could be obtained by using mirrors of quartz or of bloodstone. Quartz is incomparably to be preferred to glass. Such figures indicated what could be done by optical sensitiveness, the sensitiveness that the authors ignored. It was pointed out by Prof. Threlfall that the controlling field for galvanometers of the "Thomson" type should be straight and uniform. This was best secured by using two magnets, one above and one below the needles.

Prof. PERRY said the authors had not asserted that a galvanometer with higher figure of merit, according to their classification, was *superior* to another of lower figure. It must be agreed that the figure they obtain is a very valuable datum for the comparison of instruments designed for similar purposes; for instance, in classifying those used by Prof Threlfall, Mr. Duddell was to be congratulated on the extreme sensitiveness and small period of his oscillograph.

Prof. AYRTON, referring to Prof. Threlfall's *reductio ad absurdum*, admitted that the criticism would carry some conviction if the two instruments were of different kinds; if, for instance, one possessed a suspended needle and the other a suspended coil. But the argument failed, because both instruments were of the suspended coil type. In one of them Mr. Duddell had developed the advantages to be gained by reducing the air-gap. To form an opinion of electro-magnetic improvements in galvanometers, it was necessary to reduce the results of all instruments to some system of classification. There was no objection, after that, to adding a good mirror and reading by a good microscope.

The PRESIDENT proposed votes of thanks to the authors, and the meeting adjourned until May 27th.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

THE PREVENTION OF INTERRUPTIONS TO ELECTRICITY SUPPLY. By LEONARD ANDREWS, Associate. Read May 5th, 1898.

(*Concluded from page* 708.)

Fig. 5 is a sectional elevation of a similar cut-out modified for use in connection with high-tension currents. In this arrangement the contacts are screwed and sweated into metal pots, and immersed in water. This serves effectually to quench any tendency to arcing

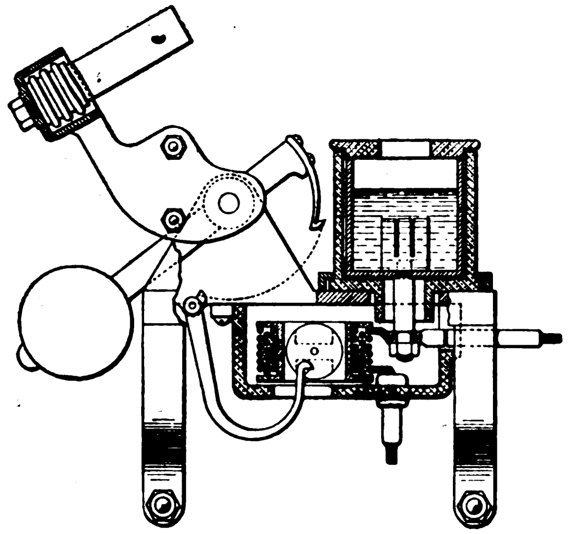

FIG. 5.

when large high-tension currents are interrupted. All the high-tension parts in this cut-out are entirely covered with porcelain or other insulating material. The releasing mechanism is practically the same as in the low-tension cut-out.

Fig. 6 is a diagram of the Hastings switch gear. We have found this arrangement entirely satisfactory in every respect. It has not only enabled us to cope with several breakdowns to machinery without interruptions to the supply, but it has also effected a saving in coal, &c., during the past 18 months of over £400. This has been saved by the arrangement referred to enabling us to work safely without running a spare plant.

All the machines are arranged to feed into a common pair of inner and outer 'bus bars. The inner 'bus bar, however, is divided at A by a change-over switch, C, into two separate branches. One of these, A_1, is permanently connected to A, but the other branch, A_2, may be connected either to the main 'bus bar or to a spare 'bus bar, B. Normally, it is connected to the former. Each machine and circuit is equipped with a two-way switch, T, by means of which any machine or any circuit may be connected either to the inner 'bus bar or to its auxiliary branch. In the diagram only three circuits and three machines are shown. The maximum output of the machines is 60 amperes, and the total load of the three circuits is assumed to be 120 amperes—namely, 60 on No. 1, 40 on No. 2, and 20 on No. 3. By setting the circuit two-way switches, T_2 and T_3, over to the left, circuits 2 and 3 are connected directly on to the A_1 branch of the inner 'bus bar; whereas, T_1 being set over to the right, circuit 1 is connected on to the A_2 branch. The machines Nos. 2 and 3 are connected in parallel by their two-way switches directly on to the inner 'bus bar, A. And the machine No. 1 is kept turning as a spare, with its two-way switch over to the right, thereby connecting it on to the spare 'bus bar, B. The change-over switch, C, is constructed to

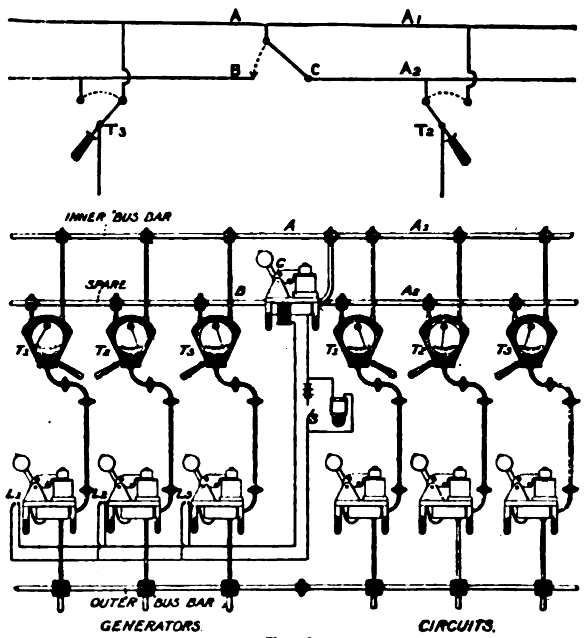

FIG. 6.

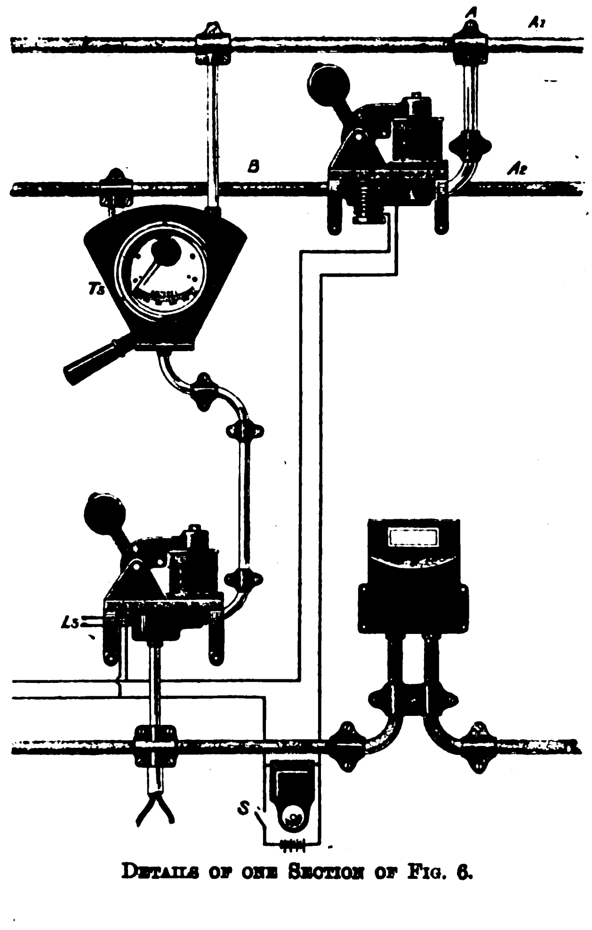
be released by a solenoid excited off any convenient source, E. Inserted in series with it are two switches, S and L_1, L_2, or L_3. Both the S and one of the L switches must be closed together to excite the



DETAILS OF ONE SECTION OF FIG. 6.

solenoid. When S only is closed it completes a circuit through an electric bell, which can be heard anywhere in the station. The driver has instructions that whenever that bell rings he must immediately run the spare plant up to speed. Now if either of the running plants break down, the switchboard attendant merely has to close switch S, and then as soon as the volts on the spare machine have risen to normal, or before if necessary, he releases the cut-out switch of the faulty machine. The weight of this on falling closes switch L, and so completes the circuit through the solenoid of the releasing change-over switch C. This disconnects the 'bus bar A_2 with its load of 60 amperes from the inner 'bus bar A, and transfers it to the spare 'bus bar B at precisely the same moment as the generator supplying 60 amperes is disconnected from the inner 'bus bar. Thus the lights on the circuits Nos. 2 and 3 are not affected as they would be if the change-over were not done simultaneously with switching out the faulty machine; and the lights on No. 1 circuit only give a momentary flicker, which, as a rule, is not even noticed by the consumers.

Of course the use of a spare 'bus bar is not original, but we believe that the simultaneous method of change-over is.

In the discussion on a paper read before the Northern Society of Engineers on switch gear last year, it appeared to be the general opinion of engineers present that all high-tension connections should be absolutely enclosed. But it was objected that it did not appear possible to do so without having exposed connections at the back of the board, and boards with backs to them increased rather than decreased the risk of accidents. A suggestion was also made in this same paper that a full sized diagram of connections painted on the walls above the switch gear would often prove useful, but other engineers thought that the switch gear should be its own diagram. We venture to think that in the switch gear shown in fig. 6 we have succeeded in complying with both of these specifications. The leads from the machines are carried in porcelain or other insulating pipes directly up to their respective cut-outs, from these to the two-way switches *viâ* their ammeters, and so on to the 'bus bars. All the high tension connections, both in the cut-out switches and the two-way switches, are entirely enclosed; and, as these switches and the conductors are bolted and clipped to the surface of a brick wall, all the connections are diagrammatically shown at a glance.

Some form of excess current cut-out should certainly be used on the feeders. We prefer magnetic cut-outs to fuses, as we find them more reliable. They can also be used as switches if necessary, which is a distinct advantage. At any rate, whatever form of cut-outs is used, their operation should on no account be permitted to interrupt the supply to any consumers.

It is curious that engineers have not paid more attention to the duplication of electrical mains. It is the custom to spend thousands of pounds on duplicating boilers, engines, dynamos, and other plant which is directly under the engineer's control; but no steps are taken efficiently to duplicate that part of the system over which he has no direct control, and which is always at the mercy of such external forces as gas explosions, burst water mains, fires, pick-holes, &c.

It is true many engineers arrange their mains on some ring system, so that any portion of it may be made dead for repairs, extensions,

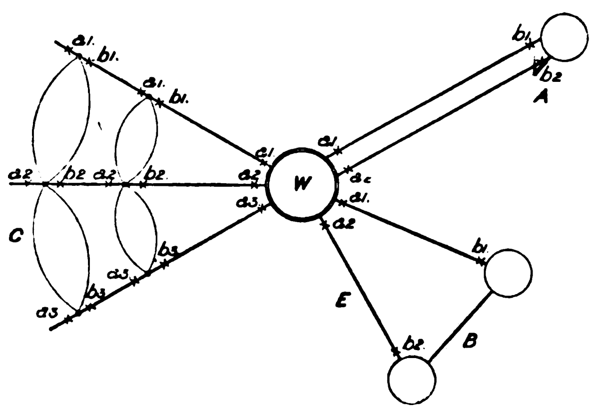


Fig. 7.

&c.; and some go even further, and fix fuses at intervals round the ring, so proportioned that a fault will only cut out a certain section of the lights. But that is not sufficient. We ought not to be satisfied until we are able to guarantee an absolutely constant supply to everyone. The problem of how to do this has been troubling us at Hastings for years. But we now feel satisfied that we have solved it. Our method of doing so is shown in fig. 7.

Each sub-station or feeding point is supplied from the works, W, by two feeders, either by running to each two distinct mains, each sufficiently heavy to carry without excessive fall of pressure half the load of the sub-station, as shown at A, or by connecting together two sub-stations, each supplied by separate feeders, as at B; or, in the case of low tension distribution, by running radial feeders from the generating station, and connecting the several feeding points on these to corresponding feeding points on an adjacent feeder by the distributing mains, as shown at C. If a fault occurs on either of these feeders, the current will be supplied to it both directly from the generating station and also *viâ* the adjacent feeder and connecting mains. To prevent this fault from short-circuiting the whole of the system, fuses have previously been inserted in the feeders at a_1, a_2, b_1, and b_2. A little consideration will show, however, that this arrangement can never be satisfactory, for it is obvious that either one of these feeders may at any time have to carry as heavy a current as the others; consequently, they must all be equally fused. Now, if a short-circuit occurs at, say, E, fuse a_2 will blow. The current will then be supplied *viâ* a_1, b_1, and b_2. Now fuse b_2 should, of course, blow, and so cut out the faulty main, leaving both sub-stations to be supplied *viâ* feeder 1. But this will not happen, because a_1 and b_1 would have to carry sufficient current to blow b_2, in addition to the useful current taken by the sub-stations. The result will naturally be that a_1 or b_1 will invariably blow before b_2, thus cutting off the lights supplied by both feeders. Now, if fuses b_1 and b_2 are replaced by discriminating cut-outs, no amount of current flowing in its normal direction will cause them to operate, but a comparatively small return current will immediately release them. As the only conditions that can possibly cause the current to flow back from the sub-stations to the generating station is a fault on the feeder between these points, this form of cut-out can be relied upon to operate only when it is required to do so.

It is, of course, very essential that the cut-outs used for this purpose should be made not to operate if either the series or shunt current is interrupted separately or simultaneously, as it would cause a great deal of trouble if the supply from the works was ever interrupted for a few seconds and all the cut-outs on the mains were thereby caused to operate.

Cut-outs that are opened with a spring or springs should also be avoided, as it is impossible to make them sensitive and reliable, owing to the fact that the catch has to be released against the maximum tension of the springs; and, further, these springs must be very stiff, as in addition to overcoming the friction of the contacts when they are clean, a large margin must be allowed to overcome the increased friction that will certainly be caused by corrosion of the contacts after they have been in, say, a few months. A falling weight seems much better suited for the purpose than a spring, for the pressure on the releasing catch is comparatively small, and the sharp blow upon the contact arm is just what is required to overcome with certainty any tendency to sticking due to corrosion.

Cut-outs should have no screws about them liable to work loose and so release the catch and open the circuit.

For burying under the pavements they should be as compact as possible, as the space is then very limited.

They should also be unaffected by rust, dust, damp, or corrosion, and precaution should be taken to prevent any possibility of their being caused to operate by external vibration. They should be made to cut out with as small a current as possible, to prevent excessive arcing when the circuit is interrupted.

The cut-out illustrated in fig. 5 has been designed to comply with these and other requirements.

Another very frequent cause of local interruptions is the failure of primary fuses of transformers. It certainly appears to be advisable to use some form of excess-current cut-out between the primary winding of transformers and the mains supplying them. But the object of this cut-out should be, not to prevent the transformers from being overloaded, but to protect the mains from being short-circuited by a faulty transformer. Where two or three transformers are coupled together no good can come of cutting one of them out of circuit because it is overloaded, for if one is cut out the extra load is thrown upon the others, thus invariably blowing their fuses as well and cutting off the supply to the whole district.

We consider that a transformer fuse should not blow unless the excess current exceeds the normal current by about 300 per cent.

Fuses between the secondaries of transformers and secondary 'bus bars are invariably worse than useless. Take, for instance, the case of three transformers of equal size feeding a common 'bus bar. If one of these fails, the current will rush back into it from the other two; but, as these have to supply the useful current to the mains, in addition to that required to blow the faulty transformer's fuse, they will blow their own fuses before that of the faulty transformer. Obviously these fuses should be replaced by discriminating cut-outs

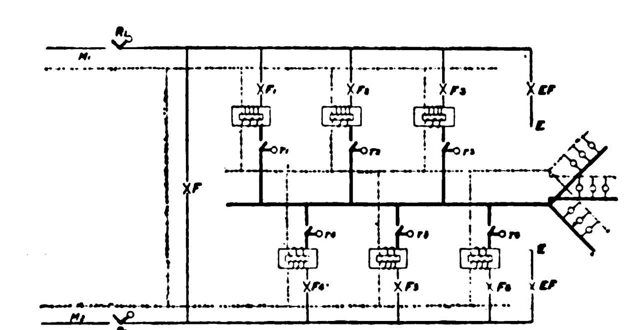

Fig. 8.

Fig. 8 is a diagram showing the equipment of a sub-station we now have in hand. The two high-tension feeders from the generating station, M_1, M_2, terminate in two return-current cut-outs, B_1 and B_2. Beyond the cut-outs they are connected together by the fuse F. Fuses F_1 and F_2, &c., are inserted in series with the primaries of each transformer. Return-current cut-outs, r^1, r^2, r^3, &c., are inserted in series with the secondaries of each transformer. The primary connections of the sub-station are divided into two distinct halves; the inner 'bus bar of each half is equipped with an earthing fuse, E F. Any man found working on the primary connections of either side without the earth fuse inserted will be instantly dismissed. Either half sub-station can, of course, be made dead by opening the return-current cut-out of the feeder to which it is directly connected, fuse F, and the secondary return-current cut-outs of that side.

There are no high-tension connections exposed in this sub-station. The primary cut-outs are of the type illustrated in fig. 5. The fuses are also of an enclosed type, and are screwed to two cast-iron frames

—one frame for each half of the station. A section of these frames is shown at G, fig. 9. The 'bus bar, B, to which the transformer fuses are connected, is supported on insulators inside this frame. These frames are hung on hinges, H, so that they can be lifted to enable the connections to the fuses to be periodically examined. High tension

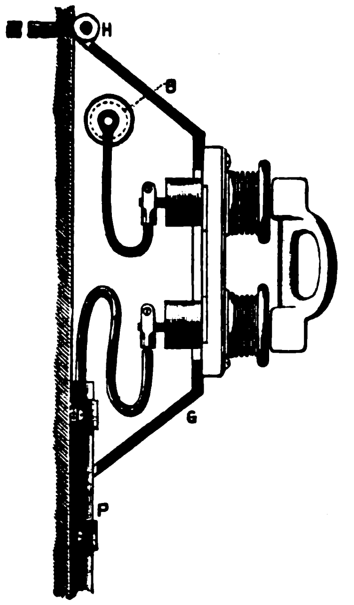

FIG. 9.

cables are run down to the transformers in porcelain tubes, P, clipped to the walls. The high tension apparatus for one half of the station is on the north wall, and that for the other is on the east wall. The low tension return current cut-outs, which also serve as secondary switches, are on the south wall, and the distributing 'bus bars and instruments are on the west wall. This sub-station is a building 12 feet long by 8 feet wide by 7 feet 6 inches high. It is built above ground in a back garden in the centre of the district it supplies. We pay £10 per annum for the rent of the ground it stands upon.

Several of our existing sub-stations are placed under the pavement. These have been such a source of trouble to us that we are now abandoning them entirely.

Arrangements are made to cut off all the transformers except one small one during the hours of light load, not only for the purpose of saving the current wasted in exciting them, but also to allow them to cool down between each heavy shift. We expect by so doing to greatly increase the life of our transformers.

Whether it is advisable to equip the low tension distributors with cut-outs or not, is a question upon which we should be glad to hear the opinion of other engineers. We are inclined to think that, if a 200-volt short-circuit occurred on a cable not exceeding 1 square inch sectional area, it would in most cases burn itself out before it damaged other parts of the cable. If we could be sure of this, we should endeavour to loop all of our distributors and insert in series with each main a magnetic cut-out adjusted to operate when the current exceeded five times the normal. If the main burnt asunder before the cut-outs operated, the supply would not then be interrupted to any consumers.

Presumably everyone will admit that excess-current cut-outs are necessary on electric light services where they enter consumers' premises, but we think the majority of central station engineers will agree with Mr. Sayers when he says that they should not operate until the normal current has been exceeded by at least 300 per cent. Is it not possible that the number of branch cut-outs at present used to comply with the fire insurance regulations might be reduced? It appears to us to be rather a question whether or no so many of these cut-outs do tend to reduce the risk of fires. Consumers who are repeatedly troubled by these branch fuses melting are apt to discover that a fuse replaced by a stout piece of copper wire gives them far less trouble. Now, if the connection to one of these short-circuited fuses should work loose, it gets hot, the heat is transmitted to the cable, and a smell of burning is the result. Of course, if no branch fuses were used, it would be advisable entirely to enclose the house wiring in some form of fireproof conduit instead of in wood casing; but we are inclined to think this would be a preferable arrangement both for the prevention of interruptions to the supply, and for the reduction of fire risks.

FAILURE OF COPPER PIPES.

It is one of the commonest experiences of engineers that materials and processes which for years give satisfaction, suddenly begin to be associated with disaster. One such instance is the brazed copper steam pipe so common in marine practice. For years satisfactory, the brazed pipe has begun to cause disaster.

Undoubtedly the use of copper pipe has come about because good copper is a tough material. It can be worked to fit the requirements of a steamer, and it can be made thin, and will follow the springing of a vessel without risk of fracture. But copper pipe has one unsound part—its brazed joint. These brazed joints have, since steam pressures became so high, commenced to give way, and the disaster on the Elbe, among many others, served to call more particular attention to the subject. At Deptford, at the electrical station, Mr. S. Z. de Ferranti adopted a novel method of pipe construction. He clustered a set of small pipes, aiming to reduce the bursting stress, and to reduce, perhaps, also the outburst of steam in case of any rupture. To give the cross-sectional area of steam, say, equal to that of a 12-inch pipe, will, however, require 16 pipes of 3 inches diameter. Each of these 3-inch pipes must be one-fourth as thick as the 12-inch pipe they replace. The mean circumference of 16 3-inch pipes is fully four times that of the 12-inch pipe, and as the fourth of the thickness of a 12-inch pipe will scarcely be sufficient for brazing purposes, it is probable that there will be a good deal more copper in a Ferranti pipe than in a single pipe of equal capacity, and the thought suggests itself why not use more material in a large pipe, and so increase its factor of safety, just as makers of shell boilers have made good work, where makers of water-tube boilers have sheltered themselves behind small diameters. But if we are to accept recent findings, the fault of copper pipes is in the brazing of them, and no amount of thickness and original excellence can be proof against a brazing which changes its nature, and becomes as brittle as a flower-pot. Various remedies are proposed, such as frequent hoops to confine a rupture within short limits, wire wrapping to take the bursting stress, and that ever dangerous hydraulic test to be applied occasionally, under the false assumption that a hydraulic test to-day will make a pipe safe for a year or two, whereas, in fact, a common result of such test is to put the pipe into a condition to burst when the next pressure of steam comes upon it. The chief engineer of Lloyd's Register of Shipping has reported upon the steam-pipe of the ss. *Pradano*, which exploded in June, 1897, and portions of which have been tested and examined by Prof. Arnold, of Sheffield.

The chief engineer and Mr. Walliker, of Cardiff, came to the conclusion that the failure was due to brazing, *originally sound*, but deteriorated by some cause. The pipe which burst had been made straight, and bent cold, proving the original excellence of the brazing. The Court which sat under the Boiler Explosions Acts of 1882, 1890, came to the conclusion that the brazing had been originally unsound, and they further considered it ought to have been hydraulically tested. They also recommend lap-welded iron or seamless steel as superior to either brazed or seamless copper. The hydraulic test is recommended to be made on pipes above 3½ inches diameter every four years—a rather useless expedient.

There was very little brazing material to be obtained from the burst pipe, but Mr. Walliker found another ship, the pipes of which showed a similar appearance, and had a considerable amount of the solder at the joints. This was submitted to Prof. Arnold, who made microscopic and other inspection, and showed that the brazing had lost a good deal of its constituent zinc, which had been dissolved out by fatty acids of oil or tallow introduced for lubrication either intentionally or as an adulterant. The zinc having disappeared left the copper as a more or less cellular mass with the pores containing the above acids. The percentage of copper was raised considerably, proving the disappearance of the zinc, and there seems no room to doubt this latter had been removed.

If this be so, it points to the absolute necessity of entirely discarding brazed pipe or of ignoring the bursting resistance, and trusting entirely to the wire serving on the outside to withstand all bursting stress. Now that copper pipes are made electrolytically without seam, there ought to be no difficulty in avoiding this very serious difficulty of brazing.

It is not that brazing is weak when made. A brazed pipe when new will test well, and give a sense of security in brazing; but now that brazing is proved so likely to fail under the influence of fatty acids generated by high temperatures it ought to be abolished. We have heard it said that electrolytically deposited copper is not particularly strong. We have no figures before us as we write, but should be glad to publish any reliable figures sent to us. In our opinion, the crux of the matter is not so much in the original tenacity of the material of a pipe as in the continuance of such original tenacity as it may possess. The tenacity being known may be suitably arranged for in the proper thickness of pipe, and if no deterioration takes place, the pipe will be as strong in 20 years as it is when new. The writer has used a good deal of electrically deposited pipe, but not under pressure, and has found it good, sound, and tough material. There appears ample reason to expect that it will remain good. Turnings cut from it were tough, like wire, and had no appearance whatever of any discontinuity of substance as might be feared from the mode of manufacture in their lamina.

Prof. Arnold's analysis of a sample of deteriorated brazing showed as follows:—

Metallic copper	76·8
Zinc oxide	22·5
Fatty acid in terms of oleic acid ...	1·4
	100·7

Yet new brazing solder by the makers of the pipe is supposed to be mixed of half zinc and half copper. A melted up sample showed only 54 per cent. of copper.

Heated to 400 C., pounded in a mortar, and fused with borax so as follow through all the operations of pipe brazing and solder preparation, there was still only 62 per cent. of copper. Yet the deteriorated brazing showed 76 8 of copper, and such zinc as there was was in the form of oxide, whence we find the true percentage of copper must have been much greater—something like 81 per cent.—proving the disappearance of zinc since brazing. The failure of copper pipes is probably hastened by improper design and fixing, insufficient attention being given to expansion. A brazed pipe does not in any case appeal to an engineer's sense of the fitness of things in these days of high pressures, good materials, and facilities for securing solid-drawn or otherwise seamless tubes.

NORTHERN SOCIETY OF ELECTRICAL ENGINEERS.

Electric Elevators, with Special Reference to their Starting and Stopping. Abstract of paper read by W. C. C. Hawtayne, May 16th.

The first electrically-driven elevator to be put to any practical use was, of course, the belt-driven machine. This consists of a winding drum on which the lifting cable coils or uncoils, and which is rotated in either direction by straight and crossed belts. These belts run on loose pulleys when the car is at rest, and are shifted over to an intermediate tight pulley, when motion is required, by means of shifting or shipping gear operated by a rope passing through the car and controlled by the car attendant. A number of these machines can be seen in our workshops and factories, the countershaft from which they are driven in some cases taking power from the works countershaft, and in some cases from a countershaft driven direct by electric motors or other available power.

When you consider that it is only about 15 years since the electric motor was really brought out, and that within a few months it was actually being used for this class of work, you will acknowledge that practical engineers saw at once how eminently suitable the electric motor was for this class of work and that they lost no time in getting it to work.

A number of these machines are still being erected, and though, of course, they differ materially in design from those first constructed, and are greatly superior both as regards safety and efficiency to the pioneer machine, yet the principle underlying them is practically the same.

It was, of course, apparent that one of the first things to do was to produce a suitable starting and stopping arrangement for the motor, for all the first machines had motors that ran continuously.

It was necessary to insert a resistance in the armature circuit of the motor to guard against a sudden rush of current at starting, and in order to control the cutting in and out of this resistance and to operate the main switch, an independent hand rope was provided, operated from the car or from the various landings.

In some cases the armature resistance was cut out by the direct pull of the rope, in others by gravity, the hand rope releasing by means of a cam, an arm which in falling cut out the different sections, the too rapid travel of the arm being impeded by a dash pot.

By the time we had got thus far, it was of course seen that there was a great future for the electric elevator as a passenger conveyer, but before it could be put to this use a decided advance had to be made—what would do for factory use would not do for passenger service.

To begin with, the loss of a few seconds in starting and stopping would be fatal to the usefulness of an elevator in a business office, the jerky motion of starting and stopping by means of a shifting belt would not be tolerated, and the safety devices were crude in the extreme.

An elevator motor must be able to work instantly with a fully loaded car, otherwise no one will be bothered with it. In the early days of motors there were objections made to starting them under load; when they were so started it was considered necessary to transmit their power by means of a belt in order to give elasticity to the system, and one thing that had to be done by the elevator engineer was to obtain a motor with a sufficiently good starting torque, and gear the armature direct to the winding drum, providing fixed brushes, and causing it to rotate in either direction without sparking. With such a machine a single-hand rope was all that was necessary to do the work originally performed by two independent ropes, and this, of course, was an advantage not to be lost sight of, as it at once relieved the car attendant of a lot of responsibility and considerably reduced the risk of a mishap.

I will now pass on to describe the modern passenger elevator as it has come under my own observation, and I think it may prove interesting if I describe at length the Otis machine, this being the one I am naturally best acquainted with.

Here Mr. Hawtayne described the Otis elevator, full particulars of which can be seen by referring to the Electrical Review for February 24th, 1896.

The latest system of electric control used by the Otis Company is one in which a small pilot motor is also used, but I regret I am not yet at liberty to describe it fully. It consists of push buttons in connection with a small pilot motor, actuating a series of contacts. There are two forms of this arrangement, in one of which two buttons are used, one for the *up* motion, the other for the *down* motion and the car stops automatically at any required floor. In the second arrangement only a single push is used. No relays are required with either form.

In addition to the push buttons there are also stops in the car corresponding to the various floors. In the one button arrangement, the stop corresponding to the floor required is pressed, and then the main push is pressed, when the car commences to move towards the floor desired, no matter whether it be above or below the car at that moment. A single push button is also placed on each landing, which, when pressed, will call the car to that floor, automatically stopping it when it reaches the landing. Whenever the car is in use the pushes on the various landings are thrown out of action, so that it is impossible to interfere with anyone who may at the time be using the elevator.

Automatic door contacts and locks are also used with this arrangement, which is one that is especially suitable to private houses, accidents being practically impossible and the general arrangement being so simple that a child can use it with impunity.

I have only had an opportunity of seeing one of the machines made by Messrs. Waygood & Co., but I believe they now make some of similar type to the Otis. In the one in question the motor and gear are at the top of the shaft. A two-rope grip sheave is used instead of a winding drum. The car is counter-balanced, and the car ropes pass over the grip sheave direct to the counter-balance weights—an arrangement I do not care so much about as the drum wind. The grip sheave is geared through a worm shaft coupled direct to the armature of the motor, and the coupling between worm shaft and armature shaft is also used as the brake pulley.

The motor is of the ordinary two-pole kind.

The starting and stopping is affected by a hand rope working over a sheave keyed to a shaft connected with the switch box. Midway on this shaft is a cam, which raises by means of a bar the brake band on the coupling referred to above.

In the switch box is a main switch and a reversing drum operated by the shipper shaft. At the end of this shaft is a small cam holding up a rack and pinion device. When the hand rope is pulled, depressing the cam, the rack falls by gravity, and as the pinion is turned a pair of brushes work round a "resistance commutator" cutting out the coils. I am not aware that there is any means of re-inserting the resistance in case of an accident to the lift attendant, or should the hand rope break. Switches are provided at the top and bottom of the lift shaft to cut off current if the lift should overrun, but unless the brake is also applied the momentum of the car or balance weights might well cause an accident, and if the car should stick, and the hand rope should break, the motor might receive far more current than would be good for it.

Perhaps in the discussion a fuller description of the machine may be given, but from what I remember of some correspondence that appeared in the Electrical Review* a year or so ago, the above description is practically correct, and I think the arrangement might be considerably improved upon.

The United Ordnance and Engineering Company, better known as Messrs. Easton, Anderson and Goolden, have recently taken a large number of orders for electric elevators. The principal feature in their machine is the winding mechanism, by which the disadvantages of a many grooved drum are done away with.

The gear may, as in the case of all drum machines, be placed either at the top or bottom of the lift shaft or even remote from it. It consists of a motor of either multipolar or two-pole type driving a sheave, usually provided with eight grooves, through the medium of a worm gear. A slightly smaller sheave, having four grooves, is placed either above, below, or to the side of the winding sheave according to circumstances and has its axle slightly skewed with respect to that of the main sheave.

Usually four wire ropes are employed, and they are led from the cage, either direct or over guide pulleys, first round four grooves of the winding sheave, then round the four grooves of the smaller or cross-over sheave and finally round the remaining four grooves of the winding sheave and away (over guide pulleys if required) to the balance weight.

The advantages claimed for this arrangement are:—

(1) Saving in the space occupied by the gearing, the length of travel of the car not affecting the size of the winding sheaves.

(2) Any number of ropes may be used to suspend the cage and the balance weight, without greatly affecting the size of the apparatus.

(3) The ropes always lead off in the same position and do not require space for lateral travel as when a drum is used.

(4) The car and counter-balance weights being all in one, less rope is required than with the ordinary drum.

A magnetic brake is used connected as usual in parallel with the shunt circuit of the motor.

The control of the armature resistance in the machine used to be, and I believe still is, effected by a centrifugal governor, driven off the armature shaft and cutting resistance in and out as the speed of the armature decreases or increases.

I have tried this arrangement on small service elevators, but always found it troublesome.

An emergency switch is generally fitted arranged to break the main circuit, and so cause the car to stop if by any chance its motion should not be arrested at the end of its travel by the usual stop on the hand rope.

As the company have the contract for the elevators at the New Brighton Tower, which is in the immediate neighbourhood, I hope we may hear something more of their machine in the discussion. I should like, for instance, to know what would happen to the winding ropes and counter-balance weights if the hand rope were to break and the car be brought to a standstill through any hitch occurring.

So much has been written of late about the screw and nut machine of Mr. F. J. Sprague that, although it is a distinct type in itself, I will leave it out of consideration in this paper.

The New Central London Railway some time ago entered into a contract with the Sprague Electric Company for two experimental elevators to be placed in the shaft of their Notting Hill Station, and these have done so well that I believe the firm have now obtained the contract for all the other elevators on the line.

These cars are to carry from 12,000 to 17,000 lbs. at full load at a speed of from 150 feet to 180 feet per minute.

* See our "Correspondence" columns for February 28th, March 6th, 13th, 20th, 27th, and April 3rd, 1896.—Eds. Elec. Rev.

The general arrangement is on the lines of the Sprague ordinary drum-type machine, and is somewhat similar to that of the Otis Company already described. The motor is iron-clad and shunt wound, having its armature coupled direct to a double worm shaft; the two driven gear wheels do not intermesh, but are bolted to two other gears which do intermesh and turn the winding drum.

The starting and stopping is effected by a pilot motor worked from a circular switch in the car; the brake is magnetic, and the car attendant can vary the speed of the car by the operation of the switch. The handle of the switch works against a spring action, so that if the attendant lets go or is pushed away from his post, the handle flies back, and the circuit being thus broken, the car comes to rest at once.

The duty of the pilot motor is to complete the armature circuit, and, by means of a revolving arm passing over faced contact pieces, to cut out the armature resistance.

The car attendant, by moving his switch to contact No. 1, lifts the brake and gives the machine full field; on the second contact he starts the pilot motor, which cuts out the armature resistance till he considers the car has attained the right speed; he then comes back to contact 1, or else moves on to other contacts connected with a resistance in the field circuit of the driving motor. When the handle of the car switch is returned to the normal point the revolving arm in connection with the armature resistance is returned to its normal position.

The machine is provided with a slack cable device, and a switch in connection with this device opens the brake magnet circuit and applies the brake directly anything goes wrong with the ropes.

I had hoped to give a description of the Central London Railway machines, together with some figures showing their efficiency at various loads, but I understand this is to appear shortly from the pen of Mr. Sprague himself. It will, however, give you food for thought when I say that at full load the actual efficiency of the Notting Hill machines from motor terminals to lifting ropes is as high as 70 per cent., and at one-third load 50 per cent.

I append results of tests made on two typical Otis machines, one of which was erected nearly four years ago in an office at Glasgow, the other about 18 months ago in a private house in London:—

In conclusion, gentlemen, I would draw your attention to the tremendous strides that are being made in the elevator business. I have seen it boldly stated, and I have no doubt it is true, that in the States more people are carried vertically in elevators than horizontally by street cars. When the electric elevator was introduced here makers of hydraulic lifts went about trying to prove how expensive they were to buy and to maintain, but most of them have since been converted, and now that they have mastered the principles of the machinery, and have seen the immense advantages to be obtained by the use of electric power, they have started into the field themselves. Some of the machines produced are very good, some are marvels of how not to do it. I was called to one a few weeks ago in London—it was a case where the lowest tender was accepted, —which absolutely had not a good point about it, and on which I refused to travel. A specification had been prepared by the manufacturers duly setting forth that the machine was equal to any of the more expensive machines, and would be provided with switches and all the latest improvements, including resistance in the armature circuit to be cut out as the machine acquired speed. The consulting engineer was satisfied and the contract made. The resistance in the armature circuit turned out to be a hand arrangement, and the motor now has to run continuously, being thrown on by a wonderful friction gear; it is only brought into use on the "up" motion, and the car drops by gravity on the "down" motion, acquiring speed at such a pace that the shock of stopping nearly throws the passengers off their legs, and brings in the safety device nearly every time. You can hear the noise of the gear wheels (not worm gearing) out in the street, and the whole construction of the machine is bad. A great deal of experience and thought is required to design a first-class elevator, and I hope many of you will take the subject up. At present, there is no alternate current motor that I know of that can be used in this connection. This is an enormous drawback, for many of our largest towns are supplied, as you know, on the alternating system, and I have personal knowledge that many orders could be obtained for electric elevators in these places if the machinery was forthcoming. Perhaps during the discussion someone may be able to show us how to do it.

I had hoped to give you more data with regard to loads and efficiencies, but manufacturers are still averse to letting others know too much, and so I have only been able to give you generalities. Data that I have been promised has not yet come to hand; when it does I may find a means of communicating it to you, if the subject is of sufficient interest.

THE TELEPHONE SERVICE.—CONFERENCE AT SPRING GARDENS.

At the County Hall, Spring Gardens, on Monday, Mr. McKinnon Wood (chairman of the London County Council) presided over a Conference between the London County Council and Municipal Corporations, representatives being present from Belfast, Brighton, Salford, Bedford, Liverpool, Huddersfield, Leeds, Halifax, the City of London, Blackburn, Gateshead, Leicester, Newcastle-on-Tyne, Norwich, Oldham, Plymouth, Portsmouth, Sheffield, Cardiff, Tunbridge Wells, and Bradford.

The Chairman, in opening the Conference, said that the matter of the Telephone Company was one upon which great disadvantages would arise from isolated action. They had had to call that Conference upon short notice, because the Select Committee which had been appointed had begun to take evidence. The evidence given was of a very interesting character, showing that the position of the National Telephone Company throughout the country was an exceedingly strong one, and one which behoved them, as representatives of the towns of the country, to consider with a good deal of care. A practical monopoly had been conferred upon the Telephone Company, he thought he might say, without the safeguards which were usually attached to such a monopoly. They had to consider how far the telephone service was likely to prove of general benefit, and how far there was a possibility of its further extension, if it could be perfected and reduced in cost. He thought it was obvious that municipal authorities would not go in for a telephone system if a license was only granted to them to 1911. The L.C.C. had passed no resolution for submission to the meeting.

Mr. J. W. Benn (L.C.C.) moved: "That in the opinion of this Conference the telephone service is calculated to become of great general benefit, and is so much in the nature of a monopoly, that it ought not to be left permanently in the hands of private undertakers." He said that it would be a great advantage to the State if it decided to take the telephone system over, to have a municipal system working beside a private company.

The Town Clerk of Salford seconded the resolution, which was carried.

Mr. Thornton (L.C.C.) compared the cost of the telephone system in Stockholm and Douglas with that of London, and said it was reserved to the greatest city in the world to be charged eight times as much for their service as the people of Stockholm. He moved: "That the evidence afforded by foreign towns and cities shows that similar places in this country—especially London—do not utilise the telephone for business and private purposes to nearly the same extent as abroad, and that such non-user arises mainly from excessive charges and inefficient service."

The Town Clerk of Liverpool, in seconding the motion, said that the inefficiency of the service was in a great measure due to the short-sighted policy of the Government, who might have acquired the whole system for £100,000 years ago, whereas now it would cost millions. He suggested the addition of the following words: "And the failure of the Post Office Department to provide an adequate number of trunk lines to connect the local exchanges."

The addition was accepted, and the resolution, as amended, agreed to.

The Lord Mayor of Belfast next moved: "That in the event of the Post Office being unable to take over the whole telephone service of the country, it is practicable and advisable that municipal authorities should be empowered to provide such service in their respective localities, on the understanding that every facility will be afforded for close co-operation between the local authorities and the Post Office."

The Town Clerk of Leeds seconded.

The Town Clerk of Huddersfield moved the following amendment: "That in the opinion of the Conference, it is expedient that municipal and other local authorities should undertake the telephone service within the area composed of their own districts or a combination of such districts."

Mr. Boyle (Bedford) seconded the amendment, and said that he had worked out the cost, and found that in Bedford, with 500 subscribers, they could work an exchange for £2 5s. a year, and after five years make a profit of something like £5,000.

Mr. Morton (City) observed that the Post Office officials seemed completely captured by the private company.

The Town Clerk of Liverpool said it was no good talking about having a £3 municipal service if they could not get communication with other places. It was a national question, and they wanted the great commercial houses of the country to be in a position to have a good service. It was playing with the question to say that a few isolated corporations would start a system of their own.

The amendment was lost and the resolution carried.

Mr. Dickinson (L.C.C.) moved: "That as the National Telephone Company obtained its powers and raised its money upon the basis of being subject to actual effective competition, it is just and expedient that steps should be taken to protect the public against the practical monopoly that the company has obtained for itself, and against the inordinate charges that are only leviable by the company by reason of such monopoly."

Mr. Green (Norwich) seconded the motion, and it was carried.

Mr. Baker (L.C.C.) proposed: "That, as one of the causes of the excessive charges is the fact that the company's capital, upon which dividend is paid, has been swelled by the expenditure of large sums of money not represented by any works, it is inequitable that the public should be forced into the position of either having to submit to such charges permanently, or having to buy out the company on the basis of such charges."

This was carried without discussion.

Mr. Benn (L.C.C.) moved: "That seeing that the license of the National Telephone Company will expire in 1911, it is expedient (a) that Parliament should decide that no extension of the license should be granted to the company; (b) that in order that the public may be provided with a telephone service by 1911, the various municipal authorities be granted licenses to establish and work local telephone services prior to that date, and that such licenses shall only be terminable on the payment by the State of the outlay of the undertakings."

Recommendation (a) was agreed to without dissent, but considerable discussion took place on the second recommendation, which was eventually amended so as to provide that any license granted to a municipal authority should give leave to speak over the trunk lines.

On the motion of Mr. Benn, the following resolution was agreed to without discussion:—"That the power of the breaking up of the streets which is claimed on behalf of the National Telephone Company—acting through the Postmaster-General—is a grave interference with the rights of municipal authorities."

It was resolved that the views of the Conference be placed before the Select Committee.

ELECTRIC LIGHTING IN ST. PANCRAS DURING 1897-1898.

An epitome of the work of the Electricity and Public Lighting Committee of St. Pancras Vestry during the year 1897-98 has been prepared and presented to the Vestry by Mr. H. J. Menzies, chairman of the committee. The report is accompanied by a diagram showing both the expenditure and income since 1892, and that for the first time the private lighting income (for 1897) has exceeded the total expenditure by nearly £3,000. The following figures indicate the selling and cost price per unit each year from 1892:—

Year.	Average price realised.	Average cost of production.	Total cost.
	d.	d.	d.
1892	6	4·6	6·88
1893	6	3·5	5·3
1894	5·6	3·2	5
1895	5·3	3·5	5·1
1896	5·4	3·8	5·8
1897	5·2	2·9	4·2

It will be seen from this that last year, whilst by far the most prosperous of the series, realised the lowest average in price, which is, with one exception, the lowest also of any of the Metropolitan supply companies. The alteration in the method of charging, recommended to the Vestry in January, and now further modified, together with the reduction in the charge for public lighting, will probably make the St. Pancras rate the cheapest in London.

Another satisfactory feature is the great diminution in cost. It is interesting to note that in the revised original estimates, on which the Vestry commenced operations, the price per unit was fixed at 2·45 pence works' cost, and ·75 pence for interest and repayment charges. The former figure might have been realised but for the heavy repairs, and probably will be reached immediately; the latter seems altogether too low. Either more was expected of a limited area than it has been found to yield, or money was sunk in unproductive mains: in any case the capital expenditure has involved a heavier burden than ¾d. per unit. It is possible, however, that when the full benefits of the chief engineer's invention of the 220 volts system are obtained, the original figure may not be far exceeded.

Analysis of Costs in Pence per Unit.

—	Coal.	Oil, waste, &c.	Wages.	Maintenance and repairs, including carbon.	Rates.	Management, insurance, law, &c.	Total.
	d.	d.	d.	d.	d.	d.	d.
1892	1·63	·24	1·30	·34	—	1·08	4·60
1893	1·26	·17	·72	·92	—	·43	3·50
1894	·93	·15	·71	·80	·10	·46	3·21
1895	·95	·10	·67	1·18	·10	·49	3·49
1896	·99	·17	·72	1·07	·12	·73	3·80
1897	·84	·09	·63	·92	·09	·33	2·89

The report points out that the coal consumption shows much improvement, but the expenses for maintenance and repairs continue abnormally heavy. The fact is, Mr. Menzies states, that the system is being reconstructed out of revenue, but it is to be hoped the most of the early faults are now removed.

The business, which has more particularly engaged the attention of the Electricity and Public Lighting Committee, has been that of extending the Stanhope Street station. This important step was forced upon the committee by the increasing demand for current, which has so grown that at Christmas much anxiety was felt by Mr. Baynes lest the requirements should be more than the plant could supply. Consumers have come on very fast, especially during the past three years; and as the committee have to anticipate their wants by at least 18 months, their action was not taken a moment too soon, for both stations are already almost fully loaded. The plans of the engineer were of a very comprehensive character, both doubling the capacity of Stanhope Street station and adding greatly to its efficiency; and although some opinion was expressed that a third station should be built elsewhere, the advantages of enlarging the existing one on a site quite ready for use weighed down every other consideration. The new work will probably cost £45,000, but no one who has studied the business can doubt that it will prove a most remunerative outlay. The bulk of the contracts are now placed, and it is much to be hoped such progress may be made that some of the new machinery will be in position for next winter's work.

In addition to the increase of generative power, the decision to carry the mains to Highgate almost completes the arterial system of distribution, all the boundaries of the parish having thus been reached. The extension to Queen's Crescent, Malden Road, and Prince of Wales Road takes up all the remaining important thoroughfares as yet unsupplied with current.

The work of public lighting goes on slowly, but, owing to the precautions imposed last year on the engineer, its early stages are of a difficult and complicated nature. The Gray's Inn Road extension has come into operation, and the Kentish Town Road section is nearing completion. When the Highgate and Malden Road arcs are installed there will be 222 lamps in operation, and it will be the duty to consider by what further action the Vestry can entirely supply itself with the means of street illumination.

Naturally with an increasing revenue and the prospect of a favourable balance, claims have been made for reduction in price. After much consideration the committee adopted the maximum demand indicator as the first step towards fairly effecting this object. There is no doubt that Dr. Hopkinson's method, favoured by the engineer, is theoretically the right one, that every lamp in use should pay a fixed sum towards the standing expenses of the station after which current could be supplied at a slight advance over the cost of coal, labour, and wear and tear of machinery required in its production. But this has many practical difficulties, and to adapt it to a business built up on different lines was a hopeless endeavour. Next in scientific value is the so-called Brighton system, the success of which is shown by its general use for municipal charges. This achieves the same result as is sought by Dr. Hopkinson, and when its application becomes general in St. Pancras on the basis now accepted, it will not only give considerable relief to consumers, but stimulate as well a large extra demand. The vestry is rapidly approaching in its tariff a point when electricity becomes as cheap as gas, and there seems no reason, why in the near future customers whose use of it can average four hours a day during the winter half of the year will be actually paying less.

By direction of the Vestry the committee have had to consider the question of lighting Somers Town, but pressure of business has prevented the engineer preparing his report in sufficient time for decision. This, however, must come up for judgment shortly, either as a special case or as part of a large and general scheme for covering the parish with electrical illumination.

A matter that must not escape notice is the decision of the Home Secretary that the generating stations fall under the operation of the new Workmen's Compensation for Injuries Act coming into operation on July 1st of this year. It will be necessary to make some provision to meet the obligations of this Act, and early action is desirable.

The closing month of the committee's term of office has seen the partial realisation of a hope which originally connected the King's Road station with the dust destructor, that the latter could supply the engines with steam. It cannot be said as yet what is the practical value of this supply, and the investigation Mr. Baynes has been authorised to make must determine to what extent it can be turned to use.

ELECTRICAL ENGINEERS (R.E.) VOLUNTEERS.

It will be seen from the annexed rules that the War Office have made an important change in the regulations for efficiency of the Electrical Engineers Volunteers. By the regulations originally proposed, recruits were required, in addition to military drills and eight days' training in camp, to attend 78 technical drills. By the modified regulations the 78 technical drills are reduced to 12. Whilst this will make the work of recruits living in London much easier, it will also make it quite practicable for men residing at a distance from London to join the corps, they will obtain their purely military training with any volunteer corps in their own neighbourhood, and will complete their technical training by attending in camp two additional days, making, with the eight days' training required from all, a total of 10 days. No doubt these altered conditions will conduce very materially to the greater success of the corps. The rules are now as follows:—

The headquarters of the corps are at 13, Victoria Street, Westminster.

The uniform will be the same as that worn by other Royal Engineer Volunteers, with such modifications as the War Office approve. Uniform will be supplied free to members.

The corps will be armed with the Lee-Metford rifle.

The training is divided into two kinds—military and technical.

The military work consists of infantry drills, musketry, &c.

The technical work includes every application of electricity to war, with the exception of telegraphy, and such other work as will be useful to an electrician or engine-driver in carrying out his duties, such as signalling; fitting, loading, priming, and connecting up submarine mines; a certain amount of boat work, and knotting, splicing, &c.

This work will be carried out partly in London, but mainly at defended ports.

In order to become efficient, each member must attend a continuous training at a defended port for at least eight days each year. In addition, 12 hours' technical work must be done each year. For this purpose, each working day—after the first eight—of the continuous training counts as six hours; each half-day four hours. Or, these drills may be done in periods of 1, 1½, 2, 2½, 3, and 3½ hours.

The capitation allowance is £4.

For each of the eight days of the continuous training, an allowance of 5s. per member in camp is paid to the corps. The allowance will be primarily devoted to the maintenance in camp.

Drills—both military and technical—are being carried out in London and Woolwich at present.

Members from other districts will only be permitted to join on undertaking to make private arrangements to learn their infantry drill.

Intending members are requested to study the conditions of efficiency.

Below will be found an extract from the rules of the corps:—

5. Every enrolled member who is non-efficient in any year shall pay to the funds of the corps, on or before November 10th in that year, a sum equal to the Government capitation allowance which he failed to earn. . . . . The commanding officer shall have power to remit payment, wholly or in part, in special cases.

8. No person shall be admitted as member or honorary member unless proposed by one or more members of the corps, and approved by the commanding officer.

24. Any member wishing to leave the corps may do so on November 2nd, providing he shall have given notice of his intention not later than the 30th of the preceding September. Failure to comply with this rule shall render him liable for half the amount of the succeeding year's capitation grant.

Note.—Age limit 17 to 47 years.

Intending members should write to the adjutant, Captain Brady, R.E., 13, Victoria Street, S.W., who will supply all information. They should give their full name, address, occupation, and electrical qualifications. If they wish to join as engine drivers, they should state their qualifications for that work.

Every application must be accompanied by a reference to a member of the corps or to some other person well known to the commanding officer.

Before enrolment, each candidate must be passed as fit by a medical officer.

Every member shall be enrolled for three years at least. A member leaving before completing three trainings shall be liable to a penalty of £2 10s.

Note.—The headquarters are open on week days from 10 to 4, Saturdays from 10 to 12. On Mondays and Thursdays at 8 p.m. in addition.

J. Hopkinson, F.R.S., Major,
Commanding the Electrical Engineers, R.E. (Volunteers).

REVIEWS.

A Treatise on Magnetism and Electricity. By Andrew Gray, LL.D., F.R.S. London: Macmillan & Co., Limited.

Messrs. Macmillan have sent to us the first volume of this work by Prof. A. Gray. It is pleasant to recognise the learning and scholarship of the author in such a handsome material form. The matter of the book, so far as this volume goes, is arranged in the logical order suggested by modern conceptions of magnetism, and though possessing no originality in matter or treatment, is the most philosophical connected statement of these conceptions we have seen. The production of this work is creditable to the author, and to the distinguished school of physicists that trained him. The book is beautifully printed and got up, and will no doubt find a place on the shelves of all mathematical physicists. We could wish the author had the courage of his convictions in the matter of the Heavisidal units. The magnetic pole is now to everyone the source of magnetic flux, only secondarily the centre of magnetic force, and we do not believe the adoption of the corresponding definition would cause any confusion through our use in practice of the ampere and the ohm. Probably 19 out of 20 electricians are more or less agreed about this, and not 1 in 20 will act on the consensus. Prof. Gray's preface shows that he is, as every teacher must be, alive to the philosophical value of a change. The defect of the book, if it is a defect, is its very close following of Lord Kelvin in subject and mode of demonstration, but it seems that the time cannot be distant when a satisfactory hypothesis for the conditions of the ether will be devised, and all electrical phenomena will be deducible from the laws of these conditions. Then the books can be re-written on an exact basis, and the work of the great physicists built into a perfect structure. May we be there to see!

The Standard Electrical Dictionary. By T. O'Conor Sloane, A.M., E.M., Ph.D. London: Crosby Lockwood and Son.

This dictionary of electrical terms is not only a useful work for present reference, but promises to be of great interest in the future. Electricity is the mother of a great family of new ideas, new terms, and new inventions. Many of these are already obsolete, and others continually become so, and a book which condenses into a small space short statements and illustrations of all the terms in use at any given date is of great value: and this small volume contains all sorts of electrical terms, some scientific, some slang, that one ever meets. It is not very serious lexicography, nor are the definitions too precise, and except in a few cases of conspicuous difficulty, *e.g.*, induction, and resistance, the treatment is very terse; but for the object of the book this is undoubtedly a merit. To a non-expert electrician the book would be useful and interesting; for a professional man the matter is hardly exact enough to be very valuable.

Practical Telephony. By JAMES BELL, A.I.E.E., and S. WILSON. London: *Electricity*, 11, Ludgate Hill, E.C.

This is a republication in book form (with additions) of a series of articles which appeared in the pages of our contemporary *Electricity*. It describes—much after the manner of earlier works—various types of telephonic instruments. It is perhaps chiefly valuable for its description of the apparatus now used by the Post Office, and also for domestic apparatus. Exchange working generally is somewhat beyond its scope. The authors believe that "there is room for a simple telephone manual at a moderate price," and two shillings and sixpence will doubtless be considered as coming within the lines of moderation.

A Popular Guide to Commercial and Domestic Telephony. By M. BYNG, M.I.E.E., and F. G. BELL. London: The General Electric Co., and Whittaker & Co., 2, White Hart Street, Paternoster Square.

This work mainly deals with apparatus furnished by the firm whose name is given as joint publishers. Its object is "to assist the fitter to obtain some knowledge of the telephone, both theoretically and practically," and, being written from the standpoint of the non-expert, it covers much elementary ground. Some of its statements may be open to question, as for example, the origin suggested for the discovery of the microphone on page 16, but the main object of the work is descriptive of apparatus which is, on the whole, well done. It may perhaps be doubted if the non-expert, for whom the work is intended, will make much of the instructions for discovering faults on page 142. The work is well printed and furnished with good blocks and clear diagrams.

First Stage Magnetism and Electricity. By R. H. JUDE, M.A., D.Sc. University Correspondence College Press. London: W. B. Clive, 13, Booksellers' Row, Strand, W.C.

The book is intended primarily to cover the syllabus of the elementary stage of the Science and Art Department. The author admits that there are already a number of books in existence written for the same subject, but he argues that none of them present the subject of *electrical potential* clearly to the student. Whether the failure to make this particular point clear is a sufficient justification for the issue of a new book dealing with the whole general subjects of electricity and magnetism, may be doubted. We cannot, however, find fault with Mr. Jude's production nor his attempt to compete with others who may have written books equally good and of equal utility with his own. With the exception of the particular point (certainly an important one) with reference to electric potential there is but little originality in the work; it is, however, perfectly sound and can, therefore, be safely and profitably used for the purpose intended.

NEW PATENTS.—1898.

Compiled expressly for this journal by*. W. P. THOMPSON & Co., *Electrical Patent Agents*, 322, *High Holborn, London, W.C., to whom all inquiries should be addressed.

10,535. "Improved method of winding armatures of dynamo-electric generators or motors." W. R. V. MARSHALL and PATERSON, COOPER & Co. Dated May 9th.

10,557. "Improvements in and relating to electric furnaces." T. JACKSON. Dated May 9th. (*Complete.*)

10,585. "Improvements in electric resistances." W. P. THOMPSON. (The Chemisch Elektrische Fabrik "Prometheus" Gesellschaft mit beschrankter Haftung, Germany.) Dated May 9th. (*Complete.*)

10,599. "Improvements in electrical devices for igniting liquid burners." THE REFORM PETROLEUM BELEUCHTUNG, GESELLSCHAFT M. B. HAFTUNG and E. WEINHAGEN. Dated May 9th. (*Complete.*)

10,606. "An electric signal bell for cycles." S. KRAUS. Dated May 9th. (*Complete.*)

10,608. "Improvements in electrically illuminated buoys." H. H. LAKE. (P. C. F. Hoffman, Germany.) Dated May 9th.

10,611. "Improvements in electric primers for firing guns." C. A. MCEVOY. Dated May 9th.

10,615. "Improvements in automatic apparatus for receiving the charges for telephone conversations and telegrams." L. M. ERICSSON and S. RITTER. Dated May 9th. (*Complete.*)

10,616. "Improvements in enclosed arc lamps." G. T. DAVIES. Dated May 9th.

10,617. "A controlling switch for large numbers of electric circuits." H. K. SMITH and J. ECK. Dated May 9th.

10,618. "An improved indicating and recording apparatus for use in connection with electric meters." G. C. PILLINGER. Dated May 10th.

10,647. "Improvements in electric incandescent lamps." W. J. PHELPS. Dated May 10th. (*Complete.*)

10,650. "Improvements in and relating to electric arc lamps." F. A. GILBERT and E. O. LUNDIN. Dated May 10th. (*Complete.*)

10,652. "Improvements in electric condensers." C. S. BRADLEY. Dated May 10th. (*Complete.*)

10,690. "Improvements in starting devices for single-phase alternating electric current motors." THE BRITISH THOMSON-HOUSTON COMPANY, LIMITED. (J. P. Stone and S. E. Doone, United States.) Dated May 10th. (*Complete.*)

10,705. "Improvements in electric motors and meters adapted for use with alternating currents." H. P. DAVIS and F. CONRAD. Dated May 10th. (Date applied for under Patents, &c., Act, 1883, Sec. 103, October 22nd, 1897, being date of application in United States.)

10,805. "Improvements in primary batteries." F. H. PERRY. Dated May 11th.

10,808. "Improvements in Morse telegraph apparatus." SIEMENS BROS. & Co., LIMITED. (A. Tribelhorn, Argentine Republic.) Dated May 11th. (*Complete.*)

10,816. "An electrical two-way pear or pressel switch." J. W HINTZL. Dated May 11th.

10,818. "Improvements in electricity meters." G. HOOKHAM. Dated May 11th.

10,821. "Improvements in the manufacture of electro-plate." S. COWPER COLES. Dated May 12th.

10,848. "Improvements in dynamo-electric machines and motors." S. G. BROWN. Dated May 12th.

10,869. "Improvements in electrical clocks." A. GRIFFITHS. Dated May 12th.

10,883. "Apparatus for transmitting motion to a distance by means of electrical energy." SIEMENS BROS. & Co., LIMITED. (Siemens & Halske, Acktien-Gesellschaft, Germany.) Dated May 12th. (*Complete.*)

10,900. "Improvements in electric arc lamps." W. L. WISE. (J. H. Hubbell, United States.) Dated May 12th. (*Complete.*)

10,901. "Improved system of vacuum tube lighting and apparatus for use therein." W. L. WISE. (The Moore Electrical Company, United States.) Dated May 12th. (*Complete.*)

10,922. "An improved switch for electric motors." A. E. TANNER and F. A. C. LEIGH. Dated May 13th.

10,941. "Improvements in conduits for electric railway and tramway traction." E. C. HORGERSTAEDT. Dated May 13th.

10,942. "Improvements in electro-magnetically operated switches for strong electric currents." E. C. HORGERSTAEDT. Dated May 13th.

10,960. "Improvements in electrical storage batteries or accumulators." J. B. SCAMMELL. Dated May 13th.

10,979. "Improvements in and in the production of glass globes, chimneys, lenses, and such like, for electrical, gas, and oil illumination." H. CRUDGINGTON, W. CRUDGINGTON, and W. R. RIDINGS. Dated May 18th.

11,044. "Process and apparatus for covering metallic wires with asbestos for insulating and other purposes." E. ALBASINI. Dated May 14th. (Date applied for under Patents, &c., Act, 1883, Sec. 103, December 3rd, 1897, being date of application in Italy.) (*Complete.*)

11,051. "Improvements in apparatus for use in the electro-deposition of zinc or other metals." THE COWPER-COLES GALVANISING SYNDICATE, LIMITED, and S. O. COWPER-COLES. Dated May 14th.

11,068. "Improvements in the production of zinc and sulphate of copper by electrolysis." H. H. LAKE. (A. Lotti, Italy.) Dated May 14th.

11,075. "Improvements in apparatus for vacuum tube lighting." W. L. WISE. (The Moore Electrical Company, United States). Dated May 14th. (*Complete.*)

11,076. "Improvements in and relating to telephone installations." E. BAIVY. Dated May 14th.

THE
ELECTRICAL REVIEW.

VOL. XLII. JUNE 3, 1898. No. 1,071.

CONTENTS:

THE ELECTRICAL REVIEW.
Published every FRIDAY, Price 4d.
The Oldest Weekly Electrical Paper. Established 1872.
TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.
OFFICE:—4, LUDGATE HILL, LONDON.
Telegraphic Address: "AGERKAY, LONDON." Code A B C.
Telephone No. 988 Holborn.
ALL Letters should be addressed to the Proprietors, H. Alabaster, Gatehouse & Co.
ADVERTISEMENT RATES ON APPLICATION.
The "Electrical Review" is the recognised medium of the Electrical Trades.

SUBSCRIPTION RATES.—In *Great Britain*, Post Free per Year, 19s. 6d. To all *other countries*, per Year, £1 4s.

BINDING.—Subscribers' numbers bound, including case, for 4s. each volume.

CASES.—Cloth Cases for Binding can be had, price 2s. 6d. each.

READING CASES, to hold from One to Twenty-six Numbers until the Volume is complete for Binding, can now be had from the Publishers, Price 6s. or Free by Post (in Great Britain), 6s. 6d.

FOREIGN AGENTS.—*New York:* D. VAN NOSTRAND, 23, Murray Street. *Paris:* VEUVE J. BOYVEAU, 22, Rue de la Banque. *Berlin:* ASHER & Co., 5, Unter den Linden.

Cheques and Postal Orders (on Chief Office, London) to be made payable to Mr. H. ALABASTER, 4 Ludgate Hill E.C.

LOAD FACTOR.

THE question of what is the best definition of the term load factor has recently been brought into prominence as the result of the divergence of opinion shown to exist amongst speakers in the discussion on Mr. Hammond's paper "On the Cost of Generation and Distribution of Electrical Energy;" and, in consequence of this want of accord amongst electrical engineers, Mr. Hammond, in a letter which appeared recently in the columns of a contemporary, has explained his own views more fully than he was able to do when replying to the discussion on his paper, and has invited discussion with a view of settling once for all the definition of the term "load factor." In this letter Mr. Hammond claims that a complete agreement was come to as to the definition of this term in the discussion on Mr. Crompton's paper, which was read in 1891 at the Institution of Civil Engineers, and in which the term load factor was first employed; and although we must confess that the discussion itself did not evidence a complete agreement, yet the final definition given by the author of the paper in his reply to the discussion is the one which has been almost universally adopted; and, when any one has spoken of the load factor, it has been understood to mean the ratio of the actual units generated during the year to the product of the maximum output in kilowatts at any time during the year into the total number of hours in the year.

Although the above definition is, we believe, the generally accepted one, yet the term is often used, sometimes with and sometimes without qualification, to express other ratios than the one named above; the reason being that there are a number of factors all of the nature of load factors which influence the total cost of a unit of electricity, and that sometimes one and sometimes another of these factors is the most important in its effect according to the particular point which is being examined. Take, for instance, the load factor to which Mr. Hammond takes objection, and which is based on plant capacity, we can find three different definitions, each of which has its special utility. If the denominator of the ratio is the maximum plant capacity multiplied by the number of hours, we have a factor which has a decided effect on the financial results; since, if the plant is of greater capacity than is necessary, capital is lying idle, and interest has to be paid on plant which has no earning power. Again, if the maximum capacity of the plant in use at the time of greatest demand appears in the denominator, the factor so obtained has a great effect on the coal consumption and evaporative efficiency of the boilers, and also on the labour bill; and this factor is extremely useful in comparing the results of one week with another, or one month with another. The third factor is one in which the denominator expresses the sum of the products of maximum output of each engine and dynamo into the number of hours it has been in service, and this factor, which gives the ratio of the actual average output of each steam plant during running hours to its maximum output, is the one which affects the steam consumption per unit.

Another factor which affects the financial results may be termed the lamp-hour load factor, and is obtained by making the denominator equal to the product of the output required for the total lamps connected into the number of hours, and this is useful as a basis of comparison of the earning power of the distributing plant. Although all these factors have their utility, we do not think that any of them have a claim to be called "the load factor," as compared with the one based on maximum output, unless it be the factor based on the maximum capacity of the plant in use at the time of greatest demand. This latter factor, we consider, gives a truer basis of comparison for works' cost than any other, if the load factor for the year is calculated by taking the average of the daily or weekly load factors. For example, the load factor each day will be the ratio of the number of units generated to the capacity in kilowatts of the plant in use at the time of greatest demand multiplied by 24, or for each week the similar ratio with a multiplier of 168 instead of 24; and the load factor for the year will be the average of the 365 daily or the 52 weekly load factors.

This averaging of daily or weekly load factors, whether they are based on maximum units generated or maximum plant capacity in use at the time of greatest demand, gives a factor for the year which is much more useful than one based on the absolute maximum at any time during the year; and of the two ways of calculating the daily or weekly load factor, we consider that the one which depends on plant capacity is the more useful. This averaging is advantageous, not only for the reason given by Mr. Hammond that it takes into account the fact that the lamp connections are continually increasing in number, but because it takes into account the variations of the daily load curve at the different seasons of the year; and these variations are equally important, whether the number of lamps connected has doubled in the 12 months, or has remained stationary. For example, if we take two districts, in one of which the demand is very largely for the lighting of residential and other buildings which require to be fully lighted for a certain time every evening throughout the year, whilst in the other the demand is chiefly for the lighting of shops which close early enough not to require any artificial light during the summer months; we may get equal load factors if we calculate on the absolute maximum demand or capacity of plant in service; and yet the shop district, which would give the higher load factor calculated by averaging the daily or weekly factors, would be the cheaper district to supply as far as generating costs are concerned, because in the summer months a smaller number of boilers would have to be lighted and fewer engines run than for the residential district.

In conclusion, we would remind our readers that, whatever definition is adopted for "the load factor," it will at best be a sort of compromise, as no one factor can be found which will form an accurate basis of comparison between two supply undertakings; and, that if it be desired to compare the conditions of working of two undertakings, all the other factors that we have mentioned, and possibly others that have not been referred to, must be taken into account, whether they be called load factors or by any other name.

The Inconveniences of Acetylene.—We have frequently argued that whatever results are obtained on a small scale in laboratory working with such a thing as an illuminant should not be given to the world as absolute, or as illustrative of that which will attain in practice, and we are interested to notice that our position is fully confirmed in the case of acetylene by the numerous experiments which have been made since this gas came into prominence. In Hungary, at the town of Veszprim, Josef Vértess has been studying the use of acetylene on a large scale at the central station there, and we should like to suggest that it is desirable, for those who are endeavouring to bring this gas into general use, to consider carefully the experiences recorded by Vértess in a paper which may be found in the *Chemiker Zeitung*, Vol. 21, page 174. The paper does not betray any bias, and, indeed, does not go nearly so far as might have been expected, considering the opportunities which exist at Veszprim for an exhaustive examination of the whole subject. However, Vértess has succeeded in recognising a number of inconveniences at present attaching to the use of acetylene in practice, and these may be summed up in the following abstract of his paper:—"The carbide generally contains uncombined carbon, which is carried in the form of fine dust into the pipes, and with the water of condensation forms obstructions in them. In theory, 1,000 grammes of carbide should yield 360 litres of acetylene; the Continental works guarantee only 300, and practice shows that 280—290 is the general yield. Besides free carbon, the carbide contains metallic compounds of sulphur, phosphorous, and nitrogen, and consequently the acetylene evolved contains H_2S, phosphuretted hydrogen and ammonia, the impurities reaching 3—4 per cent. Acetylene ought to be purified in the same way as coal gas, and until that is realised it cannot make much progress as an illuminating agent. The burning of unpurified acetylene in closed rooms is dangerous to health, the most dangerous impurity being phosphuretted hydrogen. There is no doubt that some of the so-called spontaneous explosions have been caused by the ignition of this gas at the temperature existing in the generator. The worst inconvenience of acetylene is the 'smoking of the flame.' The best burners are those with 10—12 small flames, as each flame has a separate atmosphere; even with these, smoking sets in after 200—300 hours' burning. The cause is the decomposition of the acetylene by the heat of the burner; the carbon deposits in the narrow opening of the burner and the flame begins to smoke. Sometimes an oily liquid is formed in the burner, probably a hydrocarbon formed by polymerisation of the acetylene." In conclusion, Vértess says that a very great deal more work must be done before the defects specified in lighting by acetylene can be overcome, and he contents himself by the opinion that it is *absurd* to attempt to produce acetylene for general lighting purposes until the problem of properly purifying it has been overcome.

The Magnetic Properties of Nickel Steel.—Numerous researches have been made on this subject and a good deal of knowledge accumulated, but there is still much to do in checking the results and a great deal more to be done in obtaining further information. Recently E. Dumont has contributed a paper to the Paris Academy of Sciences on this subject (*vide Comptes Rendus*, Vol. 126, pages 741—744.) Dumont has determined the magnetic permeability for fields lying between 14 and 50 C.G.S. units, and for temperatures between — 78° and 250° C., of reversible nickel steels, containing from 27 to 44 per cent. of nickel. The variations of permeability with temperature in the maximum field are continuous, and the curves representing them are roughly parallel to each other, so that at equal distances (of temperature) from the point of total loss of magnetism, all the alloys have the same permeability. At a temperature of 20°, all the alloys show similar changes of permeability, with variations in the magnetising field, rising slowly as the field is strengthened from 14 to 25 units, then rapidly increasing to a maximum in a field of 35 units, and slowly diminishing as the strength of the field is further increased. Under the same circumstances of temperature and strength of field, the permeability increases with the content of nickel.

VIBRATING CABLE RELAY.

By K. GULSTAD.

What to be done in order to produce a suitable cable "relay" is a question which no doubt has troubled the minds of many telegraph people. It is certainly not less interesting at the present time, when the demand for increasing the working speed of submarine cables to their utmost capacity has necessitated the introduction of automatic transmitters on the busiest lines.

With the exception of some ingenious proposals by Mr. Ch. Cuttriss and others—*vide* the Review, July, 1892—in reference to the reversal system, I am, however, not aware that anything worth mentioning has been published about cable relays since the appearance of the Brown & Allan relay, an instrument which is probably still looked upon as the only veritable cable relay, and which deserves this name, from its being able to act under the influence of varying current strengths, independent of the direction of the current.

It is at the same time hardly necessary to point out that the Brown & Allan relay does not possess all the qualities required for working at high speed, and as an essential point, I may mention that it is unable to give reliable contacts unless its sensibility be sacrificed.

A cable relay, like the Brown and Allan instrument adapted for Morse code signalling, and more especially for automatic working, may, however, be made in quite another way, as described hereafter, which I trust will not prove uninteresting to some of the readers of the Review. The cable relay I refer to is not in principle of any particular construction. Any polarised double current relay may, generally speaking, be used and made into a cable relay, not by way of altered construction, but simply through a special arrangement.

The failure of the polarised relay, when employed as a cable relay in the usual manner, is partly due to want of sensitiveness, but principally to its being unable to respond to variation of currents in one direction only. It is understood that the want of sensitiveness *à priori* is caused by the magnetic attraction between the armature and the nearest pole-piece, a circumstance that gives to the relay its most sensitive state when the pole-pieces are removed to some distance from the armature, although the action of the current through the relay is considerably diminished thereby.

Now this attraction can be done away with, or rather converted into a repulsion independent of the relative position of the pole-pieces. Of course, a relay freed from the attraction would be very sensitive, and it would also respond better to variation of the current than before. In figs. 1, 2, 3, a cable signal through a relay is represented. Let a be the zero line, and let further the dotted lines m and n, fig. 1, signify the current requisite to overcome the said attraction. As indicated by Morse signals on the sketch, the relay would record the received signal in different ways, according to whether the attraction is neutralised or not, as in fig. 2 and fig. 1 respectively, the effect of distortion in the former case being at least somewhat less.

Fig 1 Fig 2 Fig 3

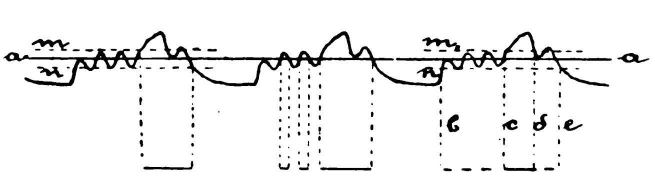

Fig. 3 shows a still better result, and refers to a case of repulsion, or to that particular point which I am going to deal with here. This repulsion of the armature is achieved by arranging the relay as an interrupter in some particular manner, which will make the armature vibrate at a certain rate between the contacts, if the interrupting current be made sufficiently strong. In fig. 3 this rate is supposed to be equal to that of dots sent into the cable; if m_1 and n_1 here represent the current required to stop the vibrations, the relay will accordingly record 3 dots between b c and 1 dot between d e—*i.e.*, the Morse signal as shown.

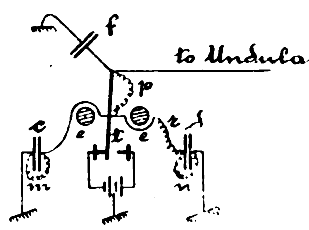
By thus employing a vibrating relay the effect of distortion is reduced—a most valuable achievement—and all the energy required to move the armature is supplied by the relay current itself, the work left for the cable current being to stop the motion when wanted. This work can be made very small indeed, and means in reality that the relay becomes exceedingly sensitive. One thing is, however, needed, namely, that the vibrations of the tongue can be "tuned," and this being a matter of importance, I propose to treat of it more particularly.

Experiment will show that the plain arrangement of an interrupter will not do when a polarised relay is to be altered into a double current interrupter of required qualities, as the relay might not vibrate at all, or at too high a rate, and too irregularly to be of any use—see fig. 4, where the relay is shown, t being the tongue, e the electro-magnets.

This occurs because the attraction cannot be converted into a repulsion of sufficient strength to make the armature or torque vibrate between the contacts, unless the current be made so strong, that the rate of vibrations at the same time becomes disproportionately high. If the current be reduced by increasing the resistance, p, in order to get vibrations of a lower rate, the armature may be moved, but only very little indeed, until the contact is broken and the interrupting current ceases to flow; the attraction will then again predominate, viz., the vibrations take place very close to one of the contacts, but not from the one to the other.

Fig 6



In order to overcome this difficulty, I retard the propagation of the interrupting current by applying an inductive capacity, c. Fig. 5, for instance, at point o, in connection with the resistance, r, a little time will pass before the potential at o is raised sufficiently to enable the current to overcome the attraction, but when this is accomplished and the contact broken, the armature will not fall back, but continue its motion from one contact to the other with appreciable energy, due to the fact that the condenser, c, is now partly discharged through the windings and r.

By utilising this principle it is possible to make a relay vibrate at a slow rate, but some alterations of, and additions to, the arrangement will nevertheless be found advantageous or necessary to enable the rate to be varied at pleasure.

Fig 4

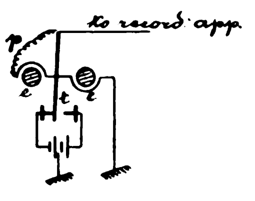


Fig 5

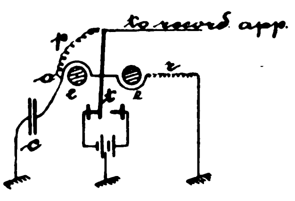


An appropriate arrangement is sketched out in fig. 6. c, d, f are condensers; n, p resistances; m a large and r a rather small resistance. The relay is differentially wound in the usual manner.

The resistance, p, is put between the tongue and some other point of the circuit than before, say, at the middle of the convolutions. By charging the conductor, c, the tongue is at first pressed against one of the contacts, whence it is removed shortly after. Good contacts are thus fully ensured.

One particular object of the condenser, d, will be evident from the following:—Suffice it here to say that the reversals for high speeds are produced by the difference in charges of c and d, that d increases the rate of vibrations, at the same time somewhat mitigating the rattle of the apparatus, and that d must be shunted by a resistance n, for otherwise the tongue will not vibrate, or, at least, not steadily. The condenser, f, is inserted to avoid or make up for other causes of trouble, viz., the sparking between the contact points, minute mechanical vibrations, &c., in virtue of the condenser maintaining the electrical potential of the tongue for a little while, when it moves from one of the contacts.

With suitable condensers the relay, arranged as described, can be made to vibrate practically at any pitch—by varying the resistances, &c.—with beautiful regularity, as will be observed from the relay records, fig. 7, on the slip of an "undulator," a recording instrument described in the REVIEW, January 29th, 1892, page 130.

Fig 7

Fig 8

Fig 9

Such vibrations give an interesting illustration of the retarding effect accompanying the charge of condensers combined with resistances and effect, which for large condensers, *c*, and cables can be extended to such a degree that the armature only is reversed once every half second or more. Under certain conditions irregular vibrations can also be had—see record fig. 8—for instance, when the direct action of the resistance, *n*, is about to be overpowered by the action of the condenser, *d*, or *vice versâ*.

In some instances the different action of the condenser and resistance can be produced instantly, without any period of transition—see record fig. 9—causing the rate of vibrations to be changed suddenly.

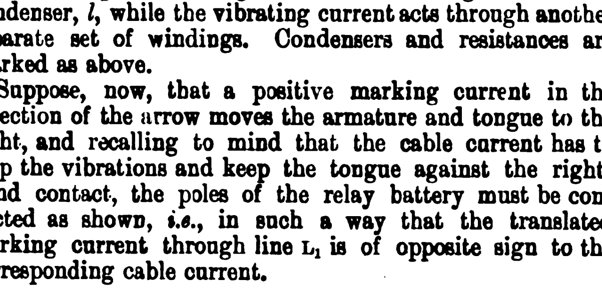
A curious thing can be observed in connection herewith, namely, that the tongue is able to vibrate at two different rates under the same conditions, although the vibrations are stable for one rate only.

This shows that the vibrations or the condenser oscillations keep their pitch at any moment with a persistence that can only be overcome by a certain force. In fig. 9 the different rate of vibrations is not produced by altering the connections, but by slightly tapping the base of the apparatus.

In the regulations to be described later on, one must, of course, not make any connections, which tend to cause such irregular vibrations.

The application of the vibrating relay for working can be effected as shown in fig. 10, L being line or cable, whence

Fig 10



the current passes through one set of windings to the cable condenser, *l*, while the vibrating current acts through another separate set of windings. Condensers and resistances are marked as above.

Suppose, now, that a positive marking current in the direction of the arrow moves the armature and tongue to the right, and recalling to mind that the cable current has to stop the vibrations and keep the tongue against the right-hand contact, the poles of the relay battery must be connected as shown, *i.e.*, in such a way that the translated marking current through line L_1 is of opposite sign to the corresponding cable current.

(*To be continued.*)

CATHODE RAYS IN AN OSCILLATING ELECTRIC FIELD.

THE theory of the cathode rays most in favour among physicists in this country is that which assumes that the rays consist of a stream of particles charged with electricity. This theory has not been generally accepted in Germany, though recently it has made a few converts.

One apparently fatal objection urged against the view that the cathode rays consist of charged particles, is that they are not deflected by an electrostatic force. If these rays consist of electrified particles, one would expect *primâ facie* that they would be more susceptible to an electrostatic force than to a magnetic force. The reverse, however, is the case. They can be readily deflected by a comparatively weak magnet; but Hertz found that no deflection was produced when the rays passed between two plates connected to a battery.

Prof. J. J. Thomson makes an ingenious attempt to explain away this anomaly in the charged particle theory. He says: * "We must remember, however, that the cathode rays, when they pass through a gas, make it a conductor, so that the gas acting like a conductor, screens off the electric force from the charged particle, and when the plates are immersed in the gas, and a definite potential difference established between the plates, the conductivity of the gas close to the cathode rays is probably enormously greater than the average conductivity of the gas between the plates, and the potential gradient on the cathode rays is probably very small compared with the average potential gradient" He also describes an experiment in which a deflection can be produced when the electrostatic field is caused to act on the dark space next the cathode, and this he explains by the hypothesis that the gas in the dark space is either not a conductor at all, or, if a conductor, a poor one, compared with the gas in the main body of the tube.

An interesting experiment is described by J. J. Thomson, which illustrates this curious resistance of the dark space to the passage of the cathode rays. Two spherical bulbs were connected together by a glass tube; one of these bulbs was small, the other large; they each contained a cathode, and the pressure of the gas was such that the dark space round the cathode in the small bulb completely filled the bulb, while that round the one in the larger bulb did not extend to the walls of the bulb. The two bulbs were wound with a wire which connected the outsides of two Leyden jars; the insides of these jars were connected with the terminals of a Wimshurst machine. When sparks passed between these terminals, currents passed through the wires and induced currents in the bulbs, which caused a ring discharge to pass through them. Things were so arranged that the ring was faint in the larger bulb and bright in the smaller one. On making, however, the wires in these bulbs cathodes, the discharge in the small bulb, which was filled by the dark space, was completely stopped, while that in the larger one became brighter. Prof. Ebert has also shown that a cathode stream is deflected out of its straight path by creating a dark space in its way.

The charged particle theory gives no satisfactory explanation of this curious property of the dark space; and though some ingenious experiments, similar to that of Perrin, have been devised by J. J. Thomson to show that the cathode rays discharge negative electricity on anticathode conductors, yet, while so many important phenomena remain inexplicable by this theory, it appears advisable, for the present, to suspend our judgment.

Jauman also obtained a deflection of the cathode rays by placing a conductor close to the side of the tube just in front of the cathode. But this has been shown by Schmidt and Wiedemann † to be due to a displacement of the starting point of the cathode rays owing to the change produced in the electric field by the presence of the charged conductor, and not to a deflecting influence exerted on the cathode rays by the electrostatic field. The deflection obtained by J. J. Thomson may be explicable in the same way, since the conditions of his experiment were very similar to those of Jauman.

Though it is still doubtful whether the stationary electric

† E. Wiedemann & G. C. Schmidt, *Wied. Ann.*, 60, p. 510, 1897.

field produces any deflection of the cathode stream, it has been recently shown by Schmidt * that unmistakable deflections are produced by an oscillating electric field. The conditions of the experiments made by Schmidt exclude the possibility of the deflections being due to a displacement of the starting place of the cathode rays.

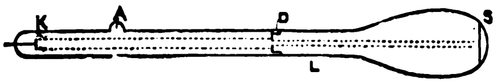

Fig. 1.

Schmidt's experiments were made with a special vacuum tube designed by Braun.† In this tube, illustrated in fig. 1, K is the cathode disc, and A is the anode. At D is an aluminium diaphragm with a central aperture about 2 mm. in diameter; S is a disc of mica coated with phosphorescent material, on which the phosphorescent spot can be seen through the glass when looking at the end of the tube.

If an insulated metal plate is brought near the tube in the neighbourhood of L, the phosphorescent spot widens out a little. This phenomenon is intensified if the plate or, in its place, a brass ball is connected to the cathode pole of the induction coil. Under these circumstances a comet-like tail is thrown out from the side of the spot opposite to the inducing body. The appearance of some of these comet tails is shown in fig. 2.

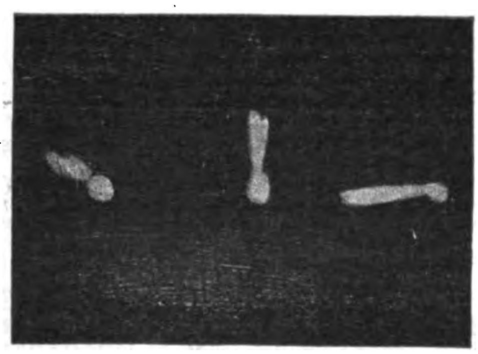

Fig. 2.

Since the publication of Schmidt's experiments, this subject has been taken up and thoroughly investigated by Prof. Ebert, of Kiel.‡ Instead of the induction coil, Ebert used a small alternating dynamo driven at the highest possible speed by an electro-motor. This machine generated an alternating current with a frequency of 60,000 per minute. The E.M.F. of this current was raised by a Siemens spark inductor with the condenser removed to 1,500 volts. The terminals of the secondary of this coil were connected to a pair of condenser plates placed at opposite sides of the Braun tube close behind the diaphragm. The cathode rays in the tube were produced by an influence machine. Ebert's arrangement, therefore, differs from Schmidt's in several features. (1) With Ebert's apparatus the oscillating electric field is persistent and regular, while in the Schmidt arrangement it is irregular and quickly damped, owing to the oscillations being derived from the ordinary induction coil. (2) The source of the oscillating field is independent of the source of the cathode rays in Ebert's arrangement, while in Schmidt's they are both derived from the same source, viz., the secondary of an induction coil.

Ebert satisfied himself, by experiment, that the time changes of the electric field between the condenser plates were almost perfectly sinusoidal, and followed one another without a break. With this apparatus were obtained not only comet-tail extensions of the nucleus spot on the phosphorescent screen, but well defined deflected rays could be seen, which, in the rotating mirror, were drawn out into oscillation curves of the greatest regularity.

† *Wied. Ann.*, Vol. 60, p. 552.

‡ *Wied. Ann.* 64, p. 240, 1898.

The two metal plates, P_1 P_2, fig. 3, having each a surface of 8·7 × 6·8 cm., were formed into a small condenser by fixing them at one end to a block of vulcanite, S_2, 2·5 cm. thick. These plates projected far enough over the vulcanite to embrace the tube, B. When the machine was started, the spot on the phosphorescent screen was drawn out into a thick vertical band of about 3 cm. in length. This experiment, therefore, proves that in the oscillating electric field cathode rays are distinctly deflected, and always in the direction of the lines of force, the latter assertion being easily demonstrated by turning round the condenser. The deflection in this case cannot be explained on the theory of the displacement of the starting point of the cathode rays, since that was 30 cm. distant from the condenser plates, and it was found that these plates lost their deflecting power if they were moved away from the tube even a few centimetres. The deflection is greater the greater the surface of the plates, and it also increases if the condenser is moved towards the end of the tube, as if the amplitude depended on the leverage at which the condenser acted. The deflection also increases with the potential difference between the plates.

Ebert suggests three different theories to explain this deflection effect of the oscillating electric field, and then proceeds to examine these theories by crucial experiments to determine which gives the correct explanation. He considers it possible that the deflection may be due to :—

I.—The magnetic effect of the displacement currents in the dielectric.

II.—The electrostatic charges on the walls of the vacuum tube.

III.—The deflection effects of secondary cathode phenomena.

I.—The Influence of the Displacement Currents.

The displacement currents of Maxwell's theory oscillate backwards and forwards along the electrostatic tubes of force, and would consequently give rise to circular magnetic lines of force surrounding each tube. These magnetic circles are equivalent, according to Stokes's theorem, to a shell of rectangular magnetic lines of force lying in the planes joining the edges as the condenser plates. The magnetic effect of these lines would tend to deflect the cathode rays in exactly the same direction as is shown by Schmidt and Ebert's experiments. But it remains to be seen whether in other respects this magnetic force is sufficient to account for the phenomena observed.

Ebert makes use of several arguments to show that, notwithstanding this partial agreement between the predicted and the observed results, the deflections are *not* due to the influence of the displacement currents. One of the strongest is the answer to the following question : Is the movement of the cathode rays in phase with the charging of the condenser, or with the displacement current ? If G is the electrostatic potential gradient, the displacement current is determined by dG/dt, and therefore differs in phase from the charging of the condenser by a quarter period. If the deflection is due to the

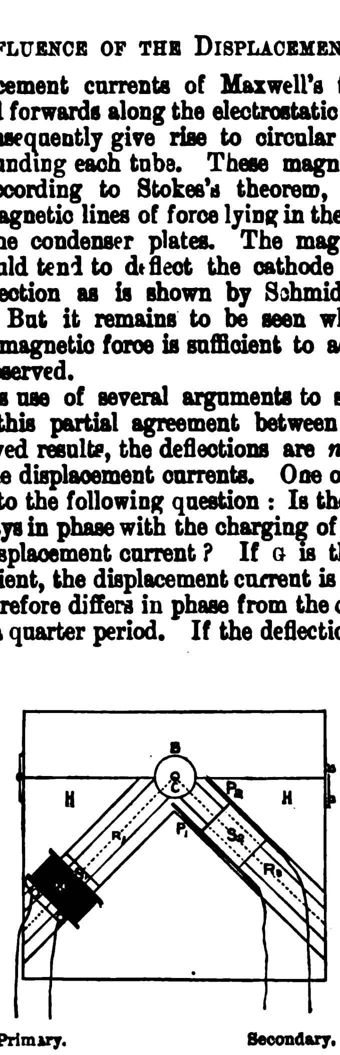

Fig. 3.

magnetic effect of the displacement current, it should have a phase displacement of about 90° relatively to the curve of tension. In order to determine this point, the primary current of the transformer was made use of for comparison. By causing the two forces, whose phases are to be compared to act on the cathode beam at right angles, the shape of the resulting curve will give the required information, in accordance with the well known rules for combining simple harmonic motions. In the primary circuit of the transformer was interpolated a small solenoid, M, fig. 3. This solenoid or bobbin was mounted on guides, B_1, at right angles to the axis of the Braun tube, B. The condenser, consisting of the two metal plates, P_1 P_2 and an intervening vulcanite block, S_2, was mounted on guides, B_2, at right angles to the axis of the tube and also to the guides, B_1. The bobbin, M, produces a magnetic deflection of the cathode rays at right angles to the magnetic lines of force, and the condenser, P_1 P_2, produces a deflection in the direction of the electrostatic lines of force. These two deflecting forces, therefore, produce deflections at right angles to each other, and the bobbin and the condenser can be adjusted at such distances from the tube that the deflections are equal.

As the result of numerous experiments, Ebert found that the figures produced by the combination of these two perpendicular oscillations were invariably approximately circular ellipses. This showed that the phases of the oscillations differed by as nearly as possible a quarter period. Now we know that the phase difference between the primary and secondary of the transformer must in this case be quarter period, and it follows, therefore, that the oscillations of the cathode rays are in phase with the charging of the condenser and not with the magnetic field produced by the displacement currents.

Ebert has also shown, by calculation, that the deflection which would be produced by the magnetic field produced by the displacement currents would be only $\frac{1}{300000}$ of that actually observed.

It may be taken, therefore, as proved, that the oscillations of the cathode rays between the plates of a rapidly charged and discharged condenser are *not* due to the magnetic effect of the displacement currents.

II.—The Electrostatic Charges on the Walls of the Vacuum Tube.

It is well known that a vacuum tube in which cathode rays are being produced shows strong electric charges on its walls. In the Braun tube, which is somewhat different in shape from the ordinary Crookes tube, the distribution of the surface charges can be easily ascertained by a proof ball and an electroscope. The proof ball (of brass) is fixed on the end of a glass rod; different parts of the surface of the active tube are touched by the ball, and the charge on the ball is then tested by the electroscope. By exploring the surface of the Braun tube in this way, Ebert found a very strong negative charge on the cathode end of the tube, which covered the whole surface of the tube to about half way between K and A (fig. 1). The charge was so strong that sparks could be drawn from the surface of the tube, and the surface charge lasted for a considerable time after the discharge in the tube had stopped. The negative charge was gradually neutralised towards A, and before A was reached was replaced by a positive surface charge which, however, was not quite so strong. This positive charge continued in varying amount up to the diaphragm, D, reaching a minimum shortly before D was reached. In the cylindrical part of the tube behind the diaphragm, D, there was found a very strong positive charge, which increased steadily towards the end, S, and reached such an intensity on the surface of the pear-shaped end, that small sparks could be drawn off after the discharge in the tube had ceased. The positive charge outside the tube implies a corresponding negative charge on the inner surface of the tube. In the active Braun tube, therefore, all parts of the inner surface of the section D S, even where the cathode rays do not strike, are coated with a layer of positive electricity, which binds a corresponding negative charge outside.

By these surface charges the course of the cathode rays is essentially influenced. It is well known that the cathode stream always moves along the axis of the tube, even with considerable variations in the shape of the cathode; but if the surface distribution on the tube is disturbed by putting one part to earth, or by drawing off sparks, the beam of cathode rays jumps at first suddenly to one side, and then returns slowly to its original position. The return of the rays to the axis of the tube is evidently due to the restoration of the surface charges by the action of the tube.

The oscillating electric field will evidently have the effect of periodically changing this surface distribution, with the result of producing oscillations of the cathode stream, in the same way in which a single disturbance produces a temporary deflection. Some idea of the mechanism by which this deflection is produced may be obtained from what follows.

III.—The Influence of the Cathode Phenomena Called Into Existence by the Oscillating Electric Field.

Ebert and Wiedemann have shown* that when alternating electric tensions are applied to electrodes on the outer surface of a sufficiently evacuated tube, cathode rays, with all their attributes of dark space, &c., are produced opposite the electrodes inside the tube. It was found sometimes, however, that these phenomena could not be obtained, though all the essential conditions of the experiment appeared to have been fulfilled. Then it was discovered that the cathode phenomena could always be started again by sending a direct discharge through the tube from internal electrodes. From this it would appear that the cathode discharges produced by alternating potentials applied to external electrodes are only possible when there are considerable surface charges on the walls of the vacuum tube.

From what has been said above, it will be seen that these conditions exist in the Braun tube, as used in Schmidt's and Ebert's experiments. When the tube was examined in a dark room, sparks could be seen passing between the condenser plates and the sides of the tube, but no corresponding cathode discharges were observed inside the tube till after the main cathode discharge had taken place.

Ebert and Wiedemann have shown† that the dark space from one cathode offers a great resistance to the passage of rays from another cathode. They described one experiment, in which, by means of a movable cathode, the rays were brought gradually closer to the dark space of another cathode. As they were brought closer they failed completely to penetrate through, but became deflected and bent round the outline of the dark space.

These experimental results can now be applied to explain the oscillation of the cathode rays in the oscillating electric field. The electric oscillations proceeding from the condenser plates, will project a dark space into the interior of the tube, first from one side and then from the other. These alternately projected dark spaces bring about the observed oscillations in the main cathode beam. According to the experiments of Kaufmann and Aschkinass,‡ the deflection *ceteris paribus* is proportional to the potential gradient of the deflecting cathode. There must, therefore, with a regular periodic electric force, be an oscillation of the cathode rays obeying the sine law. And this is exactly what has been observed.

These interesting experiments of Ebert's appear to show that the deflection of the cathode rays in the oscillating field are not primarily due to the potential gradient of the electrostatic field but to a cathode discharge which is created by this gradient. Why the dark space should have this curious resistance to the passage of cathode rays remains unexplained, though it appears to be a well-established experimental fact. Ebert, indeed, with true scientific caution, does not consider that his experiments exclude the possibility of direct electrostatic influence, but only that such influence if it exists is too weak to be shown by the Braun's tube. These experiments, however, appear to be fatal to the view that the whole of the electric current is carried by the particles of the gas in the form of electric charges. They point rather to the view that the current inside a Crookes tube differs only in degree from what takes place when a current passes through a gas outside the tube.

Ebert points out that his apparatus, illustrated in fig. 3, forms a very convenient and sensitive arrangement for measuring the difference of phase between the primary and secondary currents in transformers, and recommends its use to electrical engineers.

THE SECRET OF THE KEELY MOTOR.

Probably in no other civilised country in the world are the people more characterised by a mixture of shrewdness and credulity than most folks are in the United States. This perhaps accounts for the reason why he whom we have called quack, charlatan, and swindler, viz., the man Keely, has managed to keep alive the public interest for 25 years. We have dealt with the man and his pretensions on many occasions, and have not hesitated to state our opinion in the plainest of terms; we judged him by his works and his record, and there is no reason to alter our opinion. An opportunity of seeing the celebrated motor, and of testing its alleged performances was never presented to us, otherwise we doubt not we should have succeeded, as we have done in other instances, in showing that Keely was at best only a clever old juggler. He exhibited his greatest cleverness, however, in keeping his motor in his own workshop. We are not aware that during all the years that he was levying toll upon the purses of his enthusiastic admirers, he ever presented one of them with even a little model as a token of his affection and regard. He would invite them on to the platform, so to speak, and assure them there was no deception; but, of course, he could not be expected to give his bag of tricks away.

Keely is getting old now, and possibly, like the late Tichborne claimant, he is driven to earning a precarious dollar by getting himself interviewed, but has not now the cuteness necessary to recognise a skilled scientist in the garb of the newspaper man. At any rate, Keely has been interviewed by Mr. E. A. Scott, of the Philadelphia Engineers Club, and this "chiel taking notes" has also been taking observations, from which he concludes that the great magician's famous "apergy" seems to be only an ingenious combination of compressed air and electricity.

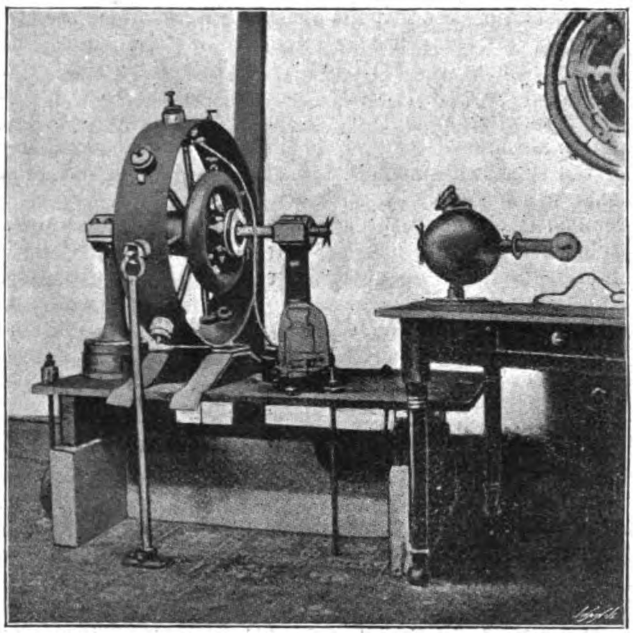
The results of the interview did not go to adorn the columns of a dime newspaper, though probably Keely thought that his interviewer was simply searching for copy (for the war had not broken out then), but were made the subject of a paper of considerable length, read before a meeting of the Engineers Club at Philadelphia.

Mr. Scott said the Keely motor has been a matter of greater or less public interest for 25 years, and yet there is now as little knowledge of what it is as when it was first announced. Probably no other enterprise making as little progress was ever kept alive so long. Keely has carefully guarded his secret; even the Courts could not extract it from him. In fact, the secret constituted the entire property, of which Mr. Keely was the treasurer, and even the company formed to exploit his supposed invention was never able to wrest it from him. Any effort on the part of the stockholders to do so has been met with the objection that Keely controlled the situation, and the value of their property depended on their keeping on good terms with him.

Many investigators, scientific and otherwise, have seen his experiments; United States Government officials and experts have witnessed them; capitalists, with millions at their disposal, have sought to control his inventions; yet there has always been an unreadiness on the part of the inventor to do anything practical. He is now over 70 years of age, and the possibility of his secret dying with him has aroused those who have supplied him with funds to the desirability of having him communicate his knowledge to someone who could continue his work.

Probably the idea of raising more money in this way originated with the man himself who, with one foot in the grave, still hopes to continue his success as an exploiter of public credulity.

The Keely motor or engine is the last of the long series of Keely's inventions, of which the previous apparatus are only experimental studies. It is supposed to embody the principles which Keely has laboured so many years to establish. He says it is operated directly by "apergy," a force hitherto unknown; that apergy consists, like light, in extremely rapid vibrations of ether, or matter of infinite divisibility which pervades the universe, the problem being to devise apparatus which will respond to these vibrations. This apparatus he calls the vibrodyne, which is thus described: A heavy cast-iron bed-plate, supported 18 inches above the floor by an iron slab at each end, bolted to the floor at each of the four corners by heavy iron rods and braced from the side walls, forms the foundation of a machine which can be prevented from running by the pressure of a finger, or stopped when at full speed by grasping it with one hand. A flat brass ring, about 4 feet in diameter, is supported on two wooden slabs resting upon the iron bed-plate, which are held to it by brass straps. On the outside of this ring, at equal distances apart, are fastened clusters of short tubes, each about a half inch in diameter and 3 inches long, called resonators. These tubes are partially filled with amalgam, or stopped up with diaphragms at varying distances from the ends. There are nine of these clusters on the circumference of the ring, and on the outside of each is a hollow binding post, to which wires can be attached. On the inside of the ring, immediately opposite the resonators, a "sensitised disc" is attached. On the inside of this disc is another binding post similar to the one outside the ring, which is also hollow, and making an open passage between the inside and the outside binding posts. There is thus a



The Vibrodyne or Keely Motor.

set of nine binding posts and discs pointing inwards, which are connected together by the mysterious platinum wire which figures in nearly all the experiments. The outside resonators and inside discs are about 2 inches apart.

Concentric with and inside of this ring is the revolving wheel. Its axis is supported at each end upon large iron pillars enlarged at the bearing of the axle. A large hub in the middle of the axle has radiating from it eight spokes, one less than the number of opposing discs on the inside of the flat ring. These spokes do not terminate in a rim, but on the end of each is a disc similar in size and character to those which project inward from the ring. There is also upon the axle near the hub a heavy iron ring about 14 inches in diameter, which revolves with it, presumably as a balance wheel to make a steady motion.

Keely set the wheel revolving in the following manner: Taking a 10-inch sympathetic negative transmitter (a large brass ball), he placed it on a table having a glass top, on one side of the room, and connected it with the vibrodyne by a platinum wire, attaching one wire to the binding post of the transmitter and the other to the binding post projecting from a resonator on the top of the vibrodyne. Then snapping some of the wires on the scale of the transmitter, and turning the handle backwards and forwards, the wheel commenced to revolve, slowly at first, and with gradually increasing speed, until the revolutions were about 180 per minute. Keely suggested that he could stop the wheel in several ways, two of which he illustrated. He pulled the wire out of the binding post of the transmitter, and it stopped. Again starting it, he stopped it by pulling out a plug in a hole in the binding post of the machine, the hole being a continuation of that hole into which the wire was thrust on the other side.

This left the transmitter attached to the machine, and gave Mr. Scott an opportunity to confirm his belief, formed from previous observations, that the so-called platinum was a small platinum tube. On the occasion of this experiment he took his seat next to the revolving wheel, not following Keely's suggestion to take another position. When Keely pulled out the plug from one arm of the binding post (which is in the form of a "T," and is hollow), leaving the wire sticking in the other arm, the other end of the wire still being connected with the sympathetic negative transmitter, he moved his face close to the hole left by the plug being removed, and distinctly felt a blast of air from the "wire." To make certain that the air current did not come from the revolving spokes, he kept his face in the same position until the wheel had stopped, and still felt the full force of the blast of air from the tube. Here was a confirmation of his belief that the wire was a tube carrying compressed air, the reservoir of which was the 10-inch globe of the "sympathetic negative transmitter." It was evident, however, that a sufficient amount of power to run the wheel for any length of time, or to run it at all, could not be stored in a globe of that size. His conclusion was that the air pressure performed the office either of an automatic switch closer or an automatic pole changer on an electric circuit. "The construction of the machine," says Mr. Scott, "points directly to electricity acting through magnetism." The unnecessarily heavy parts of the machine afford every opportunity for the concealment of the small wires necessary for the power developed, or the bolts which run down through the floor to hold the iron foundation could serve as conductors. It was an easy matter to bring a current to electro-magnets concealed in the nine interior discs, and no great amount of ingenuity would be required to construct a switch, operated upon both by the compressed air and magnetism, which would cut the magnet into or out of circuit at the proper time to attract the armature on the end of each revolving spoke. Had there been nine spokes as well as nine opposing discs, the wheel would have got on a dead centre, and could not have always been started; but with only eight spokes there were always some in a position to receive a magnetic pull before the magnets were cut out of circuit by the opposing discs being exactly opposite each other. The evidence of design here is sufficiently strong to warrant the conclusion that the wheel is operated by electro-magnets. "Apergy" would not have required this arrangement.

Mr. Scott declared that some of the most important of the experiments had since been duplicated by very simple means, which may have been the very means used by Keely. One of these was the well-known levitation experiment, by which, apparently, heavy weights are made to float in water. It was explained that the weights in the jar might be so constructed as to just sink in the normal condition of the jar, and to rise when a slight increase of air pressure was put upon the surface through a fine tube carrying compressed air, after the principle of the "Cartesian diver." This tube, called a platinum wire by Keely, was said to form an essential part of most of his apparatus.

Mr. Scott's conclusions from his personal investigations are in substance precisely the same as those to which we have always arrived, viz., that the man Keely cannot substantiate his claim to have discovered any hitherto unknown natural force, but that he is a juggler of superior ability.

OIL FUEL FOR STEAM RAISING.

A great deal has been said and written in favour of water-tube boilers in particular, and boilers of small water capacity in general, with special regard to rapid steam raising, not so much on the score of rapid steam production from cold water, but when a boiler is at work, on rapid increased production. Many who argue on the point do so entirely without thought. Assuming that the boiler is worked at a temperature of 300°, if the fire becomes more fierce there is more steam made, and if the safety valve is of proper size, the temperature of the boiler does not rise above 300°. If no rise in temperature takes place, the amount of heat in the water does not become greater. Therefore, all the additional heat of the fiercer fires has been applied in furnishing latent heat to water at 300° to convert it into steam at 300°. We see no way out of this conclusion. No heat has entered the water, for had it done so the water would be hotter, and, being so, the steam would rise in pressure. Our conclusion being inevitable, it must follow that whether the boiler contains 5 tons of water or 15 there can be no difference in the rapidity with which it will answer to a pushed fire. With engines working with 300° steam the addition suddenly of other similar units makes a demand for more steam at 300°, not for steam at 310° or 315°. If steam at a higher temperature were called for, there would be more rapid reply to a pushed fire by that boiler whose steam space was least or whose water content was least. This plain fact is quite overlooked by those to claim rapid reply to calls on behalf of boilers of small water capacity. In one respect only does a large capacity tell against a boiler, and that is where the circulation is poor, part of the water lies dead and cold in the boiler bottom, and a sudden livening up sets this water in circulation and checks the steam production instanter. But this is a fault which ought to be otherwise remedied, as, for example, by a pump to transfer the surface water to the boiler bottom continuously, a system absorbing very little power, as the pump would work in a closed circuit and have no tight pistons, or it might be a centrifugal one.

Apart from faulty circulation, the cry for little water content in a boiler required to give sudden demands is erroneous and essentially unscientific, and based on entirely false assumptions. The same additional heat will form the same amount of steam, no matter what the water or steam capacity, so long as the feed water is supplied at the same temperature in each case.

Where sudden calls for steam are made, there is wanted a fire that will quickly respond to an increased demand as signified by a wider damper opening or an increased fan speed. No solid fuel fire can immediately rise to the call made suddenly, and a sudden demand for steam must almost invariably be first met by a reduction of pressure which allows the water in the boiler to give up some of its heat by lowering its temperature. Here, then, we see the advantage of large water capacity, and an ability to give off considerable heat without too great a fall of pressure. But what is really needed is a sudden accession of fire. With a boiler at 300°, a sudden addition to the fire would give an almost instantaneous addition to the steam supply.

The problem thus narrows itself down to a means of securing the necessary increase of the fire. This must not be done at too serious an expense of costly fuel, nor can it be done at all with solid fuel, except in the shape of air-carried dust. A careful consideration of all the conditions involved, points strongly to liquid fuel as the auxiliary. Liquid fuel can be blown into an ordinary coal burning furnace without any change being made in the furnace conditions. Take Holden's system as an example. In this system a locomotive has two holes in the fire-box, through which the oil fuel is blown by compressed air in a fine spray upon the fuel on the grate. Only a light fire of coal and chalk is carried; but if desired, a heavy fire could be carried, and merely supplemented on gradients by a temporary admission of oil. We have travelled on one of Mr. Holden's oil burning locomotives with a heavy train behind, and were astonished at the ease with which the fuel supply could be regulated to suit the demand for steam, and at the way in which, at a stopping station, the oil was shut off completely, and at once re-started at exactly the previously existing rate of flow, when we moved out again.

For general power purposes, the one question is that of expense. To the central electric station engineer the demand for steam is foreseen from hour to hour the year through. The load curve, combined with a weather observation, is sufficient for estimating the proper time to get fires ready to spring into activity in time for the big demand. But in the English climate, and particularly in the peculiar situation of London, sudden unforeseen obscurations of the sun are apt to occur, with little or no warning. Under these circumstances a single movement of a lever would fill the furnaces with brilliant flame and increase steam production to a maximum. In the Holden system, oil is injected by means of a peculiar nozzle, consisting of a central mixed jet of air and oil impelled by steam, and surrounded by a ring pierced with small holes, through which steam issues, and induces a good air supply to burn the pulverised oil as it is diffused over the fire-box and the fuel on the bars.

Approximately, 1 lb. of liquid fuel will do the work of 2 lbs. of coal, and this figure can be used in conjunction with the relative prices of coal and "oil" in determining the cost of oil fuel. The cost of oil will often be prohibitive; it would soon become prohibitive if everyone took up its use, but, for sudden demands, its cost is well worth incurring for a few minutes to get over the peak of a load curve with otherwise insufficient boilers, or to get matters in order when a fog or a thunderstorm sends up the demand for current. Current demand falls off nearly as rapidly as it rises; with solid fuel the drop in demand may find furnaces full of fuel and in full swing; with oil fuel the *régime* of the furnace can be restored instantly, and further expense at once stayed.

We are confident that station engineers who undertake to try liquid fuel, say, in one boiler, will appreciate its convenience and the aid it will afford them. Liquid fuel is easy to apply, the apparatus required is small, and it need not interfere with the ordinary arrangements of a boiler. Indeed, in the Holden system, either liquid or solid fuel can be used at will. The operation of changing from one to the other may be said to consist simply in the picking up or throwing down of the coal shovel, and the opening or closing of a valve. The elasticity is perfect.

BATTERIES v. GENERATORS.

In a young industry like electricity supply, a large amount of energy has to be expended in educating the public to the adoption and use of electricity for domestic and other purposes. This accomplished, attention is turned to the best means of supplying the want which has been created.

The question of pounds, shillings and pence, enters largely into the calculations, in fact, it is the controlling factor, on it hinges everything. Before expending capital a reasonable prospect must be visible of receiving an adequate yearly profit, or great difficulty would be experienced in raising the necessary money to erect electricity supply stations.

The electrical engineer has devised various means and systems of supplying electricity for various purposes, and naturally these are all based on the economical generation and distribution of electricity, and rightly so.

Engines, boilers, generators, transformers, mains, lamps, &c., are all chosen with the above considerations well in view, and the result has been an ever-increasing and important industry has sprung up, affecting the whole community, the importance of which cannot be over-estimated.

The general demand for electricity keeps on increasing in every city and town where a supply has been established, and the little station of a year or two ago, put down as a "feeler" as it were, has grown to be an important concern which bids fair to rival, if not eliminate, the local gas industry.

This at present, to the sceptical, may seem impossible and absurd, but where do we find a customer who has once experienced and appreciated the comfort, cleanliness, and safety of the electric light, expressing a wish to go back to gas with its dirt, danger of fire, explosion, and asphyxia? The rush light was superseded by the candle, the candle by the oil lamp, the oil lamp by gas, and now a greater power in the land than even gas has appeared.

Just as each of the new means of illumination was more expensive at its introduction, until the demand and supply regulated the price and brought it to its proper level, and its increased advantages and better illumination slowly but surely gained for it the preference, so each of the older means of illumination will gradually die a natural death, but not without a struggle. Many were the blows aimed at the new comer, but it has come to stay. It is only a matter of time, and we believe a very short time, until the prejudices of to-day, many of them interested prejudices, will have disappeared, for the simple reason that no opposite interests will exist, or if they do their feeble attempts at depreciation will be treated with scorn by the majority of those who at present side with them, for by that time they will be using the new illuminant and will have learned to appreciate and rely on it.

It is the question of "reliance" which we wish to emphasise. Various means are adopted to ensure a constant and uninterrupted supply. Spare plant in the shape of engines, boilers, generators, transformers, accumulators, &c., are all in use to-day for this purpose, but who can truthfully say we have any reserve?

In cases of emergency, valuable time is lost in "getting away" with the spare plant; and if continuity is preserved at least pressure is often sacrificed. No matter how well it looks on paper to have a certain proportion of spare plant to take up the work in case of accident, we know that time must elapse before a stand-by boiler can be got up to proper working pressure, or an engine run up to full speed and put on to the work, and we also know that the expedition and precision with which these are done depends largely on the intelligence, experience, and coolness of the men on duty. The motives of economy which govern all electricity works throughout the country render a number of *spare men* an impossibility. In times of peace the men on duty have, especially during the the period of greatest demand, their hands full, but when things begin to go wrong and attention is diverted from the running plant to getting under way the spare plant, many a threatened calamity has become only too real by the insufficiency of men at these critical moments.

The vulnerable spot, which is well known to electricity's enemies, is no doubt a danger of sudden extinction. Although they are becoming fewer and fewer, and when they do occur their duration is briefer, yet their seriousness does not diminish but rather increases, for the danger is not removed. The important question which will shortly have to be faced is: Shall we continue to depend for a stand-by on spare units of plant, or shall we tackle the storage battery question in a proper spirit and have a reserve of electricity which will make us quite as independent of temporary disarrangements of machinery as gas suppliers? We say gas works store gas because they cannot make it as it is wanted, and we generate electricity because we can make it as it is wanted, and because it is more economical so to make it, and because we cannot store it in sufficient quantities to be of much use as a reserve. What evidence have we to support this latter assertion?

Electricity is undoubtedly generated cheapest when the machinery is working at full load, but this comes for such a short time each day that a great many makers of late years have been designing their plant to give best results at or about three-quarters load, because they are called upon to work under these conditions many more hours in a given time. The hours of heavy load each day are very short indeed, the peak seldom lasting more than 20 minutes to half-an-hour, yet we have to keep plant to supply current and maintain the proper voltage over the system at this time, and in addition have in reserve a reasonable amount of spare machinery.

If the output of a year was averaged over the 24 hours of the day for the 365 days, it would be found that the current could have been generated by an astonishingly small unit of plant; probably one of the station exciter engines and exciters would have been ample. It would certainly seem that if ever complete reliance can be placed on electrical supply, storage batteries must enter more largely into the composition of supply stations than at present. The installations of accumulators to be met with in various stations presumably kept as a reserve in case of need, but principally to supply the current in the hours of minumum demand, are a delusion. They are only toys compared with what they should be. If occasion arises when an unusual demand has to be put upon them they fail utterly.

Consider for a moment a station equipped mainly of huge storage batteries composed of plates nearer the size of billiard table tops than the cover of a pocket note book and we get something like a battery. As mentioned above, if the year's demand was spread out evenly over the 8,740 hours in a year of 365 days we begin to realise what a small sum would have to be spent in generating machinery. The small plant would be worked day and night in charging the huge accumulators, and as they would be working at or nearly full load the current would be generated as cheaply as possible, and this would tend to lessen the loss in efficiency in the batteries as we at present know them.

When we remember that the commercial efficiency of a battery is somewhere between 50 and 60 per cent., although the makers place it as high as 75 per cent., it is not so very far behind the commercial efficiency of a modern plant working under ordinary conditions. Coal is the largest item in out-of-pocket expense in the production, and it often happens that this item in a summer month is three times as much as in a winter month per B.T.U. generated; when this is borne in mind, the apparently wide gulf between the two systems narrows perceptibly.

A large amount of running plant requires an extensive and efficient staff, generally multiplied by three to cover the 24 hours of the day. By the storage system the wages bill would be cut down at least one-half, if not more. Wages form the largest of establishment charges, and with one-half abolished we witness a still further reduction in the great gulf fixed. Maintenance and depreciation affects both systems. No doubt the heavy charges of present batteries is largely due to having from time to time to work them under unnatural conditions. Sudden heavy overloadings do not tend to improve them, and if often repeated do great harm.

If batteries amply large are in use, then overloading should never, or very rarely, occur, and this alone would tend to lengthen the life.

Battery suppliers will gladly enter into a maintenance contract for a number of years from 7½ per cent. upwards on the original cost, making good all deterioration due to fair wear and tear.

We usually put aside 5 per cent. on the cost price of our machinery for depreciation, but this sum does not cover maintenance, which will not come far short of another 2½ per cent. Where, then, is the difference if the two systems cost the same money to instal? If the battery system costs more, should we not gladly pay more to ensure absolute immunity from interruptions in the supply from the generating station.

Interruptions from causes exterior to the generating station must be dealt with in precisely the same manner, and do not enter into the question.

Accumulators are engaging the attention of engineers at present, due, no doubt, to the prospect of motor-car traffic developing, and the efficiency and mechanical strength will increase, while the depreciation and maintenance figures will diminish.

THE ECONOMICAL USE OF STEAM IN NON-CONDENSING ENGINES.

For many years the technical papers were full of the beauties of automatic and variable expansion gear, and the advantages of the steam engine indicator. We seem likely now to be equally supplied with papers rubbing out the arguments so long advanced. The *Engineering Magazine* contains one from the pen of Mr. Jas. B. Stanwood, advocating the throttle governor for non-condensing compound engines. He quotes Mr. C. T. Porter as saying that nothing so unsuitable as the automatic variable gear could have been devised if it had not been already in use.

The range of economical working of an engine is much wider than expansion faddists would once allow. Men who swore by the indicator now find it better to pay more attention to the relation of indicated to effective horse-power, and are learning to pay attention to the internal friction of large engines which so soon puts a limit upon the desirable expansion ratio, especially when taken in combination with various other losses, such as initial condensation and interest on first cost. Mr. Stanwood realises that Corliss—and he might have added pre-Corliss English inventors—effected a big economy not because of variable cut-off but because they abolished ridiculously late cut-off, and made a valve gear capable of cutting off at about a quarter stroke. The variability was with Corliss a mere accident. It could have been well dispensed with so long as a fair cut-off was secured, any load variation being dealt with by the throttle. Had Corliss been compelled to run his engines at light loads demanding cut-off at an eighth or a tenth, he would have seen the error of variable cut-off, for the full effects of cylinder action and waste spaces would have been more apparent, and the low mean pressure compared with the friction diagram would have made the fuel cost per effective horse-power very serious. The terminal pressure would have been only 5 or 6 lbs. below atmosphere, the piston being dragged against the atmosphere. Sometimes this occurred, and disappointment followed the use of too large engines. In old style transmissions with so very much shafting and belts to move, there was always a heavy dead load on an engine, and the ratio of light load to full load was not so far from unity as with a dynamo engine which may vary from full load to a mere engine friction load, and these light loads could not be operated economically with expansion gear, the limit of expansion being soon reached, varying, however, with the type of engine—being shorter with short stroke engines. High speed engines of short stroke were found to be more economical than similar engines at slow speeds of revolution. Engines with small clearances were similarly found to have superior economy. Long stroke engines had an economical expansion of four, some short stroke engines of only two. Thus the economic early limit of expansion was respectively five and three in the two types, the reasons being those of clearance space and condensation in the cylinder. Clearance is ordinarily 3 to 4 per cent. in long stroke engines, but has been reduced to 1 per cent. in special cases. In short stroke engines it is 15 or 16 per cent.—hence the advantage of long stroke engines, for filling up clearance of compression by no means give back the loss.

Mr. Stanwood says nothing of the importance of careful design on cylinder condensation effects. There are a dozen ways in which a nominal equality of inside exposed surface may be trebled or quadrupled by careless design. On this point a report by Mr. M. Longridge may be studied with interest.

Increase of steam pressure has intensified all the losses due to clearance, and no doubt this has done so much to counterbalance the gains due to high pressure *per se*. High pressure means more weight of steam to fill up clearance space, and it means wider range of temperature and more condensation. But high pressure enables a higher minimum pressure to be carried and reduces the expansion below atmospheric pressure. Gain from high pressure could only be secured by the compound system, but this had its limits exactly as had the single cylinder, and, unless with full loads, the non-condensing compound automatic engine was a failure and economy was found to be possible only for nearly constant loads. It has always been recognised by practical engineers to be a mistake to drag round a huge L.P. piston on a semi-loaded engine. In compound engines, non-condensing, the loss due to excessive expansion below the atmosphere is even greater than in simple engines. With increase of pressure the difficulty increases, because the minimum mean effective pressure obtainable without expansion below the atmosphere increases with the pressure, and at about the same rate as the maximum mean effective pressure. Hence the ratio of the minimum to maximum mean effective pressure is not reduced for light and heavy loads as in the simple engine. Where both cylinders are controlled by the governor this drag develops in the H.P. cylinder whenever its terminal pressure falls below the high receiver pressure induced by early L.P. cut-off. Control of both cylinders involves large clearance spaces to avoid stresses due to high compression. Experience seems to point to the desirableness of not controlling the L.P. cut-off by the governor but of fixing it at about $\frac{7}{16}$ths stroke, and regulating in the H.P. cylinder only. Mr. Stanwood, however, would control both cylinders and reduce clearance losses by suitable compression and by avoiding early cut-off. Obviously the compound engine must have only a moderate expansion in each cylinder, otherwise cylinder condensation and clearance losses are brought about, and the non-condensing compound engine is only economical at uniform load and when properly proportioned to such load.

Taking into consideration all the difficulties and data, our author advocates fixed cut-off to determine full-load and throttling governing, and proposes to more fully discuss the subject in a second paper.

THE HEFNER LAMP.

In order to express measurements of light so that the results are strictly comparable with each other, all light intensities must be expressed as a multiple of a fixed unit. For technical purposes the only units available are flames, since these alone are cheap, always reproducible, and handy to use.

As the result of the investigations of the German Reichsanstalt, the Hefner lamp alone fulfils all technical requirements. The light of the Hefner lamp is designated a *Hefner candle* or simply *a candle* (H K). The definition of a Hefner candle and Hefner lamp is as follows:—

The unit of light is the light intensity of a flame burning freely in still, pure atmospheric air; the flame being produced from a massive wick saturated with amylacetate which completely fills a circular wick tube of German silver, 8 mm. internal diameter, and 8·3 mm. external diameter, and 25 mm. long; the height of the flame being 40 mm. from the edge of the wick tube, and no measurements being made till at least 10 minutes after the lamp has been lighted.

The Hefner candle was accepted as the international unit of light by the Electrical Congress at Geneva in 1896. In Germany this unit has been adopted by the societies representing the electrical and gas industries.

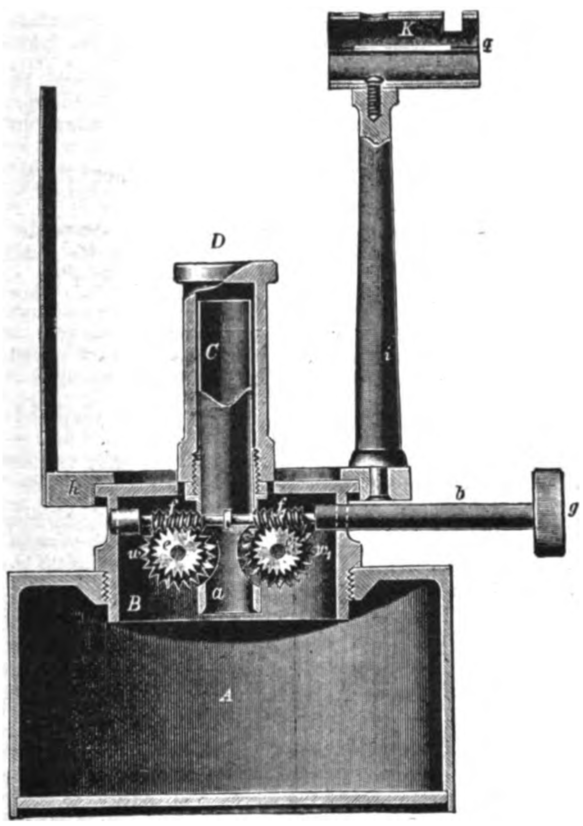


Fig. 1.—The Hefner Lamp.

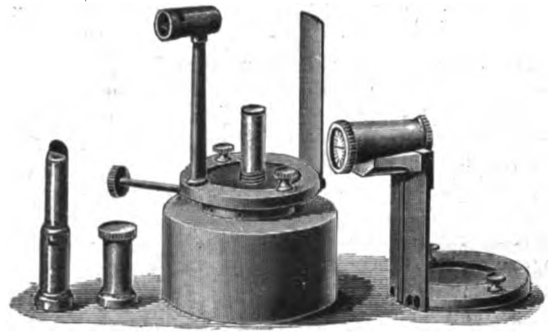
The light intensity of the Hefner lamp varies to a certain extent with the condition of the surrounding air. The influence of the height of the barometer and humidity is shown by the diagrams, figs. 3 and 4. In the neighbourhood of the normal barometric pressure, the variation of the light is of no practical importance. The variation of the light-intensity with change of humidity is also of little practical importance. On the other hand the intensity of the light is very much influenced by the amount of oxygen in the air in which the flame is burning.

One of the first conditions, therefore, for accurate photometry by means of the Hefner lamp is that the space in which the lamp is used shall be sufficiently large and sufficiently well ventilated.

The following is a description of the Hefner lamp as manufactured by Siemens & Halske, which is shown in section in fig. 1.

The reservoir, A, for the reception of amylacetate is made of brass or bronze and is tinned inside.

The cap, B, supports at its centre the tube *a*, and the mechanism for raising and lowering the wick. This wick mechanism consists of two axes, on which are mounted two toothed rollers, *w* and w^1, projecting through the sides of the tube. Fixed on the axes of the rollers are two toothed wheels, *e* and e^1, which can be turned in opposite directions by a pair of endless screws, $f\ f^1$, mounted on the same axis, *b*. This axis, *b*, terminates in a milled head, *g*, with the help of which the wick mechanism can be set in motion. The tube, *a*, projects above the upper plate of the cap, B, about 4 mm., and on this projecting end a screw thread is

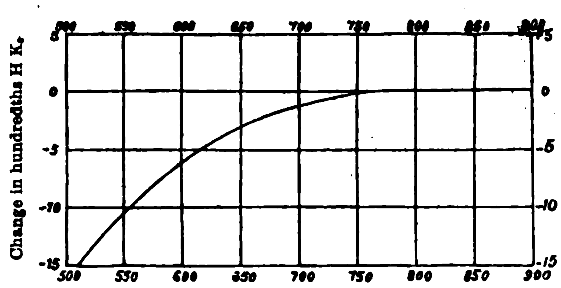


Gauge. Hefner lamp with Hefner flame measurer. Krüss flame measurer.

Fig. 2.

formed on which the tubular cover, D, can be screwed. Close to the tube, *a*, there are two openings in the top plate of the cap, to admit air to take the place of the liquid consumed.

The wick tube, C, is made of German silver without a soldered joint; its length is 35 mm., its internal diameter



Change of light intensity of the Hefner lamp with the height of the barometer.

Fig. 3.

8 mm., and the thickness of its walls 0·15 mm. It is pushed down into the tube, *a*, till it comes against a shoulder.

The flame measuring apparatus for determining the length (40 mm.) of the flame, is mounted in a ring, *h*, which in

Fig. 4.

turn is mounted on the top plate of the cap B, so that it can be lifted off or turned round and fixed in any position.

The apparatus of von Hefner-Alteneck or of Krüss (fig. 2) may be used for measuring the flame. The Hefner flame measurer (figs. 1 and 2) consists of two pieces of tube, one pushed inside the other, and fixed so that their horizontal axis passes through the vertical axis of the wick tube. The inner tube is cut in two longitudinally, and supports horizontally a polished steel plate of 0·2 mm thick, with a rectangular opening. The under side of the steel plate is 40 mm. above the upper end of the wick tube.

The Krüss flame measurer (fig. 2) consists of a tube about 80 mm. in length, of which the axis is also horizontal and passes through the axis of the wick tube. A small lens of about 15 mm. focal length is fixed in the end of the tube next the flame, and at the opposite end is mounted a disc of ground glass with its ground surface next the lens. At the centre of the disc is a black horizontal mark not more than 0·2 mm. thick. The image of this mark over the centre of the wick tube is 40 mm. above the top of the tube.

The gauge (fig. 2) serves to fix the position of the upper end of the wick tube, as well as that of the flame measurer. If the gauge is pushed over the wick tube so as to rest upon the cover of the cap B, then by looking through a slit in the tube, a line of light less than 0·1 mm. will be seen above the end of the wick tube when the latter is at the normal height; the slit at the top of the gauge should lie in the same plane as the steel plate of the Hefner measurer. With the Krüss arrangement, the image of the slit on the top of the gauge should coincide with the mark on the ground glass.

All the metal parts of the lamp, except the wick tube and the steel plate, are etched to a dull black colour.

THE BRITISH ELECTRIC TRACTION COMPANY.

On Thursday evening, the 26th ult., the staff dinner of the British Electric Traction Company, Limited, was held at the Trocadero Restaurant, Mr. Emile Garcke, managing director, being in the chair. Amongst the company, which numbered about 45, we noticed Mr. Godfray, Sir Edward Gourley, M.P., Mr. George Herring, Sir Ch. Rivers Wilson, C.B., Major Cardew, R.E., Sir Charles Freemantle, K.C.B., Mr. Atherley Jones, Q.C., M.P., Mr. Sidney Morse, Mr. Alfred Dickinson, Mr. George Flett, Mr. H. Hatchett, Mr. R. Simpson, Mr. W. Alderson Smith, Mr. Percy Sellon, Mr. J. S. Raworth, Mr. W. B. Jeffries, Mr. A. R. Monks, Mr. W. H. Scott, Mr. J. W. Alison, Mr. B. Gibson, and Mr. H. F. Woodward.

The dinner was a thoroughly enjoyable one, worthy of the occasion and a credit to the caterers, and it was pleasant to observe the mutual confidence which exists between Mr. Garcke and his able staff, a confidence which we may be permitted to hope will continue for many years to come to the advantage of not only employers and employed, but to the benefit of the travelling public. The principal toast was that of "The British Electric Traction Company," proposed by the chairman, in which he said:—

In proposing this toast, I would prefer, of course, to be able to afford you entertainment, instead of speaking of the affairs of the company, which are already too fully engrossing the attention of most of you, but the circumstances of our gathering are somewhat exceptional. Several members of the staff have only lately either joined the company, or entered upon their present duties, and there are several gentlemen present who are connected with our associated companies. It has been suggested to me that they would like some fuller information than we have yet had the opportunity of giving them as to the policy and business of the company.

The extensive character of the business will be seen from the large number of undertakings which we have already under our control, to say nothing of those which are in course of being established or promoted, and its complex nature will be at once appreciated when I explain that we not only arrange for the acquisition or leasing of existing tramways undertakings, but also undertake the initial promotion of new schemes, with a view to working by electric traction. This, I need not say, is a work requiring a great deal of judgment and discrimination. It involves difficult and weary negotiations with the local authorities, and applications to the Board of Trade, to Parliament, and to the Light Railway Commissioners for the necessary powers. When these have been obtained the work of construction has to be undertaken, and when the line is ready to be opened for traffic, a totally different kind of talent and experience is required for carrying on the business. A large number of men have to be engaged, and traffic arrangements have to be carried out which require a very close study of local conditions.

It will be seen, therefore, that the operations carried on by this company require, in their various stages, abilities and experience which it is impossible to combine in any one individual. Moreover, our various undertakings are scattered over the entire length and breadth of the United Kingdom, and are not continuous, like railways, but are divided, at any rate at present, into relatively small sections.

Having regard to the multifarious duties to be performed, the board have come to the conclusion that the highest efficiency and the greatest economy in the conduct of so extensive an enterprise can only be attained by a carefully arranged system of devolution, combined with a scheme providing for watchful supervision of details. This the board believe they have secured by a specialisation of duties, and by the appointment of district superintendents, very much on the lines adopted by the large railway companies.

For instance, the board have appointed a permanent way engineer, who will attend to nothing but the permanent way of the various undertakings of the company wherever they may be located. The tramways, which in one form or another we control, cover between 80 and 90 miles, and the tramways for which we have already obtained powers, and which have to be constructed within periods specified in the orders, cover another 60 odd miles, and this does not include any of the new lines we intend to promote.

Then we have a traffic superintendent whose duty will be to establish, as far as possible, uniform traffic arrangements. We estimate that when our present tramway undertakings are electrically equipped we shall have at least 500 or 600 cars running, and shall directly or indirectly employ upwards of 2,000 men.

Then we have a power engineer whose duty is to superintend the construction and the maintenance of the electrical machinery. We estimate that when the tramways to which we are already committed are in full working order, we shall either have to generate or purchase upwards of (10,000,000) 10 million Board of Trade units of electricity per annum.

We have created a department for carrying on the responsible work of promoting and obtaining powers from Parliament, the Board of Trade, and the Light Railway Commissioners. The undertakings in regard to which we have made definite agreements for the adoption of electric traction are governed by no less than 60 Acts of Parliament or provisional orders, and the negotiations we have to carry on with the local authorities and other bodies involve a thorough knowledge of the provisions of all these Acts and orders. In addition to these we have at the present time some 15 or 16 light railway orders in progress, and have made agreements for the promotion of about 20 further Acts of Parliament, provisional orders or light railway orders. That is as far as we can see to-day, but we are not standing still, and are negotiating fresh business from day to day.

There are several other departments, but those I have mentioned are sufficient to show the principles which have guided the board in the distribution of the duties. So much for the technical staff. Now I will say a word or two as to the geographical divisions. We have grouped our various undertakings into districts with a superintendent for each district, who will be officially associated as a director, or in some other suitable capacity, with the undertakings in his district, and he will be in direct communication through the secretary with the heads of the technical departments. In this way each undertaking or company will obtain the benefit of the best expert advice and of a wide experience at only a small proportionate cost.

The geographical divisions we have decided upon have been determined mainly by the large centres of population in which our present business is chiefly concentrated.

By-the-bye, it will be of interest to state that our Kidderminster line was opened for traffic to-day, and this little line constitutes an exemplification of British electric traction in the truest sense of the word, for all the plant and rolling stock has been manufactured in this country by our friends the Brush Company. This is, I believe, the first electric tramway in this country of which this can be said.

From what I have said you will see that we are engaged in developing an extensive and important business, and it will be satisfactory to our financial friends to know that in nearly all the undertakings we are engaged upon, the expectations of earning dividends upon the capital to be invested are not based merely upon the faith that we have in the future of electric traction. In nearly all cases we have based our calculations upon the results obtained by the companies whose lines we are converting; and we all know that if a company working an inadequate service, by steam or by horses, is making a profit, we are certain to show better results when we put upon the lines a more frequent service at a lower cost of working. I may add that the capital we have employed in building up this business is already productive of profits, and, contrary to the Ricardian law of diminishing returns, every addition to our capital is calculated to produce an increasing margin of profit over the fixed interest we have to pay.

Sir Rivers Wilson, at the annual general meeting of the shareholders, referred to the subject of municipalisation of the tramways—a question which, I think, is surrounded by a good deal of misapprehension on the part of local authorities, who do not seem to realise the great difference between the municipalisation of horse tramways, which are generally confined within the limits of municipal areas, and electrical tramways or light railways, which, to attain their highest development and fullest utility, should be constructed with a view to connecting outlying towns and villages with the cities.

Sir Rivers Wilson struck the key-note of the matter when he said that municipal boundaries do not coincide always with the centres of population, and if the municipalities construct tramways, they have to confine themselves to their own boundaries, so that the outlying villages and towns are not reached, and it is because electric traction is particularly suitable for the working of tramways extending over long distances that electric traction is not a suitable industry for municipalisation.

No one would dream for a moment of municipalising our large railway systems, and the arguments against the municipalisation of railways, telegraph and similar enterprises, which pass from the area of one municipality to another, apply will equal force against the municipalisation of electric tramways. The present tendency of Corporations to undertake the working of tramways will have the serious effect of retarding and restricting the natural growth of an industry, which, if not thus hampered, will, I am sure, extend as it has done in other countries in every direction, and contribute very largely to the convenience and welfare of hundreds of thousands of people who have to travel from one town to another, and to intervening places. If the policy of municipalisation of electric tramways advances, most of the smaller outlying places will be deprived of tramway facilities.

Not only the theoretical arguments, but the physical facts of the case demonstrate that the working of electrical tramways by municipalities will prove a social calamity. I am in sympathy on political and social grounds with the expansion of the sphere and scope of municipal life, and I am not at all averse to the municipalisation of undertakings which are confined within the limits of the municipal area, and which do not raise such large social questions as is the case with electrical tramways.

I have often spoken and written in favour of the municipalisation of electric light undertakings, but it is a question whether even this policy has not been carried too far. There are many small municipalities in the country which are not large enough to enable electric lighting business to be carried on with the greatest possible economy, and it is found now that electricity can be supplied more cheaply if generated on a large scale at a central point and distributed to these small authorities in bulk, but the fact of a local authority having established its electric light station is not the same thing as if it had been done by a company. In the case of a company making a mistake the unfortunate shareholders are inevitably brought face to face with a liquidation, and the competition of new comers leads to the survival of the fittest, but when a local authority is carrying on a relatively unprofitable business, this beneficial and effective competition is impossible because the local authorities have the power to prevent the larger and better supplier coming into competition with them.

In this way we see that the municipalisation of some undertakings stands in the way of industrial progress, and the advantages obtained from the working by municipalities, whatever those advantages may be, cannot be such as to compensate for these evils.

Now, let me refer to one or two of the physical obstacles which I venture to say municipalities cannot and will not overcome.

The difficulty of the variation of gauges in towns adjacent to each other has already been pointed out, but it is not generally recognised how widespread this anomaly is.

Which of these local authorities will make the gauge throughout the district uniform for the benefit of the others?

In our South Staffordshire scheme we proposed to alter the Wolverhampton gauge so as to bring it into conformity with the other tramways of the district.

I ask anyone will the Corporations—can the Corporations—do what the companies can and will do in the matter?

But the difficulty of municipalising electrical tramways are not confined to Corporations with small areas.

If the principal of municipalisation is sound, Manchester surely should demonstrate it. But what do we find there. Very nearly half the lines worked by the Manchester Carriage Company are outside the municipal boundary.

Among the suggestions made by the Manchester Corporation to the other authorities is one that each authority shall fix the fares in its own district. Now, this suggestion alone destroys the whole advantage to be derived from the control by one central authority.

Another suggestion is, that the several local authorities shall provide the necessary energy and electrical equipment for the working of the tramways within their districts. It is impossible to see what advantage so chaotic an arrangement of working such a large system would have over the uniform arrangements which a company working the whole of the lines would be able to organise.

I must not weary you by discussing all the other aspects of this question, but it will become our duty to face the problem before long, and we shall have to be prepared to expose all the other fallacies upon which local authorities are proceeding in this matter. If local authorities are not put right, we shall be responsible, because we have studied the question, and know the real facts. For my own part, I shall be prepared to contest the arguments advanced by those who favour municipalisation. I shall be prepared to show that the oft-quoted cases of municipal working do not support this doctrine. Then we are told that in the case of municipal tramways the profits go back to the ratepayers. Yes, but not to the same ratepayers who have produced the profits. I have been told by the mayor of a town in the North that about one-third of the total rates are paid by the railway company whose lines pass through the town. What comfort is it to the labourer in that town to know that by patronising corporation tramways he will produce profits, one-third of which will go to reduce the rates paid by the railway company?

Then we are told that corporations can borrow money more cheaply than companies; but this resolves itself merely into a question of tenure. If you give a company a tenure of 62 or 90 years, the slight financial advantage in favour of municipal loans disappears. Moreover, the grant of a longer tenure would have the enormous advantage to the community of enabling sparsely populated districts to be developed. The present system of granting concessions for only one-life period necessitating, as it does, a heavy sinking fund, precludes the possibility of either corporation or companies doing what has been done on so large a scale in the States—putting down electric tramways in anticipation of, and to encourage the growth of cities and industries.

But I have said enough to show that the subject deserves further discussion, and I only wish, in conclusion, to again emphasise that I have been prompted in what I have said on this subject of municipalisation, not so much by the immediate interests of the British Electric Traction Company, but by the feeling that, besides doing the work which lies before us, we have also the duty and the responsibility of promoting the general advance of electric traction. The work we have to do will offer scope enough for our energies and our ambition, it is a useful work, and I may say a noble work, which it is our intention to do, not only with profit to our shareholders, which, of course, is our first duty, but also with satisfaction to the public and with pleasure and advantage, combined with credit and honour, to ourselves. I propose to you success to the British Electric Traction Company, and health to Sir Ch. Rivers Wilson, our chairman.

Sir Ch. Rivers Wilson responded to the toast, in the main seconding Mr Garcke's contentions. Mr. Raworth, "in lighter mood," proposed the toast of "The Electrical Industry," to which Mr. George Herring and Mr. Percy Sellon responded. "The Visitors," proposed in a ponderously humorous vein by Mr. Stephen Sellon, and replied to by Major Cardew and Mr. Madgen, completed the toast list.

It must have been most reassuring to Mr. Garcke and his friends, for the success of their future operations, if, indeed, it did not come as a complete surprise, to hear Mr. Madgen disclaim that he represented *Lightning* on that occasion, and eloquently repudiate the policy of that journal, endangering its *raison d'être*, in fact, by agreeing wholly with Mr. Garcke's views, and boldly asserting that local authorities and the parish pump were all a huge mistake. To secure such a valuable ally is a feat of which Mr. Garcke may well feel proud, and probably this was one of the schemes to which he briefly alluded as having to deal with, but to which he did not, for many reasons, deem it necessary to specifically refer in the course of his very suggestive and interesting post-prandial oration.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

At the meeting of the Institution of Electrical Engineers, held at the rooms of the Society of Arts, on May 26th last, Mr. J. W. Swan, president, in the chair, Prof. Charles A. Carus-Wilson read a paper on "The Design of Electric Railway Motors for Rapid Acceleration." The writer gave an explanation of the contents and scope of his paper instead of reading it in full, the diagrams being projected on a screen and fully described. As will be seen from our columns, in which a reprint of the paper itself is given, the writer deals with the important question of the incidence of design as regards the motors employed in what in this country we prefer to call tramway systems, *i.e.*, those lines in which frequent stops are made, the intermediate runs being of comparative shortness. It is pointed out that in such cases efficiency may be of less importance than rapid speeding-up, while the loss of energy in the rheostatic controller, or even in the motor coils with a S. P. controller, may be so large relatively to the utilised energy, that any means of modifying the design to enable such loss to be reduced must be of value. To assist his argument, Prof. Carus-Wilson has introduced such terms as "induction factor" and "force factor."

The discussion was of a character which does not lend itself to useful summary; indeed, as several speakers remarked, the paper is one which requires careful and quiet study to do it justice, and we would apply the same statement to the discussion upon it. The speaker who opened the discussion drew attention to the idea of the controller introduced by Prof. H. S. Short, which is claimed to continue the acceleration more closely until the final speed has been reached. In his reply the writer may be said to have effectively combated the notion that Prof. Short has achieved any important advance in controlling by the aid of his apparatus. Down grades at the starting point were also referred to as straightening up the acceleration curve to a straight line.

Mr. Mordey had just returned from a short visit to the United States, and summarised his investigation of the present practice by saying that motors are now being made as large as can be worked with, the field being as strong as can be got, the tendency being to develop more and more powerful motors. The main principles seem to be much as they were years ago, the difference being in strength of field size and weight. Study and ingenuity is being largely exercised in improving controllers, although many are even now imperfect, notwithstanding all the experience on the other side. Mr. Mordey joined with several other speakers in expressing pleasure that this subject should have been brought up just now for consideration.

Prof. R. H. Smith thought that quick time service was the importance matter on electric railways. It seemed to him that the calculations in the paper were carried out on the basis of a constant train resistance. Resistance could be divided into internal and external, the former being approximately constant; but this remark does not apply to the latter. The paper seemed to regard the matter from one point of view, the possibility of covering a certain distance in a certain time. Prof. Carus-Wilson afterwards acknowledged that if the stoppages were infrequent, the ideas embodied in this paper became of less and less importance as the steady runs occupied more and more space, and the length traversed at constant speed increased relatively to that in which acceleration was allowed. Prof. Smith pointed out another view, how to get work done as quickly as possible with minimum stresses in the machinery, and certain cases could best be met by dividing the whole distance traversed into two sections, in one of which uniform acceleration, and in the other uniform retardation, reigns.

Prof. Ayrton followed Mr. Mordey in his appreciation of the service done by the writer in preparing this paper, based on experience in a country where data from actual examples on a large scale was available. He appreciated the importance of reckoning the size, &c., of motors, as is done in the United States by the draw-bar pull, which he thought was the proper way to make motors. Nevertheless, he regarded some points in the paper as blemishes: he did not, in the first place, fall in with the unnecessary use of new words. We have names which have caught on with the British public—power factor, form factor—because of the word "factor." There was the expression in the paper "induction factor," which represented the induced E.M.F. at one revolution per second: he did not particularly know the use of the term "force factor." Prof. Carus-Wilson gave his reason for using the former term as being useful when the motor was at rest; there was a certain "induction factor" to be considered, although there were no induced volts whatever—it was therefore perfectly definite and necessary. Prof. Ayrton thought that air resistance had been entirely ignored in the paper, although different velocities were considered. In the case of a railway train air resistance cannot be ignored, and will certainly not be constant. Again, the argument would be modified, if the object was not to cover a distance in a certain time ending at full speed, but from a state of rest to rest. It was interesting that, although series motors were universally used, and had been always recommended so as to start freely, that the writer had shown that they were not merely better from a speed point of view, but also from an economy point of view.

Mr. E. K. Scott referred to the connection of motors. On some lines they were always in series, on others always in parallel. The use of down grades at the starting points might modify the practice of series parallel control. He also mentioned that the curves would be affected by the use of roller bearings, and asked the writer for some information as to the modification of the curves in this case.

Another speaker took Prof. Carus-Wilson to task for his terms and notation, and wanted to know whether his formulæ were empirical or rational. He considered that all formulæ of this kind should have attached to them sufficient explanation. Then the paper seemed to be dotted all over with assumptions. It was desirable that it should be stated to what extent these were purely arbitrary, and he rather thought some of these must be wrong. One word he would say on the question of acceleration. Some people seem to think that the design of the motors was the first thing done on a railway scheme, whereas the engineer found that the number of people to be carried per hour—the load per mile in a given time—had been settled before the problem was put into his hands, and he had then to design his trains to run on a schedule already prepared.

The President felt that the paper could be utilised as a record of valuable experience, as we are now beginning the construction of electric railways. Prof. Carus-Wilson then replied. The more important of his remarks have been noted above. The meeting then adjourned, the general impression apparently being that those members who found time hang on their hands in the coming holiday season could effectively dispose of it by studying the paper read that evening.

THE EFFECT OF LIGHTNING UPON OVERHEAD POWER CIRCUITS AND THE CHEAPEST METHOD OF DISTRIBUTING POWER.

By ARTHUR H. GIBSON, A.I.E.E.

The growing importance of an effectual protection against lightning, and the admitted inefficiency of most arresters, induces the writer to record these observations, with the hope that they may be found useful to some of your readers.

It was a long while ago that the spark discharges from influence machines suggested the zig-zag appearance of the lightning flash to be the natural side view of a spiral discharge, inasmuch as sparks from the machine had a zig-zag appearance, whilst, when viewed endwise, appeared as rings.

It is noticed that in altitudes of 5,000 feet above sea level the lightning discharges rarely present this appearance so familiar at lower levels, but take the form of a more or less wavy line, often bifurcating in its downward course. This is possibly merely an elongated spiral due to the rarefied air.

In power and lighting circuits, drum armatures, especially smooth cores, are very liable, indeed, to damage by lightning; ring-wound armatures are less so, whilst hole, or slot-wound alternating current gear and transformers are rarely damaged, though some alternators with coils laid upon flat iron surfaces are frequently in trouble.

The following concerns a power transmission plant installed in South Africa by Messrs. Siemens & Halske, of Berlin.

The district is particularly infested by lightning, and the arresters used were invented by that firm.

The whole plant has run through the rainy season without any serious damage attributable to this source.

The generators were approximating to "hole-wound," pressure being 3,000 volts between lines.

An arrester was fixed upon each of the three-phase lines, generally on entering a building. The arrester itself resembles a much enlarged I. H. arrester, but has no magnetic arrangements whatever. It consists of copper wire bent to shape, and supported *in situ* upon porcelain insulators, the distance across the two outermost points at the top being about 2 feet; each earth sector was carried to a separate earth plate.

It is interesting here to remark that the ohmic R, between two earth plates, each 5 feet by 3 feet, buried near to one another, was found to be 20 ohms. The soil at times is remarkably dry.

The arresters worked well, but were unfortunately arranged rather too close together; the distance between arrester and arrester was only 13 inches, resulting in a strong tendency to arc from pole to pole, with consequent burning and cracking of the porcelain insulators.

The action of the arrester evidently depends upon the arc to E, being carried rapidly upwards by the natural action of the heated air. The rising arc, rapidly increasing in length (owing to the shape of the conductors), eventually breaks.

When a set of arresters work, the effect upon the generators is much like that of a partial short circuit, and the generators emit a peculiar note as the speed falls for a second, during which time the arc has broken, and the machine being well governed runs up to normal speed and all goes on as before.

In more severe cases the circuit fuses will go, and possibly some instruments may suffer as well.

The nature of the discharges to E vary much; sometimes one or two bright sparks like those from a Leyden jar will snap across to E on one pole, only without any arc.

When the spark gaps are adjusted as close as $\frac{1}{8}$ inch, the discharge is explosive in character, and the circuit fuses go more often than they would otherwise.

The discharge which takes place when no current is on the line does not appear to be materially different from the usual, except that it may be of less duration.

Ordinarily the lightning seems to start the arcs to E, which are vigorously maintained by the 3,000-volt current.

As the plant runs continuously, testing any line meant a stoppage of machinery somewhere, thus it came to pass that tests were not often made.

It was soon found, however, that when an E was formed on a H.T. line it was made known, first, by the telephone system becoming paralysed, and, secondly, the arresters on that particular circuit worked more frequently than they should do.

It is interesting to record that for about a fortnight, a few hours after sundown, on each day a particular arrester in the largest power station worked when there was no lightning to be seen. This one was fixed too close to the roof, and in spite of asbestos linings, a volume of vaporised copper and reddish flame accumulated round the top of the arrester, not being able to escape by rising, the flames or arcs seemed to absorb the whole power from both power stations robbing all the circuits for about a second, the flame spread in an alarming way, giving out considerable heat. This diurnal discharge was assumed to be due to accumulated static charge of lines.

The telephone circuits, which ran underneath the H.T., suffered to a much greater extent than the power circuits—discharges which hardly effect the latter damage the telephones considerably.

As a result of observations, it may be said that electrical lines cannot be struck anything like so often as arresters work, or as often as damage is done.

Those who have had the privilege of seeing a flash actually strike within 1,000 yards, will have a distinct recollection of the circumstances, and, by the way, the writer and others who have done so, noticed a snapping sound apparently quite close, and a fraction of a second before the crash.

When such discharges do take place, every dweller within 1,000 yards radius may be pardoned for imagining, momentarily, that his own house is the particular spot.

Such a discharge will cause arresters to work and blow fuses in a circuit nearly half a mile away.

The following hypothesis explains these phenomena. If a lightning discharge strike the earth in the vicinity of a highly insulated line, or any insulated area, the earth potential in the locality is suddenly changed sufficiently to cause a smaller discharge to pass into the line to equalise potentials. The lightning flash only restores potentials to normal. The sun is the real offender, and it is not necessary here to recount the process of evaporation, electrification, condensation, and consequent accumulation of static charge which goes on preparatory to the flash.

If this supposition is correct, then discharges in most cases pass from earth to line, instead of *vice versâ*; but the effect upon the apparatus is the same.

Here arises the question. Why should earthed lines suffer? such as tramways, telegraphs and telephones. Prof. Oliver Lodge has shown what the impedance of a turn or two of wire means in the case of such discharges as these, and thus the trolley wire or telegraph line becomes a condenser of considerable capacity, whose outer coating is the world in general and the air the dielectric, the only path being the motor coils or relay magnet, which have such a high impedance that the current makes a short cut, so to speak, through the insulations.

Arresters of many forms have been tried, but the one that can effectually protect a smooth core drum armature does not appear to exist. Taking a general view of the question to-day, the wisest course to adopt in distributing power, where lightning is troublesome, is to stow the drum armature away and adopt the inevitable at once, *i.e.*, polyphase machinery, with sunk windings or hole wound. Apart from the lightning question, in any power distributing system in England there is a strong tendency to hang on to continuous current and perfect the commutator (only a reformed reprobate at best), while our neighbours across the pond have thrown it out altogether, and have their shops filled with orders in consequence. No worthy reason can be advanced for this slowness.

So long as our engineers persist in connecting up the alternator coils for single-phase, and then spending golden days at the infernal task of making motors to suit, so long shall we be at the tail end of progress. The time and money might be better spent in fighting out the patent right, seeing that we are legally supposed to be fenced in and the neighbours raking in the harvest outside.

Electric lighting will soon form only a fractional part of electrical work. Tramways will make enormous headway, and when the possibilities of electrical traction become generally known, the busy railways must, and will, be operated electrically. To-day the cost of copper and transforming stations for a 500-volt collection would make the would-be promoter's hair stand on end, but necessity will provide a better system; and here lies the crux of the railway problem—one rather too large for consideration at present.

The railway can become a duct of power and light, and the owner of the cotton mill by the wayside will cast out the boiler and engine and put in some motors, "because it is cheaper."

These prophetic remarks some may disagree with, but calmly work out the possibilities of a power station at the pit's mouth, with modern automatic coal-handling gear, and half-a-dozen marine engines of about 5,000 H.P. each and a 30,000-volt transmission, it will then be clear that such is possible, and must be cheaper than conveying coal to the various points. In other words, it is cheaper to send the power along the wire.

When this is recognised, the sooner the problem is tackled the better, or Uncle Sam and others will be demonstrating, just as in the case of the tramway. In fact, Uncle Sam is at it already.

MECHANICAL DRAUGHT.

THOUGH, perhaps, open to the charge of special pleading, the publication by the Sturtevant Company of anything upon the subject of mechanical draught will command attention as representing the experience of makers of fans who have had a considerable experience in schemes of draught. Chimney draught, or so-called natural draught, is, *prima facie*, at fault, or it would not be found so often supplemented. For many years assisted draught was simply chimney draught helped on by other means, but now the chimney has come to be looked on in the light of an expensive superfluity. Artificial draught is made variously by steam induced air currents, by blowing engines and air compressors, and by fans, exhausters, and positive rotary blowers. The Sturtevant Company object to all except the centrifugal fan, which to-day is the accepted substitute for the chimney, and it may be applied in two ways, either to give a plenum by blowing air into a closed boiler room or a closed hearth pit, or by exhausting from the outlet end of the furnace, and merely a low chimney is required to deliver the gases at some height above floor line. Such was the system first, we believe, employed in England at the factory of Sir Henry Edwards, near Sowerby Bridge, in Yorkshire. Fans were placed at the back of each boiler which delivered air to a chimney only as high as the mill. The arrangement was said to have been due to a personal quarrel and litigation over a chimney, Sir Henry finally deciding he would have no chimney. With the closed ashpit system there is a tendency to blow flame out of the door, and obviously some chimney action is necessary to prevent this. Hence the use of double fronts in marine practice which serve to keep back the flame, and, of course, the air blast ought to be automatically stopped when the door is opened for stoking. By this system the air may be heated by means of the wasted gases, an arrangement not practicable with the closed stokehold system. The ss. *Dania* showed an economy of 13 per cent. per day and a shorter voyage by 5 per cent. when fitted with fans as below:—

Conditions.	Days run.	Knots speed.	Coal per day.
Natural draught	17·00	7·50	9·76
Forced draught	16·21	7·58	7·75

The closed stokehold system is usually impracticable on land, and chiefly useful for naval purposes when ordinary steaming can be performed on natural draught, and the forced draught is used for emergencies to maintain high power, during an engagement for example. In the induced system, which is the most easily applied because it involves no change of arrangement, the fan can simply be placed in the flue to the chimney. Its leakages are always inward. Mr. Blechynden is quoted to the effect that with ordinary good arrangements a fan draught enables the steaming power of a boiler to be increased safely by 30 to 40 per cent. for continuous work, and by 100 per cent. for short runs, and this may be secured with a smaller fuel consumption per H.P., probably because the better draught permits of thicker fires and reduces the excess of air. Inferior fuel may also be employed, and we have known considerable economies to be thus secured. Equally important is the elimination of all weather conditions which sometimes put a stop to work. Fans may be large or small, as necessary to location, speed being inversely as size, and they may be of cast-iron or sheet steel.

It is recommended that as far as possible the fan driving power should be independent of other sources of power. The fan should have its own independent engine direct connected where possible, as usually it is with large fans. Induced draught by fans seems to be almost a necessity with garbage destructors. Thus at the Shoreditch destructors 12 cells, each of 25 feet square feet of grate area, heating six water-tube boilers, are blown on the closed ashpit system by three motor-driven fans of a capacity of 8,000 cubic feet per minute. They deliver by underground duct to the ashpits at a pressure of 3 inches of water, and they draw their air from the sewers, and to some extent from the space above the cells, where otherwise the men engaged dumping the rubbish would find the heat unbearable.

With a chimney, a certain temperature of the waste gases is an absolute necessity. With a fan there is no heat required, and where a fan is employed it is only reasonable that the waste gases should be cooled much lower than they ought to be with a chimney draught. The problem for engineers who employ fan draught is to secure this reduced waste temperature. With a better draught and properly arranged thicker fires on perhaps shorter grates, the excess of air admitted to a furnace will be reduced, and the furnace temperature will be higher, so that even the same final temperature will represent a less proportion of the initial heat, or, in other words, the final temperatures with and without fan may be alike, yet with the fan the weight of escaping gas may be only two-thirds or three-fourths of what it was without the fan. This itself means a large saving but with lessened temperature as well the economy will be even greater. Waste temperature may be reduced by using the gases to heat an air trunk to carry air to a closed ashpit where such a system is possible, and there are many factories where steam is used for heating drying stoves that could as well be worked from the heat of the waste gases either passed directly through pipes, or perhaps better used to heat air to be blown into the drying room by an independent fan.

ELECTRICAL SHOP TRANSMISSION.

In a recent paper by Mr. Dimick, read before the Chicago Electrical Association, attention was chiefly confined to a description of a plain two-wire 220-volt system with motors belted to line shafting in the various departments. Other systems used to some extent in American practice are the 220-volt three-wire and the 500-volt direct and alternating systems.

The author refers to the use of separate motors to each machine requiring power, but while this may be the most economical as regards power, unless the motors are needed of at least 5 H.P., the first cost is prohibitive in most cases. For 5 H.P. motors, however, it may be employed, seeing that motors can be purchased at per horse-power.

The two cases which usually come under an engineer's attention are the changing of the belt or rope driving of an existing shop, and the equipment of an entirely new shop, which is, of course by far the easier problem. The first case is often complicated by the necessity of avoiding any stoppage of machinery during the change, and this demands a good deal of ingenuity and scheming. The great question to decide is how much power does each section require, what will be the minimum, maximum, and average loads, and what allowance is needed for future extension. Often mere assumptions must be made, and on this point we think much might be done with transmission dynamometers, instruments for which there ought to be a considerable demand. Assuming that the various powers have been decided upon, the author states what is the practice in modern power plants with regard to the size of generator to be employed. Units are to be as large as possible, with one in reserve, especially if the day be of 24 hours, and it will usually be practical to have a small unit of 50 or 100 kw. for periods of small load and for overtime.

Besides the usual switchboard outfit there should be a recording ammeter or wattmeter in series with the bus bars, and a recording voltmeter. Distributing switches should be of ample capacity to provide for futures. An ammeter on each circuit is desirable, as it will save many future tests. There should be provision for ground test through the voltmeter. Cables from the generator to the board of not over 800,000 circular mils cross-section are easy and convenient for use. They can be doubled, trebled, or quadrupled, if needful, in parallel, and are cheaper to put up, and use less copper than larger cables. They should be lead covered between the board and generator.

The most expensive, and by far the best system of feeders to distribution circuits, are the lead covered cable in iron pipe, or in iron armoured conduit. The objection is the difficulty of tapping a circuit, but the cables are safe from injury, and from sagging and loops.

The terminals should be sealed or soldered into the fixtures. With lead-covered cables, a large sleeve is wiped onto the end of the cable and filled with a compound that will not run out if the end is pointed downwards.

For sub-division there is needed a switch and a plug fuse for each motor circuit on each floor at the junction with the main riser or feeder. The switches may be dispensed with—they are costly—but the fuses should remain. Fig. 1 shows the arrangement of boards on the floors, while fig. 2 shows a branch block to be used on the ends of sub-feeders from the boards where more than one motor was required.

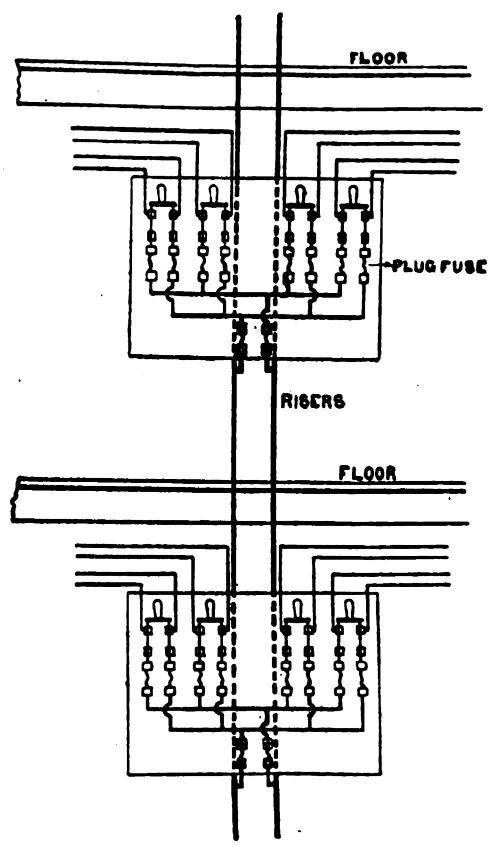

FIG. 1.

It ought to have a plug switch or fuse, and a fireproof cover.

The motor-starting apparatus ought to be alike all over the system. The switchboards should be of slate and uniform in size, and should carry a switch, a fuse, a starting box or rheostat, pilot lamps and ammeter, which is worth its cost, even if not absolutely necessary, for it shows when the motor is overloaded. The chief item is the rheostat.

There are two good rules. "Put in a motor big enough to do the work without over strain;" "use a good automatic starting rheostat;" on these two depend the success of

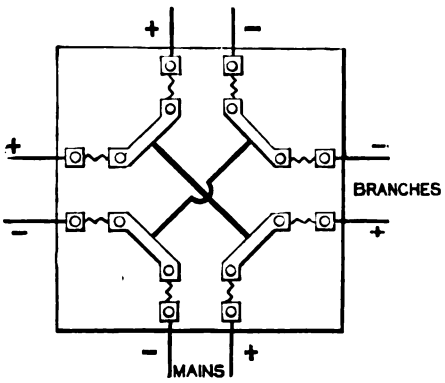

Fig. 2.

a motor transmission; say there are 100 or 150 motors in operation, and as many starting boxes, all the rheostats must return to the starting point of the circuit breakers open at the generator.

An automatic rheostat means, properly, one that will open the armature circuit as soon as current ceases to flow, and make it impossible to start again until all the resistance is in the circuit. Lately, overloads have been included also. A good rheostat ought to be thoroughly fireproof; the resistance steps should be proportioned to avoid injurious sparking at the switching segments or allow too great a difference of current to flow before the armature is up to speed; the segments should be large and massive; the contact arm easy to work, and the contact piece itself ought to be the point of wear and tear, easily removable and cheap. The segments and moving contacts must be kept clean and free from burned spots.

The automatic part is usually a magnet to hold the contact lever in position when the resistance is all out, and when the circuit opens from any cause the lever is thrown back to starting position by a spring, or by gravity.

Another magnet, or the same one, performs the same operation for an overload. These magnets are in series with the field, in series with the armature, or across the feeder terminals. The common troubles are the failure to act when it should, or it acts when it should not, and the burning of the segments or contact. Minor troubles are the burning out of the resistance coils or magnet spools, spring breakages, screws loose, contacts overheated, &c. There is a field for the rheostat that will perform its duty as above, and be free of half the troubles named.

Motors for steady work should have a 10 per cent. margin. Motors for a heavy load of a few hours, and a light load for the balance of time may be 15 per cent. over size. Motors rapidly changing from no load to full load, or reversed often and quickly, must be 20 to 25 per cent. larger; large liberal allowances will soon pay for themselves in repairs, especially in commutators and the waiting for new ones to be put in. Then there is always room for more machines in every large factory, and they ought to be provided for in a margin.

When completed, tests should be made to show where improvement is possible. Every machine can be tested as regards the power it consumes, and on this point we think engineers generally might tabulate any useful data by giving the power absorption of all machines they can indicate. Such information is very much needed. There is very little real knowledge of power absorption outside the textile mills, and there only with the addition of shafting, so many spindles going to a horse-power. Engineers' machinery, grindstones, grinding mills, cement grinders, and all manner of machinery in general trades are run very much on guess work. This is not as it should be.

No one seems to really know how much power it requires to run even a railway carriage, or, if known, those who know stick to the information.

CORRESPONDENCE.

Re Nash's Patent.

In your issue of May 27th you give a notice of the decision of the Comptroller *re* the Electrolytic Company's opposition to the grant of Nash's patent. As the terms in which the notice was made would convey the idea that the opponents had succeeded against us, we send you a copy of the Comptroller's decision, and copy of Nash's specification will be sent by our agents, Messrs. G. F. Redfern & Co., from these you will see that the decision is entirely in favour of Nash's patent. The word ordered to be struck out, and the disclaiming clause, do not interfere in any way with the construction of the apparatus.

So far from being a copy of any other patent, it has distinct advantages on any other apparatus for this purpose. The deposit is very ductile—a result which has not hitherto been obtainable. A substantial deposit is made in one-third the time in that taken by the opponents; it is much more convenient to use, the container being lifted from the vat without the use of ropes and pulleys, and, by using a duplicate container, the apparatus can be kept continually at work. By the use of specially made insulating material in the construction of the container we avoid the deposit of metal upon the apparatus, this being a decided advantage over the opponents.

To sum up the advantages of this apparatus we would claim:—a better deposit, convenience in use, and economy in time and material.

Kindly give this notice of correction in your next issue.

W. Canning & Co.

Lumford Mills, Bakewell.

Doubtless your paragraph with reference to our firm having purchased the above mill was inspired from some local paper. The facts are as follows:—We obtained an option of purchase of the mills, which we afterwards transferred to the D.P. Battery Company, who are now the owners of the mill. As there is 150 H.P. laid on from two large water-wheels, besides 150 H.P. from a "Marshall" condensing engine, we have little doubt that the company will shortly be producing accumulators at a price which has hitherto been considered impossible for first-class work.

Drake & Gorham.

ELECTRIC ELEVATOR INSTALLATION.

Americans shout so much over their performances which, when different from European practice by reason of climatic and other environment, they claim as evidence of superiority, that it is a marvel they have so little to say in respect of their systems of elevators, for in this branch of engineering they are really and without contradiction far ahead of Europe. Should an American ever enter the mouse ladder as it is found at, say, the Mansion House Chambers, he would become hopelessly insane before he reached the fourth floor. In America tall buildings and rapid elevators have acted and re-acted upon each other, until the one has grown out of all reason and the other has become a very perfect piece of machinery. Stairways in an American office building are there, but are hardly used. Some idea of the business in elevators may be gathered from the *Engineering Magazine*, wherein Mr. P. R. Moses states there are more than 6,000 in the city of New York alone, and these make over 500,000 trips per day, and carry more passengers than the tramways or the elevated railroads combined. Our author considers that the new electric underground railways of London will concentrate business in London in the same way as it has done in New York, and lead to 12-floor buildings in spite of the building law. While we do not think the author can have appreciated the different conditions of London and New York, and the fact that the concentration of New York business is not likely to be paralleled in London, we do entirely agree that there is room for an entire change in the London system. In London, office buildings are much too small, and their arrangement is of the worst. The building we have referred to is an example of thorough badness; it is also an example of one large enough if properly arranged to afford at lease three rapid elevators. London office buildings are badly worked, in fact, there is no working at all about them. An ideal office building is warmed and lighted, fitted with a centrally-controlled clock, and supplied with at least one elevator for each 75 rooms, under charge of an attendant who is there when wanted. Compare this with Leadenhall House, with its slow service and minutes of waiting, and it is easy to see why upper floors in London bring such small rents, while in New York they bring in practically as much as the lower floors. The future elevator will be electrically operated. Elevators are machines demanding severe mechanical conditions to be fulfilled. They attain a speed of 600 feet a minute in about five quarter seconds without a jerk, and they decelerate equally quickly. They must be safe. They have the enormous advantage that they always have a clear road, and can be fully open for inspection. Passenger elevators of high speed vary from 300 to 700 feet per minute. Below 150 feet is considered low speed. Freight elevators do not exceed 300 feet. Three types of electric elevators have been perfected. One is the device of a screw and multiple sheaves, the screw taking the place of the ram of the hydraulic Otis lift, and the cage hanging upon the single fall end of the rope, which is wound round the multiple sheaves.

The second type embodies the double worm gear drum, and the third type is that of the single worm gear drum, the second variety having the advantage over the third in the well-known balance effects of the double worms. Each of the worm gear types has the motor on the worm-shaft, the worm operating a large worm-wheel on the cage rope drum. Motion is arrested by removal of power, and by brake on the motor-shaft, or by closing the motor circuit through a resistance, and causing work to be done by the car through the motor. The screw type, which was contrived to imitate the Otis type, raises the cage by power, and lowers it by gravity. Ball-bearing nuts are used on the screw, and the multiple sheaves multiply the nut travel about 10 times. In a 200-foot building the nut must, therefore, travel 20 feet on the screw. The conditions to be filled are very various, and depend on the kind of work and the space available. A small available space may be utilised by high speed machines and skilled attendants. Apartment houses, with women and children, obviously require different treatment from a busy office building. In small buildings the power to be used becomes a question, if available from some public station.

Again, the heating system of a building affects the type of engine to be employed. Safety is the primary requisite. Hence there must be safeguards against dropping, should ropes fail; against excessive speed; against all sorts of conditions of overload, and for automatic arrest of motion at the limits of travel. All parts of vital importance, as the sheaves, ropes, lines, &c., must be of far excessive strength, which costs little.

One system of control allows of speed being varied by the attendant in the car; the second does not, except for starting or stopping. The first method is secured in two ways: by a pilot motor operating to vary the resistance on the main circuit, as in the Sprague system, with an inverse variation in the motor field strength; the second, by the Leonard or variable voltage control, where each motor has a separate generator, and the car speed varies in accordance with the electric pressure in the generator, this being determined by a resistance in series with the small field current, and is adjusted from the car. The Leonard system is employed only on worm gear machines, and could not be operated on the screw machines. The system of varying voltage is an ideal one for start and stop, either from the economy or comfort standpoint. On the other hand, from the point of total economy, the rheostat control is advisable, because of the continuous operation, and the first cost of a separate generator for each machine. The proportion of time during which the car is moving rarely exceeds five-eighths, and generally falls below one-half the total nominal hours of work. Each generator must be sufficient for starting loads, and therefore runs at a low efficiency. Data of 17 elevators picked at random from 100 tests show speeds of 60 to 450 feet per minute; maximum capacity 1,500 to 3,000 lbs. live loads from a minimum of 150 to a maximum of 1,600 with an average of 593. In a tall office building the average load was under a seventh of the maximum, and even where elevators were worked to their fullest capacity the average load did not exceed a fifth of the maximum.

Applied to worm-gear machines, the system of variable voltage is shown to be less economical and simple than the rheostat control, but is superior in smooth starting and operation. In low speed buildings, where variable speed is not essential, a solenoid control answers well; it may be operated by electricty from the car, or the shipper rope and wheel may be used to close switches, and operate a brake.

House elevators have automatic control, and include push buttons on each floor, to bring the car to the landing; automatic locks to hold the doors till the car is there; door switches to prevent movement while the door is open, and a means to prevent the car being called by more than one person at a time. Spring and trigger actions are to be avoided, and positive action substituted. An important branch of control is the car stopping which has to operate under such various conditions of load and speed, and where loads are heavy, the car ought to perform work, and a device for this is necessary to easy operation. For high-speed machines the car must likewise do some work on the brake band, as well as electrically by short circuiting.

The use of brakes with worm gear depends upon the variety of worm. Low pitched threads, of course, will not start under car pressure, but coarse pitches will reverse, and a brake must hold the car or it will run the worm. With fine pitches the brake becomes simply an emergency stop. The flat pitch worm is less economical, but has the added element of safety. The question of counterweight is important, and theory shows that a minimum of inertia must be sought. The car should in practice have a fourth to a half more downward force than the balance weight. On drum machines there may be two weights, one on the car of two-thirds its weight unloaded, the other on the drum equal to the unbalanced weight of car and to the average load. In high buildings a variable counterweight attached to the balance and to the car to balance the rope variation may be used in the form of a chain hung to both car and balance.

In high speed service a car must never be over-balanced, the excess counterweight system is at fault and should be abolished, for in case of accident, the ropes are sure to break when the car is at the top and drop the car, if safety appliances fail. Counterweights may be arranged to move at half or a third the car speed. This reduces inertia, and reduces the cost of the weight guides and ropes. A useful speed is that which in any building will make the round trip without a stop in half a minute. This is a good rough approximation, and may be modified to suit exigencies. Special elevators for upper floors only are a doubtful success. Call pushes at the various floors and car position indicators help the service speed. In high buildings the large inertia, due to high speed, must be met by strong cables, fixed limits of travel, and underbalanced cars, with slow moving counterweights, conditions only filled by hydraulic or screw electric machines, and not at all suitable for gear drum machines, which cannot accomodate triple ropes on the drum.

With the screw and ball nut there are multiple sheaves on the nut, the rope from the last sheave going to the bottom of the counterweight and to the top sheave of the weight, other ropes pass to an anchorage at the building top, and to the overhead sheaves of the car. An interval of one second, with the screw making 250 turns per minute, would carry the car 8 feet 4 inches, with a 20 to 1 multiplication. Any higher speed must be by increasing the speed of screw. Worm gear drum elevators are all right below 350 feet velocity per car. They are accorded little cars in residences, apartment houses, or sidewalk hoists, and must be self-oiling, have self-cleaning switches, enclosed motors and parts, and arc arresters. All types of elevator require strength, sparkless commutation, ventilated armatures, carefully secured lugs and winding, no sharp corners, fields variable and balanced, and they ought not to be highly speeded. Hoistways should be skylighted, fireproof, and with screen below overhead machinery. There must be a space above and below as a safeguard against slip or stretch of ropes.

With worm-gear elevators in numbers, descending cars help to raise those rising, and economy results.

Elevators are more cheaply worked by electricity than by any other means. The power per car-load in office buildings varies from 2 kw. hours, with overbalanced worm gear, to 4 kw. hours with unbalanced screw. Central station costs, of 10 cents per H.P. hour for small, to 10 cents per kw. hour for large consumers, are \$3 to \$10 for residences, \$10 to \$20 for apartment houses, \$15 to \$40 for loft and small office buildings, and \$40 to \$60 for tall office buildings, per month. To the question of safety, the answer is that no person has been killed outside their own fault. No electric elevator has fallen, and they run in most unsuitable places for machinery.

Surely, in London, where there is such an outcry for the day load, something might be done to get electrical elevators to work, even in such buildings as do exist. But we wonder continually that our architects have absolutely no ideas as to the conveniences and uses of buildings. Their one idea is to present something that will look well from the street—we don't say they even do this; but they certainly are destitute of all internal ideas, and in this respect they ought to study America. One need not go up 12 floors or even eight. A properly designed six-floor building would provide double the convenience of an existing London office building. Why has London not absorbed the desk room idea. In New York a man hires simply desk room in a large building as big as a bank. He has room for his desk, a safe, and has the use of all conveniencies and a good address for money that would only rent a poor room out of sight in a dirty corridor up a back flight of London stairs. We have much to acquire from Americans in this respect, and the elevator is what is wanted to secure this end. Once get a large number of elevators in London, and the rebuilding or internal remodelling would be bound to follow.

THE CHELMSFORD SHOCK FATALITY.

At the inquest held at Chelmsford on 23rd ult. into the death of Edward Fell, of the Chelmsford Electric Lighting Company evidence was given to the effect that deceased had been in the employ of the company since they first undertook public lighting eight or nine years ago.

Ernest Garrard, an articled electrician at the arc works, said that on the morning of the 21st ult. about a quarter past ten, he was with the deceased in Conduit Street. He was going to switch off a transformer, and witness assisted him to remove a lid from a surface box. They took the lid off, and deceased got down into the pit.

The Coroner: When the lid was on, the current would be running?—Witness: Yes, unless it was switched off at the works.

Is it possible to switch off the current in the pit?—No; only the secondaries.

Did you receive any instruction that morning at the works as to where you were to work?—No.

Did deceased tell you that the current was running, as he had not switched it off?—No; we knew it was charged.

Where would he switch it off?—In the engine room, on the switchboard.

When you go to these boxes, whose duty is it to switch off the current?—The switchboard man, but if he is not present the man who is going on the circuit would switch it off, place a ticket on the board with the words "on circuit" upon it, and then sign his name in a book.

What happened when he got into the pit?—He switched off the transformer. This means that he cut off the current between the transformer and the private houses, but that the current between the transformer and the works was still running.

Was there anything to show that there was current running between the transformer and the works?—No; but the transformer was humming, and he knew it was on.

Had he said anything about turning it off before leaving the works?—It was not necessary, as we were only going to take off the secondary wires; and, for that purpose, the switching off of the transformer has the same effect as if the current is switched off at the works. I do not think that he thought anything about the switching off until he got to the pit.

Was he in the act of switching off the transformer when this happened?—He had already switched off, and, as far as I could see, was coming out of the pit when his right hand accidentally touched the wire. He did not catch hold of the wire, but simply touched it.

And he was accidentally killed?—Yes.

The wire was charged to the extent of 2,000 volts?—Yes.

Is it usual for men to work in these pits when the current is running through them?—If a man goes to work in a pit, he knows which circuit he is going on, and he switches the current off at the works before going into the pit.

Did you hear deceased give anyone instructions to have the current switched off that morning?—No.

Has he worked in the pit before with the current running?—Yes.

Is it a rule to work in them when the current is on?—It is a rule that the men should not go into a pit when the current is on. They have no right to touch the "leads" at all.

The man had no right to work in this pit with the current on?—Certainly not.

Replying to further questions, Witness said the men who worked in the pits were supplied with rubber gloves and boots, and also with a written notice stating "No one is allowed to touch wires carrying high-pressure currents, except in cases of emergency, and then only when wearing rubber gloves." Deceased was not wearing gloves on Saturday.

Do you know why?—Because he had no intention of going on the high tension circuit.

How large are these pits?—Some are very large, but this one is very small. It was never intended to be a transformer pit, but he put a transformer into it.

A Juror: Are the wires protected in any way?—Witness: They are insulated.

How was it that when he put his thumb upon it this insulation did not act?—Simply because the current inside was at such high pressure, and I think the cable was damaged by the wet. He had no gloves on. There you are!

Do you think that if he had had gloves on this would have happened?—I do not think so.

A Juror: If he had touched his leg against the wire do you think the effect would have been the same?—Witness: I think so.

A Juror: Are these wires supposed to be safe if you touch them?—Witness: Oh, yes; the contractor guarantees them to be, but we won't take the risk.

Was it damp when he touched it?—Yes, it was wet, and the ground was damp. This had a great effect upon it.

Mr. Duffield (representing Messrs. Crompton): Is it necessary for a man to get into a pit at all?—Witness: Not in this case; but I think this is the only one of its kind.

Mr. Gray (representing the widow of the deceased): If a man is not going to touch the high pressure wires he will not wear gloves?—Witness: No.

Are there any printed regulations dealing with these secondary wires?—No; they are not necessary.

Then he did nothing out of the usual that morning, apart from the accident of touching the wire?—Nothing out of the ordinary.

Was this transformer a temporary arrangement?—No; but the big pit near the Oak is being constructed to abolish all these wretched little pits.

The present little pit with a transformer is not considered satisfactory?—No, I do not think so.

The Coroner: In your opinion it is not satisfactory?—I am not a judge; but if a man is to be killed as easily as that, I should say it is not satisfactory.

In reply to further questions by Mr. Gray, Witness stated that on Saturday morning deceased received instructions from Mr. Entwistle to remove the hoarding which had been erected over the pit at the Royal Oak corner.

Mr. Duffield: The removal of that hoarding had nothing to do with this accident?—Witness: Yes, it had, because in order to remove two lamps on the hoarding the transformer had to be switched off.

A Juror: Did Fell know that the wet was so great that it would make the wires dangerous?—Oh, yes.

Yet he went into the pit?—Yes.

Do you consider it was his own neglect that brought him to his death?—Yes.

A Juror: Has Fell ever been suspended for a week for not wearing gloves?—Witness: Not to my knowledge.

Not after his last accident?—Not to my knowledge.

In reply to another juror, Witness added: If the pit had been larger I could have got down and knocked him off the wire, but it would have been of no use. I ran over for James Brown, and we lifted him out.

Mr. Gray: What reason have you for saying that his death was caused by his own neglect?—That is a very hard question to answer.

You have told us that he did nothing out of the usual way, and that the touching was an accident. Where was the neglect?—Going into a pit in which there were high tension wires without gloves.

But you told me that it is not usual to wear gloves when a man is only going to touch secondary wires?—That is so.

Then it is not true to say that there was any neglect?—No.

These wires being guaranteed insulated, you would not expect a shock?—No.

A Juror: I have seen the man down this pit several times. It is so small that I do not think he could take a knife out of his pocket without touching the side with his elbow.

The Coroner at this point announced that he should not conclude the inquest that day, and that, after hearing the doctor's evidence, he should adjourn in order to give the Board of Trade an opportunity of being present.

Dr. Bodkin stated that when called to the deceased he was quite dead. Witness examined him and found an injury to his right hand. The thumb, together with a portion of the joint, had been what he might describe as blown away—burned off. There was a tracing up the arm where the electricity had apparently gone, the skin being taken off just as one would peel an onion. Death was due to shock, and had been, he believed, instantaneous.

The Coroner: Did the shock go to his brain?—Witness: No; I think it went through his body to the earth, and so interfered with the heart's action.

The inquiry was adjourned till Thursday, 26th ult.

When the inquiry was resumed the Coroner said: Since our last meeting, I have communicated with the Home Office with regard to this matter, and their inspector was down here just now, but he considers that it is not a matter that comes within his department. I understand that Major Cardew has been down and made investigations for the Board of Trade. Therefore, if he considers it a case which he ought to advise the Board of Trade to afterwards take up, he may do so; but we shall have no one here from the Board this afternoon.

William Entwistle, engineer to the Chelmsford Electric Lighting Company, said that he superintended the running at the lighting station. On the Friday evening he gave deceased instructions to remove the hoarding around the work which had been going on near the Royal Oak Inn. Witness knew that there was a wire on the hoarding which it would be necessary to remove, because he ordered it to be put on. Deceased placed it there himself a fortnight before.

The Coroner: Was it necessary to switch off the transformer in order to remove the wire from the hoarding?—Witness: It was not necessary; and Fell switched it off for his own convenience.

Then it was not absolutely necessary to switch it off?—Not necessary at all. Could the wire be removed with perfect safety without being switched off?—Yes, with perfect safety.

Was there any necessity at all for the deceased to get into this pit on this particular occasion?—There was no occasion for him to get into the pit to switch off the transformer. I do not know whether he had any other reason for getting into it.

Could he have carried out his work quite as well without doing so?—Yes.

Can you tell us the size of this pit? Is it an ordinary-sized pit?—It is one of our smaller pits, and the approximate dimensions are 2 feet 6 inches × 2 feet.

A Juror: Inside the pit is only 21 inches × 26 inches.

The Coroner: Have you ever had occasion to speak to the deceased for doing any work without wearing gloves?—Witness: I have never had occasion to do so.

Have you ever warned him?—I have admonished him. I do not mean that I have ever caught him handling wires without gloves, but I have warned him against touching them.

Are these wires supposed to be safe?—If the wires are in a thoroughly sound condition, they should be quite safe when charged, even if touched without rubber gloves.

Is dampness likely to make them dangerous?—When the rubber insulation is sound it should not make them less safe.

Are you of opinion that this small pit was safe to work in?—It was not safe for any man to work in. I should forbid any man on the job, barring Fell, to get into the pit.

Owing to the smallness of it?—Yes.

I presume you mean by that that Fell was the most experienced man you had?—Yes. As foreman it was his place to forbid anyone to get into this pit without his permission.

You are of opinion that he was aware of the danger he was running in going into it?—I am certain he was.

Can you form any opinion as to what possessed the deceased to get into the pit?—The only reason I can think of was to have a look round the pit and inspect it, to see whether it was wet. It was usual for him to inspect the pits after wet days to see if there was any water in them. To do this it was not absolutely necessary that he should get into the pit, but he could inspect them better by getting into it.

Replying to Mr. Gray, Witness stated that it was not usual to switch off the current merely for inspections, but such inspections would not include the handling of wires.

Mr. Gray: Then the getting into this pit was the correct thing to do?—Witness: As an intelligent workman he should have thought it was not the correct thing to do, and if I had been there I should have warned him against it.

Have you not been in this pit dozens of times?—Yes.

When the current was on?—Sometimes.

Therefore you would not think it a foolhardy thing to do?—No, but an unwise thing.

Yet you have done it dozens of times?—Yes.

There is plenty of room to get into the pit without touching the wires?—Yes, if they are properly adjusted. Fell had put in some new cables about a week previous, and left them in such a manner as to be almost dangerous.

Replying to Mr. Duffield, Witness stated that he had known Fell for some time, but he did not think he was a careless man; he was a very fearless man. He had been a sailor, and was in the habit of doing things on the poles which witness would not attempt.

Witness, continuing, stated that deceased had an accident about four years ago, and after that he was more careful for a time. It was improper for deceased to touch the high tension wires without gloves, and witness did not think that he did so deliberately on the morning of the accident. It might have been done under some sudden impulse.

Mr. Duffield: Was the getting into that pit dangerous?—Witness: I consider it was, in the condition it was in that morning.

Was Fell in a position to know that?—He did know it: I am sure of that.

A Juror: Would the damp make the electricity pass through the covering of the wires?—Witness: Damp will not affect the covering if the rubber insulation is sound.

Do you think he touched a bare wire?—He touched a piece of wire which was imperfectly insulated. The insulation of it had been weakened by water.

A Juror: Had the deceased made some temporary joints?—Witness: Yes, and they were defective.

And it was by touching one of these joints which he had himself made that he met with his death?—Yes.

The Coroner: Do you think that the joints were unsatisfactory?—Witness: Yes.

James Brown, a labourer, in the employ of the company, said: I had been working in the new pit near the Oak Inn with the deceased and a man named "Sonny." The deceased went across to the new pit. Shortly afterwards Garrard ran to me, and said, "Where is Sonny? Teddy has got a shock." I went across at once, and saw the deceased lying at the bottom of the pit with his thumb touching one of the leads. Sparks several inches long were running off his thumb. I knocked his hand off the wire, and pulled hold of his coat and lifted him out as soon as I could.

Mr. Bennell: Had Fell had a shock the day before?—Witness: I have heard that he had one the day before, on the Baddow Road.

The witness Garrard was re-called. He said that when the deceased received the shock he had hold of some leads in one hand, and in some way the other hand came into contact with the high tension lead. Whether this was done accidentally he could not say. He could not understand how Brown could have knocked deceased's hand off the wire, and thought that what Brown saw was the installation on fire.

Mr. A. H. Pott, the chief engineer of the company, said deceased was an excellent workman, but was very careless in his work, and witness had had to caution him lots of times. He had not, however, caught him doing anything absolutely dangerous for some years. On one occasion he saw him handling wires with gloves that were so wet that sparks were crackling down the back of his hand, and on another occasion his hat touched a wire, and sparks crackled all down his back. Deceased merely said that he felt queer, and witness told him to get away from the wire. The pit in which deceased was killed was one of the first two erected in the town, and was passed by Major Cardew before it was used.

Replying to Mr. Gray, Witness stated that he was surprised to hear that Fell had been in the pit, even to inspect it, when the current was on. He did not know that Mr. Entwistle had also been in it; to get into it when it was wet was a very foolhardy thing to do.

The jury, having consulted in private, returned a verdict of accidental death.

Mr. Duffield said the company were exceedingly sorry that this accident had happened. The deceased had been an excellent servant, and the company had trusted him, perhaps, more than they had trusted any other man in their employ.

The Coroner said that, from what he had heard, Fell must have been an excellent servant, although he might have been a little too venturesome.

BUSINESS NOTICES, &c.

The Care of Steam Boilers.—Messrs. R. Hargreaves and Sons, 4, Richmond Terrace, Blackburn, are sole agents for Waddicar's improved patent for preventing formation of scale in steam boilers, and removing dirty waters and sediment. It may be fitted to any part of the boiler considered most convenient. It is connected to the outside of the boiler by a pipe, which allows dirty water to be drawn from the bottom of the boiler at any time when working. The apparatus is constructed to allow of a rotary motion, which prevents the sediment adhering to the bottom of boiler, so that by the regular use of this apparatus the formation of scale is entirely prevented, thereby maintaining the evaporative power and efficiency of the boiler. The apparatus has to be opened three times a day, and one inch of water drawn off each time.

Electrical Wares Exported.

Week Ending May 31st, 1897.

Change of Address.—Mr. R. F. Yorke has removed from 51, West Regent Street to 48, West George Street, Glasgow.

Electric Pumping Plant.—The Better Bed Coal Company, owners of the Fell Greave Colliery, Huddersfield, have for some time experienced delays and difficulties in working the coal owing to the flooding of the mine. To overcome these difficulties the company have ordered an electric motor and pump to be fixed in the workings. The dynamo is compound wound, capable of giving 230 volts and 18 amperes at 1,050 revolutions per minute. It is driven by the hauling engine at bank, and is connected to motor and pump by a pair of 7/18 vulcanised cables at a distance of 400 yards, the motor being geared down from 1,050 revolutions to 60 revolutions by belt and pinion wheels. The motor is of the enclosed type, the lubricators being of the ring pattern. Dynamo and motor have been made by Messrs. Rosling & Appleby, of Bradford. The pump is of the double action type, and has been made by Messrs. G. Kendal and Co., Huddersfield. It is capable of delivering over 1,200 gallons per hour. The work has been carried out under the superintendence of Mr. J. Makin, electrical engineer. The plant has been working for three weeks, and has given entire satisfaction, having overcome serious drawbacks.

Electric Cranes.—It is stated that it is proposed to erect powerful steam or electric cranes at Calais and Dover for the transfer of mails and baggage.

Fined.—The Tudor Accumulator Company, Limited, were fined £3 at Dukinfield Police Court, for a breach of the special rules of the Factory Acts by not providing a bath for the use of their workpeople engaged in dangerous occupations. It was stated by the Government inspector that over a dozen cases of lead-poisoning had occurred among the workpeople.

Harrison, Coles & Co.—Notice has been given that the electric lighting business lately carried on by Harrison, Coles & Co., at Richmond, S.W., will in future be carried on by the Thames Valley Electrical Engineering Company.

Liquidation Notices.—Last Friday's *London Gazette* contains notice to the effect that at a meeting of the Fowler-Waring Cables Company, Limited, held on May 25th at 110, Fenchurch Street, E.C., it was resolved to wind up voluntarily. Mr. Geo. Fleming, of 9, Billiter Street, E.C., and Mr. J. A. Blackwood, of 110, Fenchurch Street, E.C., were appointed liquidators. It will, of course, be remembered that this concern was recently taken over by the Western Electric Company.

A meeting of the Wigston Electrical and Engineering Company, Limited, is to be held at 24, Friar Street, Leicester, on Friday, July 1st, at 3 o'clock, to hear an account of the winding up from the liquidator.

A meeting of the Gas and Oil Engine and Dynamo Company will be held at 1, Queen Street, Cheapside, E.C., on Tuesday, June 28th, at 4 o'clock, to hear an account of the winding up from Mr. Edward Lintott, the liquidator.

At meetings of the Cowper-Coles Zinc Extraction Syndicate, held at the offices, Mellanear, Hayle, Cornwall, on May 5th and 21st, resolutions were passed to the effect that it is desirable to reconstruct the company, and for that purpose that the company wind up voluntary, Mr. T. S. Lowry, of Camborne, being appointed liquidator.

Lists.—Messrs. Washington & Co., of Sowerby Bridge, Yorks, send us an illustrated price list of continuous current electric m tors.

Messrs. Strasser & Rohde, Glashütte in Saxony, have issued a list, showing various micrometers of conveni nt sizes.

Lloyd & Lloyd v. D. & W. Henderson.—On 24th ult. Sheriff Strachan delivered his judgment in this case at Glasgow. The action it will be remembered was taken at the instance of Messrs. Lloyd & Lloyd, of Coombswood, Birmingham, the holders in the United Kingdom of the letters patent of the Benardos system of electric welding, against David and William Henderson & Company, shipbuilders and engineers, Glasgow, to recover the yearly royalties for 1895, 1896, and 1897. The Sheriff assoilzies the defenders from the conclusions of the action, and in the note to the interlocutor his Lordship remarks that the indenture and agreement bear that full license and authority was granted to defenders to use the inventions, and in consideration of the license defenders bound themselves to pay on January 1st, 1893, £200, and on each succeeding January 1st, £200. They paid pursuers in 1893 £200 and in 1894. On December 18th, 1894, they intimated that they were not to use the patented processes any longer. Pursuers insisted on payment whether the processes were used or not, and in this action they sue for the royalties due in 1895, 1896, and 1897. It was maintained by defenders that no valid or effectual license was entered into between the parties. On January 17th, 1893, the license was signed by Mr. Andrew Pitcairn Henderson, a partner of the defenders' firm, with the consent and authority of the other partners, but not in presence of witnesses. In consequence of the plea stated by the pursuers the Sheriff says he directed a case to be prepared and submitted to English counsel for his opinion on the question whether the indenture and minute of agreement was a valid and effectual license according to the law of England. Mr. Danckwerts, an English barrister, has given an opinion thereon to the effect that the deed was not valid or effectual according to the law of England. The pursuers objected to the opinion, but his Lordship considered the objection not well founded. If the validity of the deed was to be determined by the law of Scotland the Sheriff had no doubt it must be held invalid. Not one of the solemnities required by that law in regard to the execution of deeds had been complied with. If the deed was held invalid and ineffectual the action fell.

The Royal Engineers and Electricity.—General Sir Richard Harrison, K.C.B., C.M.G., the newly appointed Inspector-General of Fortifications, paid his first official visit to Brompton Barracks, Chatham, this week, and among his various duties he inspected the Electrical School at St. Mary's Barracks. This school is now very important, as the Royal Engineers are so very deeply connected with this branch of science, and both officers and men daily undergo instruction in all branches of electricity here.

Royal Institution Soirée.—On Friday last, at the Royal Institution *soirée*, the Edison and Swan United Electric Light Company showed the latest 1898 improvements in Ediswan apparatus. These included a patent dry cap lamp for use in damp places, or for outside lighting. The cap is attached by means of a brass disc, and is fastened to the glass bulb by specially prepared cement, which is thoroughly damp proof. Also a patent casing cut-out. Each casing cut-out is provided with four brass thimbles, adapted to the connecting cables, and these are held in position by the form of the porcelain case, without screws, and are easily removable. Provision is made for holding reserve fuses. There was also a patent direct contact high voltage lamp and holder; the holder is wired without being taken to pieces; the wires pass direct to the spring contact pieces which enter cavities in the lamp socket; there is claimed to be no possibility of short circuiting, and the work of wiring is greatly facilitated. Also the patent anti-shock switch for high voltage, an improved "Tumler" pattern, with patent enamel liner, and the patent anti-shock holder for high voltage, an improved "S" holder, with patent enamel liner.

Smoke Nuisance.—At the Greenwich Police Court on Thursday last week, the summons brought against the Crystal Palace District Electric Supply Company, Limited, and Mr. B. G. Blanchard, their secretary, of Springfield Works, Wells Road, Sydenham, by the Lewisham District Board of Works for an abatement of a smoke nuisance was adjourned *sine die* on payment of five guineas costs by the defendants, it being stated by Mr. E. Wright, clerk to the Board, that the nuisance had been abated.

The Metropolitan Electric Supply Company was, on 26th ult., again summoned at the Marylebone Police Court, at the instance of the Paddington Vestry, for causing a smoke nuisance from their Amberley Road station. After discussion the summons was adjourned *sine die*

At Clerkenwell on Tuesday Messrs. Walter Scott and Co. were summoned for using, at the Chancery Lane Station of the Central London Railway, a furnace and steam engine which were not so constructed as to consume the smoke arising therefrom. The Holborn District Board of Works prosecuted. The magistrate, after hearing evidence and arguments, dismissed the summons, holding that the furnaces were, as far as possible, constructed so as to consume their own smoke.

Testing Magnetic Steel in Bulk.—Mr. Robert Jenkins, of 88, Bishopsgate Street, E.C., writes as follows:—"I see in this week's REVIEW a communication headed 'Testing of Magnetic Steel in Bulk,' wherein a reference is made to the output of the 'South Staffordshire Steel and Ingot Company, Limited.' This name is incorrect. The firm whose analysis and whose output are given is that of Messrs. Alfred Hickman, Limited, of the Staffordshire Steel and Ingot Iron Works, Bilston, for whom I act as agent in electrical business."

Veritys, Limited, v. Sharp.—With reference to the above in our last week's issue, Mr. Sidney Sharp, of 34, Victoria Street, Westminster, desires us to state that he does not carry on contracting work, and that the defendant in this case is not in any way connected with him, or known by him. We have much pleasure in giving publicity to this disclaimer.

ELECTRIC LIGHTING NOTES.

Aberdeen.—Mr. Blackman has resigned the position of electrical engineer to the Council, he having secured an appointment as electrical engineer to the Poplar Board of Works. A successor is to be advertised for at £225 per annum.

Asylum Lighting.—The Richmond District Asylum electric lighting scheme is not to be proceeded with until it is known when the Dublin Corporation new electricity works will be likely to be ready.

Bangor.—The Lighting Committee has reported that as the area of the fields adjoining the gas works was too restricted for the erection of electric light works, gasometer, and offices combined, and would not allow of any extension in the future, if found necessary, it is highly advisable that the land adjoining the gas works should be devoted to gas business only, and that the electric lighting works be erected on land at the corner of Dean Street. They advised the purchase of a site there, and Lord Penrhyn had expressed his willingness to sell the land to them. The Council had a discussion on the point, and finally the minutes were adopted.

Bath.—The Electric Light Committee has purchased for £90 the dynamo and 30 lamps which they had had on hire from the old company. Mr. Hammond remarked that if they had taken them over in the first place, they would have had to pay £1,950. The contractors for the new engines are arranging for their erection to be commenced on June 6th, and the first set of new plant, it is anticipated, will be ready by July.

Bethnal Green.—The Vestry has been advised on the electric lighting question by Prof. Robinson, who foresees a large measure of success for an installation. The County of London and Brush Provincial Electric Light Company's letter *re* a scheme was acknowledged by the Vestry without discussion. Prof. Robinson advises the Vestry to carry out an installation for 5,000 lamps of 16 C.P. This would entail a capital expenditure of £33,000, exclusive of land. Of this sum, £4,100 would be spent upon buildings, £10,500 on mains, £2,400 on house connections, and £11,500 for machinery. Prof. Robinson has no doubt whatever that the undertaking will at once prove remunerative, and he puts down the profit at the end of the first year at £200, at the end of the second year at £350, and at the end of the third year at £1,010. The charge for private consumers is put down at 6d. for the first year, and 5d. afterwards. The report says that the profits might with advantage be applied towards improving the public lighting. Two schemes are submitted. It is estimated that to provide arc lamps for 9,000 yards of main street would cost £16 per lamp, as compared with £3 8s. for the present gas lamps. A large number of standards would be displaced, and the increased cost, therefore, would be £1,090 per annum for increasing the total candle-power from 2,000 to 6,500 before midnight, and to 3,200 after midnight. If, on the other hand, two incandescent burners were substituted for the present gas burners the increased cost would be £278, and the illumination would be increased from a total of 2,750 candle-power to 7,040. The extra cost could ultimately be met out of the profit on the general supply, and extra lamps of higher power placed in important streets. The change would be advantageous, not only in the lighting, but because it would transfer revenue from the gas company to the electricity department. The professor thinks that refuse destruction would lead to a saving of nearly £1,000 a year on the present arrangement.

Birmingham.—At a meeting of the General Purposes Committee on 25th ult., the report of the sub-committee appointed to consider the projected purchase of the electric lighting undertaking was fully discussed. It was resolved to recommend the Council to accept the terms provisionally indicated on behalf of the company in whom the electric lighting is at present vested. These terms fix the price of the £5 shares at £10 10s., their value in the open market. Apart from the price, there are various matters of detail outstanding.

Blackpool.—A Local Government Board inquiry was held at Blackpool on Tuesday regarding an application on the part of the Corporation for power to borrow a further sum of £40,000 for electric lighting extensions. Mr. Quinn, the electrical engineer, said that the £40,000 would only meet immediate demands, and if the demand for the current continued, another £40,000 would be asked for.

Bolton.—At the monthly meeting of the Town Council on Wednesday, Councillor Panton, as chairman of the Electricity Committee, called attention to a report of the engineer (Mr. Arthur Ellis), in which that official recommended a change from the alternating system to the continuous current for the central portions of the town. The subject, he said, was of considerable importance, and he was prepared to have the matter referred back, so that members of the Council might be placed in possession of the report and the estimates. He added that one of the advantages in changing would be that the loss in generating would only be 10 or 12 per cent. as against 25 to 30 per cent. under the alternating system. Another advantage was, that they would be able to extend and supply power for all purposes. The matter was referred back, so that the chairman's suggestion might be carried out. In his report the engineer says that the question of extensions for the coming year has had his careful consideration, and he is firmly of opinion that it is not advisable to extend on the present system, but to adopt the continuous current for the central portions of the town. By this means they will get rid of a great source of trouble and danger, as well as a great loss in the transformers, by being able to run direct from the works to the consumers' premises, with nothing in between to go wrong. In regard to the proposal to use electricity for tramway traction, Mr. Ellis lays emphasis on the fact that, by changing to the continuous current, the lighting plant could be so utilised for this purpose, the plant being made interchangeable. This would mean that the Corporation would not have the same amount of spare plant idle. The Electricity Committee have approved of the recommendations.

Bray.—A number of electric lights are to be placed along the sea wall marine promenade for the ensuing season.

Brighouse.—Mr. J. W. Garside, Brighouse, has been appointed electrical engineer to the Town Council.

Bulawayo.—On April 21st the new lamps on the suburban stands were lighted for the first time. The current is now kept on all night. The electric light company is now putting meters in the houses of all consumers, and when these are all installed the charge will be 2s. per Board of Trade unit, a reduction of 25 per cent. There are now some 800 private lights being used in the town, and 65 street lights. Only one dynamo is being used, the other being kept in reserve for emergencies. The engines are by Macintosh and Seymour. About six tons of red wood, supplied by the Timber Supply Company, are burnt nightly, which fuel is delivered alongside the building on Willoughby's special siding. It has been proved that "mapani" wood is no good as fuel.

Canterbury.—The Corporation has received a considerable number of orders for the installation of the electric light. The laying of the mains is being rapidly carried out, and it is expected that the public lighting will be completed by November.

Cardiff.—The Lighting and Electrical Committee decided on 26th ult. to reduce the prices for current from 6d. per unit for the first two hours, and 3½d. per unit afterwards, to 6d. for the first hour, and 3d. per unit afterwards. Increased consumption is expected to well make up for the consequent reduction in revenue.

China.—The *London and China Telegraph* says that Yang, a Taotai, has been commissioned to manage the electric light department for the Chinese Bund. He has obtained $10,000 from the Shanghai Taotai's Treasury for the purchase of machinery, and also the assistance of a military official in the management of affairs.

Conway.—On Thursday last week the Mayor of Conway and several members of the Cowlyd Water Board, with Mr. Marks, of Llandudno, as professional adviser, visited the board's property of the Turbine, near Cowlyd Lake, to report as to utilising the water power for the purpose of generating electricity. The Mayor stated that the result of the inspection quite warranted the action of the board, and that the property is likely to lead to important developments.

Croydon.—The Local Government Board has sanctioned loans for the electric lighting extension.

Darwen.—On 25th ult. a Local Government Board inquiry was held *re* the proposal to borrow £30,000 for electric lighting.

Derby.—The borough electrical engineer having written to the Guardians asking them to consider the advantages to be secured by using electric lighting at the Workhouse, the matter has been referred to the House Committee.

Dundee.—The Gas and Finance Committees have reported that in the electric department there has been a surplus of £1,328 4s. 3d. The charge for current up to 20 units is to be reduced from 7s. 6d. to 6s. 8d., and the supply above 20 units will be charged at the rate of 4d., being ½d. under last year's price. Current for power purposes will be supplied at 2½d. per unit.

Gloucester.—At the last meeting of the City Council the electric light question again came up for discussion. The installation has some time ago been decided upon, and plans for the works, together with dust destructor, were drawn up by Mr. Hammond and approved. The site was the chief difficulty, and this was the matter which occupied the Council's attention last week.

Hampstead.—Last week Mr. A. P. Johnson, the clerk, reported to the Vestry that the profits on the electric lighting undertaking for the past year had exceeded all expectations. The revenue for the year amounted to £8,081 0s. 9d. They had paid £2,960 8s. 3d. interest on capital, and they had also repaid £1,187 12s. 10d. instalments of capital, leaving the net profit £3,905 3s. 4d. Sir Henry Harben, the chairman, pointed out that, if the Vestry were a trading corporation, and had not to repay the capital by instalments, the profits for the year to rank as dividends would exceed £5,000. The total amount of capital expended up to the present is £100,167.

The Vestry has resolved that, "in view of the fact that the electric arc lighting of Haverstock Hill, Rosslyn Hill, High Street, and the southern portion of Heath Street is now satisfactorily completed, the Lighting Committee be instructed to bring up a report as early as possible upon the question of lighting Heath Street, north of its junction with High Street, by means of electricity, such question having been deferred by the Committee from December 13th last."

Hotel Lighting.—The order for the complete plant and wiring of the St. Anne's Hotel, St. Anne's-on-Sea, has been given to the National Electric Free Wiring Company, Limited, who have also secured the orders for the wiring of Jones's Hotel, Suffolk Street, S.W., and the residence of Mr. Ernest Franklin, 50, Porchester Terrace, W.

Hull.—There has been considerable delay in the completion of the Sculcoates Lane electricity station, but it is probably to be finished early in July. The chairman and deputy-chairman of the Electric Lighting Committee and the electrical engineer are to attend the Municipal Electrical Association Convention next week. The mains are to be extended in certain thoroughfares. With regard to the subway proposed to be erected by the Gas Committee under Queen's Dock Basin, the electrical engineer advises that owing to the distance from the line of main feeders, it would not be advantageous to the Electric Light Committee to join in the affair.

Kilmallock.—This small Irish town, having a population of about 1,000, is lighted electrically. Mr. J. J. O'Sullivan, J.P., who some years ago had an installation put down for lighting his mineral water factory, has now lighted the business houses and streets. There are nine public lamps. The plant was supplied by the Edison & Swan United Company, and consists of an 18-H.P. horizontal engine and a dynamo giving 60 amperes at 200 volts.

Lancaster.—The budget on the electric light department of the Lancaster Corporation, as presented at the monthly meeting on Wednesday, May 25th, was considered to be very satisfactory. The committee reported a profit of £598 7s. 2d. on the year, and Mr. Johnson, the engineer, submitted the comparative statement for the years ending March 25th, 1897, and March 25th, 1898, as follows:—

CURRENT SOLD, &c.

	March, 1897.	March, 1898.
Current supplied to public lamps ...	20,580	26,752
" " private consumers	85,545	120,423
" " used at works ...	2,923	3,344
	109,050	150,519

Generation of electricity.	March, 1897.			Cost per unit. 1897.	March, 1898.			Cost per unit. 1898.
	£	s.	d.	Pence.	£	s.	d.	Pence.
Coal, oil, waste, water and sundries...	472	15	3	1 04	581	0	7	92
Wages at generating station	332	10	5	·73	371	1	9	·59
Distributing	25	1	5	·05	22	12	1	·03
Public lamps	67	16	1	·14	69	2	11	·11
Rents, rates, royalties ...	121	1	10	·26	96	19	11	·15
Management, salaries, and sundries...	174	5	4	·38	194	17	1	·31
	1,193	10	4	2·60	1,835	14	4	2·11
				...				·49 decrease.

INCOME.

	March, 1897. £	s.	d.	March, 1898. £	s.	d.
Sale of current, less discounts ...	1,710	10	8	2,382	9	10
Rent of meters	119	6	9	1	9	3
Public lighting	384	13	7	504	19	6
Miscellaneous	12	10	0	13	0	0
	£2,227	1	0	£2,901	18	7

Mr. Clough (the borough accountant) reported that the electricity department has made considerable progress, the balance transferred to the district fund being £510 in excess of the previous year. The financial results, so far, have been:—

	£	s.	d.	£	s.	d.
Loss 1894-5	373	11	7			
„ 1895-6	539	8	11			
				913	0	6
Profit 1896-7	87	19	8			
„ 1897-8	598	7	2			
				686	6	10
Net loss				226	13	8

It was estimated that there would have been a profit on the year amounting to £260 1s. 6d., and it is pleasing to have to report that this department has done better than anticipated. The comparative figures are as follows, shillings and pence omitted:—

	1895-6.	1896-7.	1897-8.
Income:—	£	£	£
Sale of current, less discount ...	1,337	1,795	2,494
Rent of meters...	87	119	1
Public lighting...	366	384	504
Sale and repairs of lamps, &c. ...	352	248	273
Expenditure:—			
Manufacture of electricity	919	805	952
Dist. and management...	611	447	480
Rents, royalties, and taxes	52	97	84
Debt redemption, interest on loans, &c., or contribution to stock dividends account	992	992	992

Capital expenditure upon the electricity works amounts to £24,211 4s. 4d. The increase during the year was £1,313 16s. 2d., but the premiums obtained on the Corporation 3 per cent. redeemable stock, less compensation to mortgagees, brought forward from last year, reduces this amount by £319 17s. 9d. Amount set aside for redemption of stock during the year was £831 9s. 3d., and the liability on March 25th amounted to £24,680 2s. 4d., the same as the previous year. Mr. Hall moved the confirmation of the minutes of the Electricity Committee, drawing attention to the large increase of electricity during the year, which the Committee were prepared to meet by putting down fresh plant. The comparative statement was well worth considering, because it showed at once the large increase in the consumption of electricity. The cost of production was very favourable indeed in comparison with other low tension stations in the country. He believed they stood the highest in England under the low tension system in regard to the low price at which they produced electricity. He hoped they would be able to keep that position. Mr. Heald seconded, and the minutes were confirmed.

Leigh.—The District Council has decided to apply to the Local Government Board for sanction to borrow various sums, including £10,500 for proposed electricity works.

Liverpool.—The Lighting Committee has resolved upon extension of mains in several thoroughfares at a cost of nearly £700.

London.—At last week's Court of Common Council Mr. Brooke Hitching asked the chairman of the Streets Committee if the law officers had reported on the reference as to whether the Corporation was able to erect and maintain a municipal electric lighting station, having regard to the agreement which had been entered into by the Corporation with the City of London Electric Lighting Company; and further, whether the law officers were unanimous in their opinion that the erection of such a station would be a breach of the agreement in question. No reply to the question was forthcoming.

The Board of Trade has issued provisional electric lighting orders to the Bermondsey and Marylebone Vestries for the whole area of their respective districts.

Mauritius.—Mr. F. J. Warden-Stevens has been appointed to prepare a scheme for the electric lighting of Port Louis, Mauritius.

Morecambe.—At a special meeting of the District Council on May 23rd, Mr. Krauss (the contractor for the installation of electric lamps and pillars on the Promenade), wrote asking to be allowed to put up the arc lamps and pillars on the Bare Promenade. The Council refused, informing Mr. Krauss that the time had already passed when, under his contract, he should have handed over the Promenade to the District Council, completed. The delay was causing them considerable inconvenience, for which they held him responsible. Notice was given to Mr. Krauss that the Council would themselves proceed to lay the cables and put up the arc lamps and pillars after 14 days from that date.

Pembroke.—A Local Government Board inquiry is to be held to-morrow, June 4th, regarding the Township's Commissioners' proposal to raise £33,000 for electric lighting.

Poplar.—The Board of Guardians has adopted a report of its Electric Lighting Committee with reference to the hot and cold water and steam supply at the workhouse, and embodying schemes for lighting the workhouse and the offices at North Street by electricity. Mr. Warden-Stevens' original scheme was adopted, and he has been instructed to prepare the necessary plans and specifications. Application is to be made to the Local Government Board for a £9,000 loan for the purpose.

Portsmouth.—The balance-sheet and revenue accounts of the Electric Lighting Committee for the year ending March 31st last, which was issued on Thursday last week, shows total receipts amounting to £16,265 3s., and an expenditure of £9,469 13s. 9d. This leaves a gross balance of £6,795 9s. 3d. on the year's working. Of this sum the Committee carry £6,750 to net revenue account, leaving a balance of £45 9s. 3d. to be carried forward. Out of the £6,750 the Committee have paid £3,180 19s. 4d. for interest of borrowed capital, and £2,793 13s. 7d. towards redemption of loans. No sum is written off to provide a reserve fund to maintain and renew the machinery.

Provisional Orders.—The electric lighting provisional orders relating to Batley and Ossett were confirmed in the House of Commons on Monday last week.

Saltburn.—Messrs. Burstall & Monkhouse are preparing a report on electric lighting for the District Council. There are two schemes—one promoted by the Cleveland and South Durham Assets Company, and the other by the Urban Council.

Shoreditch.—Mr. C. N. Russell, the chief electrical engineer, has issued a list of streets in which the Vestry's supply mains are laid, or will be laid within the next few weeks. The list is as follows, the mains in some cases being laid on one side, and in others on both sides of the street:—Bateman's Row, Brunswick Place, Cropley Street, City Road, Commercial Street, Curtain Road, Charlotte Street, Charles Square, Church Street (to boundary), Calvert Avenue, Coronet Street, East Road, Eagle Wharf Road, Great Eastern Street, Garden Walk, Hackney Road, Hoxton Street, Hoxton Square, High Street (to boundary), Holywell Lane, Huntington Street, Kingsland Road, Leonard Street (Sq. to boundary), Motley Street, New North Road (from East Road to Eagle Wharf Road), New North Road (Pitfield Street to East Road), New Inn Yard, Nile Street, Old Street (from City Road to Pitfield Street), Old Street (Pitfield Street to High Street), Paul Street and Wilson Street, Pitfield Street, Rivington Street, Rufus Street, Sun Street, Shepherdess Walk, Tabernacle Street (to boundary), Wenlock Street, Worship Street, Ware Street.

Tunbridge Wells.—It is stated that the surplus for the year ending March 31st on the electric light undertaking at Tunbridge Wells is close upon £2,400.

Twickenham.—The District Council have had laid before them proposals by Edmundson's Electricity Corporation, of Broad Sanctuary Chambers, Westminster, to light the town by electricity. The Corporation offer to form a local company, free of all expense to the Council, to light the districts of Twickenham and Teddington by electricity. They would consent to the inclusion in the order to be obtained from the Board of Trade of a clause that light to be used for the streets or public buildings should be supplied at 3d. per unit, for private dwellings 7d. per unit, and that the Council should have the option of taking over the undertaking at the end of 14 years. The communication was referred to a special committee, but members expressed the view that the Council should be careful how they tied themselves down, for there might be a time coming when they could destroy dust and manufacture electric light at the same time.

Wandsworth.—The Board of Works has given consent to the application of the County of London and Brush Provincial Company to lay mains in Lower Richmond Road, Putney.

Westgate.—On 21st ult. Major Cardew, R.E., resumed the public inquiry opened on the 13th ult. in the matter of the application by the Isle of Thanet Rural District Council for a provisional order. A good deal of evidence was given, and the Major said he would report in due course.

Whitechapel.—We learn that the District Board, on 24th ult., decided to lay down its own electric light installation for the district.

Wimbledon.—It is expected that the electricity works will be completed about March next year, and the District Council is inviting intending consumers to lodge their applications for current. Mains will be laid in every street.

ELECTRIC TRACTION AND MOTIVE POWER NOTES.

Birmingham.—The report of the Public Works Committee recommends the City Council to adopt overhead electric traction upon the Sparkhill and Small Heath routes. There has been a serious divergence of opinion in the committee with regard to this proposal, which was only adopted by the bare majority of one, five being in favour of permission being granted and four against. It should be understood that the committee still retain their favourable opinion towards the conduit system, but the utter inability to come to terms led to such a deadlock that they felt compelled to adopt some other means of settling the difficulty, which, in its quiescent state, was causing the public no small amount of inconvenience. On the routes mentioned there was a strong growing feeling of antipathy towards the steam trams, and in view of this the larger half of the committee supported the proposal the Council will be asked to adopt. It must be clearly understood, says the *Birmingham Post*, that this is merely a four years' trial of the overhead system, which has been adopted in several places where the tramways have been municipalised. If, at the end of that period, the overhead method does not meet with the approval of the Corporation, we understand the company have undertaken to remove it at their own expense, but, in the meanwhile, members of the Public Works Committee feel strongly that the experiment in question will be preferable to the continuance of the present system. In addition to this recommendation the report includes an offer of Messrs. Dick, Kerr and Co., Ltd. The whole matter will be discussed on Tuesday next, June 7th. Messrs. Dick, Kerr's offer is for the provision of a tram service upon roads in the city along which there is at present no such accommodation. They undertake to adopt either the underground electric conduit or the cable system of traction as may be found suitable to the various routes; they stipulate that the term of concession must be for 21 years, and agree that if the Corporation purchase the business of the Birmingham Electric Lighting Company, as is proposed, they will become customers for their electric power. In lieu of rent a profit-sharing arrangement is suggested, contingent upon paying 5 per cent. interest upon the capital of any company that may be formed, and the laying aside of a sufficient annual sum to provide for a sinking fund for the whole of the capital. Finally, at the expiration of the term of concession the whole of the lines within the city would revert to the Corporation without payment. It is understood that the chairman of the Tramways Company does not now adhere to his recent statement that the Corporation had given verbal permission to instal the overhead trolley system in certain parts.

Brierley Hill.—Last week the first sod was turned at Round Oak in excavating the foundations for the power station of the British Electric Traction Company.

Dublin.—Early last Friday morning a successful trial trip was made on the newly completed section of the electric tram line between Haddington Road and Nelson's Pillar. Mr. Astrom, the electrical engineer of the Dublin United Tramways Company, accompanied by other officials of the company, ran one of the motor cars from Haddington Road into O'Connell Street *viâ* Merrion Square, Westland Row, Great Brunswick Street, and D'Olier Street, This section was to be open for traffic this week. In this line centre poles are placed throughout the entire distance, but otherwise the installation is exactly the same as that on the Clontarf section. The Board of Trade inspection was expected to take place this week. The electrical equipment of the various other lines is proceeding rapidly. Poles are now being erected along the north quays, where the cables are also being laid. The laying of the underground conduits is being pushed forward rapidly all over the city. The great central power station at Ringsend is progressing quickly. Already the foundation excavations have been made, and the work of erection commenced. The line connecting Rathmines with the sea is now almost constructed. Pending the electrical equipment of this line, which will be shortly taken in hand, it will be worked, says the *Dublin Nation*, by horse haulage.

Dudley.—The contract for the new electrical power station at Brierley Hill has been secured by Messrs. J. H. Whittaker and Co., Dudley. The contract amounts to £7,000. The work has to be completed in about four months.

Glasgow and Paisley.—A sub-committee of the Upper District Committee recently had a conference with the Glasgow Tramway Committee *re* the proposed construction of electric tramways in Paisley and district. The members of sub-committee, having considered the proposals by Glasgow, resolved to report that, in their opinion, it would be preferable to enter into an arrangement with the Glasgow Corporation in connection with the construction of tramways on the Paisley Road, rather than with the British Electric Traction or other private company, who, moreover, it is understood, propose to lay, in the first instance at least, only a single line of rails on the road, to which the sub-committee entertain the strongest objection. The sub-committee also resolved to request a conference with representatives of the burgh of Paisley regarding the proposal of the British Electric Traction Company to construct a tramway on the Leith Road, between the burghs of Paisley and Johnstone, to be held either at Glasgow on Wednesday, 25th curt., or at Paisley on Thursday, 26th curt., as may be most convenient for the Paisley representatives.

Gorton.—The Electric Lighting Committee has been considering the Manchester Corporation's proposal regarding the working of the tramways. The proposals were that the authorities in the out-townships should acquire the lines in their respective districts, and provide electric energy and the necessary equipment for the working of the tramways on the same system and at the same voltage as proposed to be adopted in Manchester, at their own cost. Such an arrangement, if agreed upon, was subject to a revision at the end of three years' working. The Committee, whose proceedings were confirmed by the Council, decided not to accept the proposals. The chairman of the General Purposes Committee and the clerk subsequently met representatives of the Denton District Council and the British Electric Traction Company. Arrangements have been made for a conference to be held at an early date between the members of the Gorton Council and the representatives of the district upon the Lancashire County Council.

Helston to Lizard.—The Board of Trade has issued the modified and now confirmed order made by the Light Railway Commissioners authorising the construction of a light railway, commencing by a junction with the Helston line of the Great Western Railway at its termination, and terminating at the Lizard, a distance of over 11 miles. Clauses are inserted to enable the company to work the line by steam, mechanical, or electric power.

Kew Bridge.—The Middlesex County Council at its meeting on Thursday last week, resolved to oppose the proposals of the London United Tramways Company to carry electric trams over Kew Bridge. They, however, acknowledged the receipt from the joint Kew Bridge Building Committee of the following recommendation:—"That it be a recommendation to the County Councils of Middlesex and Surrey, that a double line of tramway be allowed over the proposed new bridge, subject to the tramway company paying the whole cost of the widening of the proposed bridge and its approaches, in accordance with the suggestion of Sir John Wolfe Barry, and subject to other conditions being satisfactory as regards the method of working, maintenance, and in other respects."

Kirkcaldy.—Prof. Kennedy has been collecting further information locally for completing his report on the proposed electric light and traction scheme.

Leeds.—On Tuesday night a guard wire broke when a car was running along North Street toward Briggate.

Llanfair and Beaumaris.—The Light Railway Commissioners have come to the decision, respecting the above line, that they would not be justified in submitting to the Board of Trade an order authorising the construction of the line. The decision has caused the greatest disappointment in the Menai Bridge and Beaumaris and Llandegfan districts, through which it was intended to run the line.

Middlesborough.—The Streets Committee on 27th ult. discussed the laying of the track for the new electric tramway service, the ground of complaint being that the scored brick paving was considerably above the level of the rails. At a previous meeting a resolution was passed allowing three months in which to give the bricks opportunity to settle, upon an undertaking that if at the end of that time they were not level with the rails the company would make them so. Last week it was resolved that the former resolution be rescinded, and that the Corporation consistently oppose the granting of the license till the pavement is made on a level with the rails.

Rochester, Chatham and Gillingham.—The Light Railway Commissioners will continue at Chatham, on Monday, June 6th, their adjourned public inquiry into the application which has been made by the Rochester, Chatham, Gillingham and District Electric Railways Company, Limited.

Southall.—The District Council last week considered the proposals of the company in regard to its application for an order to construct a light electric railway in the Council's district. On Friday last the Council interviewed Mr. George White, chairman of the London United Tramways, Ltd., and Mr. J. Clifton Robinson, managing director, and subsequently decided *nem. con.* to sanction and approve the scheme on the following conditions: That the pattern and positions of the trolley wire standards be approved by the Council; that the company wood-pave its track through the High Street (about a quarter of a mile); that the fares be no more than 6d. from Shepherd's Bush to Uxbridge, 4d. from Shepherd's Bush to Southall, and 2d. from Southall to Uxbridge, workmen's fares to be not more than half the ordinary fares; and that the Council have the use of the trolley wire standards for lighting or other purposes.

Southend.—The Corporation of Southend-on-Sea have just let a contract to Messrs. Alexander Penney & Co., of London, for the provision of a siding and passing place in connection with the electric tramway on the pier. This has been necessitated owing to the almost phenomenal growth of the traffic on the tram. The whole length of this tramway is one mile. It has a gauge of 3 feet 6 inches, and the weight of the rails is 45 lbs. per yard. These are secured to wooden longitudinal deck beams by steel clips and ⅝th inch coach screws. The joints of the rails consist of ordinary fish-plates and bolts with copper strip bonds. The line is straight with equal forked siding at the pier head. The power station is arranged under the pier entrance. It is provided with a 12 H.P. horizontal engine and locomotive type boiler by Messrs. Davey Paxman & Co., of Colchester. There is a Crompton dynamo of 200 volts giving out 100 amperes. The current is carried direct from the dynamo along a centre rail, the car rails taking the return current. The traffic is worked by means of three trains, each consisting of a like number of open or summer cars. The motor car is fitted with a Crompton 10 H.P. motor geared by means of a phosphor bronze spur gearing on the hind axle. In the busy season a 15-minute service is worked, and, of course, with the extra facilities provided by the new siding and passing place the service will be accelerated. This work, it is expected, will be completed in two or three weeks' time. Messrs. Penney are also building an improved tram of three cars. The speed is limited to 8 miles per hour, and the line appears to admirably answer its purpose. The traffic is well managed by Capt. Kelly, whilst the machinery is under the control of Mr. Frank Norton; Mr. F. H. Gill is in charge of the new works, and Mr. E. Martin is resident engineer.

The Spen Valley.—The proposal to construct an electric tramway in the Spen Valley of Yorkshire has speedily taken shape, and before long some definite steps will in all probability be taken. As a result of the visits paid to the district by a representative of the British Electric Traction Company a letter has been received by the various authorities concerned, in which the company says that it proposes to take the necessary preliminary step with a view to obtaining the necessary powers for constructing an electric tramway connecting Ravensthorpe, Dewsbury, Staincliffe, Heckmondwicke, Liversedge, and Cleckheaton. "We propose to proceed under the Light Railways Act, 1896, as," adds the company, "under this Act by the local inquiry held by the commissioners better facilities are afforded to the local authorities for the discussion of the whole question than is the case under the Tramway Act. Under this Act the application can be made in November next and the intervening time will give us ample opportunity to discuss the whole details of the scheme with you." The letter has not been discussed by the authorities yet, but it has been relegated to the various committees. The line will be some 12 or 13 miles in length.

Sunderland.—The Council has adopted a report of the Tramways Committee, recommending that a deputation be appointed to visit Hamburg, Brussels and Leeds, and to report to the Council upon the systems of electrical or mechanical traction in vogue there.

Surrey and Middlesex Light Railways.—The opposition which from the first was displayed in Richmond towards the London United Tramway Company's proposed light railway over Richmond Hill to Kingston has not in any way diminished. Other local authorities have followed the lead of the Richmond Town Council in giving notice of intended opposition. The Ham District Council at their last meeting discussed the proposal, and came to the conclusion that the railway would be of no benefit to Ham, and it would be an obstruction to traffic, that it would be dangerous owing to the steep gradient running down through Petersham Wood from Richmond Hill, and that the narrowness of the roads at places would increase the danger. The result of the debate was the passing unanimously of a resolution to oppose. At the Kingston Town Council the points urged against the proposal were that light railways were intended for agricultural districts, not for towns like Richmond and Kingston, that no provision was made for the purchase of the undertaking by the Corporation, that a monopoly should not be tolerated in the borough, that it would injure the residential district, that there would be danger on the roads, that the district was well served in means of communication, and that if tramways were wanted the Corporation should provide them. It was also argued that the Town Council should oppose with a view of getting roads widened, and particularly securing the reconstruction of of Kingston Bridge over which the line would pass into Middlesex. A recommendation to oppose was unanimously agreed to. At the meeting of the Middlesex County Council also it was agreed without discussion to oppose the order, inasmuch as it related to the County of Middlesex.

Swansea.—The British Electric Traction Company, into whose possession the Swansea Tramways recently passed, commenced on Tuesday to relay the system and to equip it for electrical traction.

TELEGRAPH AND TELEPHONE NOTES.

The Alternative Cable to the Cape.—In the Legislative Assembly at Cape Town last Friday, Sir J. Gordon Sprigg intimated, that, subject to the approval of Parliament, the Government agreed to construct the land wires for the "all British cable from England to Australia," and that subject to a reduction of cable rates the Government favoured a further subsidy to the Eastern Telegraph Company. Mr. Merriman pointed out that Mr. Hofmeyr was in favour of the proposition that the cable should be owned by the Cape and the Imperial Governments, thus abolishing the company's monopoly. The matter will come up for discussion at an early date. In the meantime we learn that the cable steamer *John Pender* is about to sail from the Cape for England, with instructions to take soundings along the proposed cable route on her voyage home. The length of the proposed cable will be about the same as that projected across the Pacific, and, judging from the few soundings already taken on the southern portion of the proposed line, the depths will be about the same as those found in the Pacific along the intended cable route. It is to be hoped that the survey by the ss. *John Pender* will not occupy so long as the cable route survey still being carried on by the Admiralty across the Pacific, which has been going on for about ten years. There is some talk of extending the Cape cable on to Australia; but this idea does not meet with much encouragement from the Australian Premiers. At the Hobart Conference it was pointed out that there was no willingness shown by the telegraph companies to reduce rates to the public, in spite of the fact that last year alone, which was a year of reduced traffic, the money collected was £50,000 in excess of the guaranteed amount, yet the company was only prepared with a concession amounting to about £4,000, which was wholly inadequate. In view of the large subsidies the company had received during the past 20 years it would have been reasonable to have offered to take public messages at 4s., which would have reduced the company's takings to about the guaranteed amount. The company was disinclined to do anything except on the understanding that the colonies entered into the new project of an alternative route *viâ* the Cape. Unless it could be shown that the Cape route afforded Australia advantages beyond strategic and sentimental ones from an Empire point of view, the conference could not recommend the respective colonies to accept the arrangement. That was the view taken at the meeting of premiers. They would not subsidise the Cape cable. The better alternative route would be *viâ* Canada. He moved—"That in the absence of a satisfactory proposal from the E.E. Company and of any proposals at all except on the basis of an alternative cable *viâ* Africa, this conference is unable to make any fresh arrangement with that company." Mr. Duffy seconded the motion. He said no company must be allowed to fetter Australia with a monopoly. The motion was put and passed. Mr. Dickson advocated the Pacific cable route as tending to reduce charges and be all in British territory. He moved a motion in favour of that consummation as speedily as possible, and communications be made with Canada and England, that if they will contribute one-third each Australia would give the other third. Mr. Duffy seconded. The motion was put and passed.

The New Gotland Cable.—Messrs. W. T. Henley's Telegraph Works Company completed the laying of this cable, connecting Gotland with Sandon, Hufvudskor, Ornon, and Dalaro on the 1st inst. The cable steamer *H. C. Oersted* returned to Copenhagen the same evening.

The Pacific Cable.—The *Times* Ottawa correspondent says that on the 26th ult. a discussion took place in the Canadian House of Commons on the Pacific Cable question. Members on both sides of the House urged the Government to endeavour to push forward the project. Sir R. Cartwright, for the Government, said that the people of Canada were far less directly interested in the project than the Australasian colonies; and, as the Imperial authorities had contributed heavily to Imperial projects by constructing the Canadian Pacific Railway of Canada, he thought they should not be asked to contribute beyond a reasonable share. The negotiations had not resulted in action, yet the Government has not abandoned the hope of a successful issue.

The Telephone Agitation.—The conference between the London County Council and representatives of Metropolitan local authorities has been postponed till June 10th. The Select Parliamentary Committee will meet again on Tuesday next, 7th inst., and continue the examination of Mr. J. C. Lamb, C.B.

Telephones in Switzerland.—There are some interesting remarks on the success of the telephone system under State management in the latest Swiss Consular report. The number of members on the Berne Exchange is 2,025, the subscription being originally fixed at £4 16s. for the first year, £4 for the second, and £3 4s. for the third and subsequent years, the subscriber being entitled to 800 messages per annum. The rates, says a financial contemporary, have since been reduced to £4, £2 16s. and £1 12s. respectively, with an additional charge of 5 centimes (½d.) for every message. The number of central stations is 225, and the total number of stations, counting the dwellings or offices where instruments for the use of subscribers are placed, amounted to 23,671.

CONTRACTS OPEN AND CLOSED.

OPEN.

Belfast.—June 6th. The Harbour Commissioners are inviting tenders for the supply of three belt-driven, continuous current, series wound dynamos, to give 15 amperes, 2,850 volts, at 800 revolutions per minute, for 18 hours' continuous running without undue heating. Harbour engineer, Mr. G. F. L. Giles, from whom particulars may be obtained. See our "Official Notices" May 27th.

Belgium.—June 10th. The Provincial Government Authorities in Brussels are inviting tenders for an installation of electric lighting in the Bibliotheque Royale, in the Place du Musée, Brussels. Tenders to be sent to Le Gouvernement Provincial, Rue des Augustins, 17, Brussels, from whence particulars may be obtained on payment of 4s. 6d.

Bournemouth.—June 20th. The Corporation is inviting tenders for the supply, &c., of cables, arc lamps, incandescent lamps, wiring, switchboards, fittings, &c.; also steam dynamo, &c. Particulars from the borough engineer, Mr. F. W. Lacey, also see our "Official Notices" May 27th.

Bury St. Edmunds.—June 13th. The Corporation invites tenders for the supply and erection of Lancashire boilers, three 60-kw. steam dynamos, transformer and booster, accumulators, street mains, and various other machinery and apparatus for the electricity undertaking. Consulting engineer, Mr. F. H. Medhurst, 13, Victoria Street, S.W. See our "Official Notices" May 13th.

Coventry.—June 7th. The Electric Lighting Committee invites tenders for electric mains, switchboards, arc lamps, posts and apparatus in connection therewith. For particulars of the several sections see our "Official Notices" May 13th. Mr. Gilbert S. Ram, city electrical engineer.

East London (Cape Colony).—June 28th. The Town Council is inviting tenders for erection of buildings and the supply of electric lighting machinery, electric tramcars, plant, rails, &c., and for their maintenance for six months from completion. Particulars from Messrs. Dyer & Dyer, 17, Aldermanbury, London, E.C., on payment of £5, repayable on the receipt of a *bonâ fide* tender.

Edinburgh.—June 14th. The Corporation wants tenders for the electric wiring of the police chambers (400 lamps). Particulars from the electrical engineer, Dewar Place, also see our "Official Notices."

Hammersmith.—June 8th. The Vestry is inviting tenders for the supply and erection of a Ledward evaporative condenser and tanks, air pump, circulating pumps, and pipe work. Consulting engineer, Mr. A. H. Preece. See our "Official Notices" May 27th for particulars.

London.—June 21st. The London County Council is inviting tenders for engines, dynamos, accumulators, switchboards, feeders, distributors, and service mains and all accessories, to be fixed complete in buildings at the Crossness Outfall Works, near Erith, Kent. The L.C.C. also requires tenders for providing and fixing cables, wires, conductors, casing, pendants, brackets, and other fittings, columns, lanterns, lamps, switches, and switchboards, distributing boards, fuses, cut-outs, &c., necessary for the lighting by electricity of the Crossness pumping station and works, near Erith, Kent. Particulars of both contracts from the Engineer's Department, County Hall, Spring Gardens, S.W. See also our "Official Notices" May 27th.

Sheffield.—June 13th. The Tramway Committee is inviting tenders for the erection of an electric power station for its tramway scheme. Particulars from the City Surveyor.

Southampton.—June 20th. The Corporation invites tenders for the supply and erection of lamp columns, arc and incandescent lamps, automatic switches and fittings. Consulting engineers, Messrs. Kincaid, Waller & Manville. See our "Official Notices" this week.

St. Mary, Newington.—June 6th. The Vestry Electric Light Committee is inviting tenders for the supply and erection of engines, generators, and public lighting plant for the electric lighting scheme. Engineers, Messrs. Kincaid, Waller & Manville.

St. Pancras.—June 14th. The Vestry wants tenders for condensing plant, steam pipes, &c., for the Regent's Park electricity station. Particulars from the chief clerk, Electricity Department, 57, Pratt Street. See our "Official Notices."

Taunton.—June 6th. The Corporation invites tenders for the supply and erection of engines and alternators in exchange for existing alternators and transformers, also alterations to switchboard, supply of rectifiers, &c. Messrs. Kincaid, Waller and Manville, engineers.

Tynemouth.—June 20th. The Corporation wants tenders for the supply of steam dynamos, balancer and boosters, &c. Consulting engineers, Messrs. Lacey, Clirehugh & Sillar. See our "Official Notices" this week for particulars.

Victoria.—June 24th. The Council of the city of Hawthorne (Colony of Victoria, Australia) is inviting tenders for the supply and erection of buildings, boilers, engines, dynamos, transformers, mains, meters, arc lamps, poles; also running the plant for three years. See our "Official Notices" March 11th.

Watford.—June 8th. The District Council is inviting tenders for the erection of an electric light station adjoining the new sewerage works. Particulars from the architects, Messrs. Gordon, Lowther & Gunton, Finsbury House, Bloomfield Street, E.C.

CLOSED.

Belfast.—The Corporation has accepted the tender of Mr. W. H. Drennan for wiring the new police office and cells for electric lighting.

Southampton.—The City Council has accepted the tender of Mr F. Osman for trenching and laying conduits for electric light mains, at £1,029 odd. The other tender received was from Messrs. Reid Bros., £1,280.

FORTHCOMING EVENTS.

1898.

Wednesday, Thursday, Friday, and Saturday, June 8th, 9th, 10th, and 11th.—Municipal Electrical Association Conference. See our "Notes" last week.

Friday, June 10th, at 8.30 p.m.—The Institution of Junior Engineers at the Westminster Palace Hotel. Special meeting to welcome Sir T. Salter Pyne, C.S.I., honorary member of the Institution.

At 5 p.m.—Physical Society. Agenda:—1. Exhibition of a Model illustrating Dr. Max Meyer's new theory of Audition, by Prof. S. P. Thompson, F.R.S.; 2. "Attenuation of Electric Waves along a line of negligible Leakage," by E. H. Barton, D.Sc; 3. "Diffusion Convection," by A. Griffiths, B.Sc.

Thursday, June 16th, at 9 p.m.—Institution of Electrical Engineers' Conversazione at the National History Museum, South Kensington.

NOTES.

Mr. C. E. Dolbear's Submarine Telegraph Tests.—The manifest necessity of establishing communication between vessels at sea and the shore in time of war has induced numerous inventors to try methods for accomplishing this end. Of the electrical methods tried, says the New York *Electrical Engineer*, perhaps one of the oldest, but least developed, is that of simple conduction, that is, taking advantage of the fact that a current flowing between two points not metallically connected spreads out in waves, and covers a wide area, depending upon the conducting material, the strength of the current, and distance between the terminals. To determine the relation between these quantities and the possibility of practically employing this means of communication between American vessels now stationed in southern waters, near the Florida and Cuban coasts, Mr. C. E. Dolbear, a son of Prof. A. E. Dolbear, of Tufts College, made arrangements with the New York *World* to carry on extensive experiments in the Kill von Kull, a channel of salt water between the New Jersey and Staten Island shores. 1,500 feet of No. 14 copper wire stretched along a rocky ledge between the railway station of Sailor's Snug Harbour and an old mill. The two ends of this wire were connected to copper plates immersed in the water, and a telegraph key and a number of Mesco dry batteries were placed in the circuit. After these preliminary arrangements, a party consisting of Messrs. T. A. Edison, jun., C. E. Dolbear, W. J. Clarke, Charles Cuttriss, Chas. W. Price, Max Loewenthal, O. S. Burr, W. H. Holzer, and *World* representatives, Messrs. Young and Miller, embarked on the tug *Leonard Richards* on Thursday, May 5th, to conduct the experiments across the Kill von Kull, a distance of a quarter of a mile. A wire, whose ends were connected to plates of copper inserted in the water over the bow and stern of the tug, was cut in the middle, and a telephone receiver placed in circuit. A provisional code was adopted, and signals transmitted from the shore were plainly heard by those on the tug. The experiments may be considered highly successful, and may lead to gratifying and beneficial results.

Obituary.—The death occurred on Tuesday afternoon of Sir Robert Rawlinson, the distinguished sanitary engineer. Sir Robert, who was 89 years of age, was Sanitary Engineer Commissioner of the British Army in the Crimea, and Chief Engineer Inspector of the Local Government Board.

The *Standard* also records the death of Dr. John Barrett Melson at the age of 87. He was educated at Trinity College, Cambridge, and was appointed Professor of Natural Philosophy and Hygiene at Birmingham Medical School. When lecturing at a Philosophical Institution upon physics and electro-dynamics, the late Archbishop of Canterbury and the present Bishop of Durham were among his pupils. We understand that, at the request of Sir Isambard Brunel, he calculated the lateral oscillation of engine axles, and Prof. Faraday relegated to him the question of the economical value of electricity as a motive power.

The War and the Cables.—Mr. E. W. Parsoné writes to the *Times*, from the Constitutional Club, in regard to Mr. Holland's letter on this subject, which was reprinted in our last issue. He says:—

Without doubt many interested in submarine cable property have read with interest Mr. T. E. Holland's letter published in your issue of the 24th inst., in which, after referring to the international convention for the protection of submarine telegraph cables signed at Paris in March, 1884, he says:—

"The question is a new one, but, though covered by no precedent, I cannot doubt that it is covered by certain well-established principles of international law."

This remark would lead most people to suppose that up to the present there did not exist cases of submarine cables being interfered with by belligerents. This, however, is not the case. During the Franco-Prussian war—1870-71—cables connecting places on the French coast were systematically cut in extra-territorial waters, and later, in the war between Chili and Peru, the cables of an English company connecting those two countries were cut in territorial waters, and, I believe, also in extra-territorial waters. The Chilian Government was called upon to indemnify the company for actual and indirect loss occasioned by this action, and had the claim been submitted as a whole to the international commission which sat to adjudicate claims resulting from the war, their judgment might have formed a lasting precedent for parallel cases. The Chilian Government, however, at once admitted its liability to reimburse the company for all expenses connected with the repair of the said cables, and this sum was accepted by the company in full compensation for all prejudice sustained by it. This very frank action by the Chilian Government so far as it goes should be kept in mind as forming a precedent for the liability of States which may in time of war find it expedient in their own interests to cut submarine cables or interfere with telegraphic communication by their means.

Despatches from Washington state that the cable which the scout steamer *St. Louis* cut is one of the English-owned lines between Jamaica and Puerto Rico. It is stated at Madrid that the Americans have cut the cable between Guantanamo and Hayti, which belongs to a French company.

According to the *Times* Berlin correspondent, the *Berliner Neueste Nachrichten* devotes a leading article to the question propounded in the Spanish journal *Imparcial* as to whether America has the right or not to cut submarine cables in time of war. The article says:—

There can be no doubt that Spain could inflict a very serious blow on America by the simple process of cutting the cables connecting her with Europe. Her commerce would be materially impaired. Her Stock Exchange would undergo a panic. She could not hold out three weeks were she cut off from all connection with Europe. We are astonished that Spain has not made use of this simple but effective means of warfare. Spain should remember the maxim *à la guerre, comme à la guerre*. The German law for the protection of cables has been in force since May 1st, 1888. In time of peace the cables are protected; but, on the other hand, Powers in actual state of war have a free hand to do as they please. It is another question whether compensation should be offered to those neutral Powers whose cables have been cut or in any way damaged.

Personal.—Mr. Wm. H. Marshall, who has been for two years on the technical staff of Messrs. Babcock & Wilcox, Limited, has been appointed draughtsman to the Westminster Electric Supply Corporation. Mr. Marshall was for five years assistant to Mr. Campbell Swinton.

The Electricity Committee of the Blackpool Town Council have recommended that the salary of the electrical engineer (Mr. Quin) be advanced from £300 a year to £400.

A Hitherto Unknown Cable.—We have often had occasion to draw attention to newspaper and magazine science, and the latest example of the "talented author" type may be found on page 762 of *Pearson's Weekly*. In a new serial story, "Contraband of War," a tale of the Hispano-American struggle, a party of men land to cut a cable. In five minutes someone whispered "Here it is." He pointed to *a thick rope made of many layers of netted wire, alternating with gutta-percha, which ran down a hillside, then along the sands, then dived to its dark bed within the deep.* We have inquired of every manufacturer as to the probable date of the making and laying of this remarkable type of cable, but they all disclaim any knowledge of it. Perhaps Mr. Charles Bright can enlighten us?

A Hint to English Consuls.—We reproduce the following letter from the *Scientific American*. If our consuls in foreign parts would take a leaf out of the U.S. Consul's book and send home similar reports, English electrical manufacturers would be benefited, that is, assuming that proper regard were paid thereto:—

AN ELECTRIC RAILROAD FOR FREIBURG.

To the Editor of the *Scientific American*.

The city of Freiburg, a town of 55,000 inhabitants, with most beautiful surroundings, many large villages near by, and romantic valleys into the heart of the Black Forest, is contemplating the building of an electric railroad system and a central power station for electric light and locomotive power.

Competition for these new enterprises is open to the world, and as United States consul I consider it my duty to call the attention of American manufacturers to the same, and feel that your valuable publications are the best medium for that purpose; hence send this note to you.

Freiburg is a busy little city, very conservative and slow, but sure in whatever it undertakes, and whatever is constructed here is built, not for a day or lifetime, but for an age.

"Rapid" transit they have here, but it is the old-fashioned omnibus. Electric light is seen nowhere, but in several factories with private motors and dynamos. Hence the need of these new enterprises and the call for bids for the same, such bids to be in the hands of the Committee on Underground Structures (Tief-bauamt) before July 1st, 1898.

I mail you under separate cover the circular letter, plan of the city, plans and profiles of the projected enterprises, &c., such as the above-mentioned committee sends to parties interested, and shall be glad to procure any further information for you or other Americans who may take an interest in this matter.

E. THEOPHILUS LIEFELD,
United States Consul.

Freiburg, Baden, Germany, *April 29th*, 1898.

Electric Car Accident.—It is stated that on Whit Monday one of the electric cars at the Alexandra Palace was running down an incline loaded with passengers, when the brake refused to act. The car ran down the track at great speed and collided with another, doing considerable injury. Two men who jumped from the car, also a boy, were injured.

Forthcoming Lectures.—A course of lectures on "Dynamo and Transformer Construction" will be given at the Electrical Standardising, Testing, and Training Institution, Charing Cross Road, by Mr. James Swinburne, M.I.E.E., commencing Tuesday, June 7th.

Appointment Vacant.—The Aberdeen Town Council is inviting applications for the post of electrical engineer at £225 per annum. Applications have to be lodged with the Town Clerk by June 17th. See our "Official Notices."

NEW COMPANIES REGISTERED.

New & Byrd, Limited (57,453).—Registered May 23rd, with capital £5,000 in £1 shares (3,000 6 per cent. cumulative preference), to acquire the business carried on by A. New and R. New at 24, St. Thomas Street, Liverpool, as "Archer New & Co.," and to carry on the business of electrical and general engineers, electricians, and manufacturers of and dealers in electricity, motive power, and electrical apparatus. The subscribers (with one share each) are:—R. New, The Grove, Oxton, Cheshire, gentleman; A. New, Neston, Cheshire, merchant; P. H. Byrd, 36, The Woodlands, Birkenhead, electrical engineer; H. Gaskell, jun., Clayton Lodge, Aigburth; R. Edwards, 10, Ball's Road, Birkenhead, grocer; W. Buckaman, 44, Trinity Road, Bootle, miller; A. W. Willmar, 24, Village Road, Birkenhead, cotton broker. The number of directors is not to be less than two nor more than five; the first are R. New and P. H. Byrd; qualification, 50 shares. Registered by F. Wright, Palace Chambers, Westminster.

Paterson, Bell & Co., Limited (3,879).—Registered in Edinburgh, May 20th, with capital £5,000 in £1 shares, to establish and carry on in the United Kingdom or elsewhere the business of mechanical, steam and electrical engineers, contractors, and agents. The subscribers (with one share each) are:—R. Paterson, 28, Renfield Street, Glasgow, chartered accountant; J. Spence, 28, Renfield Street, Glasgow, accountant; S. Bell, 65, Bath Street, Glasgow, engineer; J. Service, 58, Renfield Street, Glasgow, solicitor; J. B. Service, 58, Renfield Street, Glasgow, stockbroker; H. Frew, Burngreen Kilsgth, Glasgow, cashier; G. Wilson, Springfield, Helensburgh, clerk. The first directors are: R. Paterson, M. Paterson, S. Bell, and T. Carlile, 23, West Nile Street, Glasgow. Qualification, 100 shares. Registered by Oswald & Son, Edinburgh.

Dargue Acetylene Gas and Electrical Company, Limited (57,489).—Registered May 24th, with capital £5,000 in £1 shares (3,000 £5 per cent. cumulative preference), to adopt a certain agreement and to carry on the business of patentees and manufacturers of acetylene gas apparatus, electricians, mechanical engineers, and suppliers of acetylene and other gas and electricity. The subscribers (with one share each) are:—W. H. Dargue, 72, Grey Street, Newcastle, electrical engineer; F. K. Hurman, 2, St. Nicholas Buildings, Newcastle, director; C. Percy, Alnwick, solicitor; T. C. Martin, 42, Grainger Street, Newcastle, chartered accountant; W. Percy, Belvedere, Alnwick, silk mercer; A. Blake, Alnwick, solicitor; W. Armstrong, 55A, Malvern Street, Newcastle, clerk. Table "A" mainly applies. Registered by Turner & Co., 61, Carey Street, W.C.

Hydro-Incandescent Gas Light Company, Limited (57,493)—Registered May 24th, with capital £200,000 in £1 shares, to adopt an agreement with M. J. Wells & S. B. Beckles to acquire certain patent rights for Great Britain, Canada, South Africa, India and Australasia, for gas compressing and pressure regulating apparatus, and to carry on the business of suppliers of gas and electricity, gas apparatus manufacturers, electricians, electrical and gas engineers, &c. The subscribers (with one share each) are:—P. C. Beachcroft, 1 and 2, Great Winchester Street, E.C., director; M. S. Myers, 18, Finch Lane, E.C, stockbroker; S. Samuel, Stock Exchange, E.C., gentleman; S. H. Banister, 59, Wrotham Road, Camden Town, clerk; H. Howitt, 11, Victoria Street, S.W., clerk; F. J. Moore, 29, The Avenue, Ealing Dean, clerk; H. Janes, Campsbourne School, Hornsey, writer. The number of directors is not to be less than three nor more than seven; the subscribers are to appoint the first. Qualification, £250; remuneration, £200 each per annum. Registered by Faithfull & Owen, 11, Victoria Street, S.W.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

City of London Electric Lighting Company, Limited (34,406).—This company's return was filed on May 16th, when 60,000 ordinary and 40,000 preference shares were taken up out of a capital of £1,200,000 in £10 shares. £10 per share has been called on 50,000 ordinary and 40,000 preference, and £2 per share on 10,000 ordinary, resulting in the receipt of £920,000.

Corlett Electrical Engineering Company, Limited (36,200).—This company's annual return was filed on May 16th, when 620 shares were taken up out of a capital of £6,200 in £10 shares; 100 have been issued as paid, and £5,200 has been received on the others.

City of Mexico Electric Power Syndicate, Limited (55,438).—This company's statutory return was filed on May 12th, when 40 shares were taken up out of a capital of £5,000 in £50 shares; £25 per share has been called, and £880 paid, leaving £120 in arrears.

CITY NOTES.

The Brazilian Submarine Telegraph Company, Limited.

The report of the directors for the half-year ended December 31st, 1897, to be submitted to the forty-ninth ordinary general meeting, June 8th, 1898, states that the revenue for this period amounted to £100 300 4s. 3d., and the working expenses to £26,166 8s. 3d. After providing £3,200 for debenture interest and sinking fund, and £1,353 2s. 8d. for income-tax, there remains a balance of £69,580 13s. 4d.; to this is added the sum of £7,221 5s. 5d. brought forward from June 30th last, making a total of £76,801 18s. 9d. In commemoration of Her Majesty's Jubilee, and of the 25th anniversary of the foundation of the company, a bonus has been granted to the staff, amounting to £4,139 14s. 7d. First and second interim dividends, amounting to £39,000, have been paid, and £25,000 transferred to the reserve fund, leaving the sum of £8,662 4s. 2d. to be carried to the next account. The directors with great regret report the death of their esteemed colleague, Lord Sackville A. Cecil. The vacancy has been filled by the appointment of Sir John Wolfe Barry, K.C.B. Negotiations for closer working with the Western and Brazilian Telegraph Company, Limited, have been in progress, and an agreement will shortly be submitted to the shareholders.

South Staffordshire Tramways Company.

Mr. Somers L. Schuster (chairman) presided over the eighth ordinary general annual meeting of the above company held yesterday (Thursday) at the Cannon Street Hotel, and in moving the adoption of the report, said it was the first time he had been able to recommend a dividend of any sort, and he trusted they would now go from bad to better. The dividend to be proposed was 2⅝ per cent. on the preference shares. The working expenses amounted to £18,247 12s. 7d. as against £17,934 in the previous year. The general expenses were £1,917 against £3,521, the decrease being due to the absence of litigation. Repairs had cost £8,000, as against £6,895. He could hold out no hope of the expenses under that head decreasing, because the permanent way must be kept up. The total receipts were £32,916 4s. 5d., as against £31,830, but he could hold out little hope of this being much further increased. He thought, with their present method of traction, they had pretty well reached their maximum. The improvement which would take place if they had a much quicker and more regular, and he might say a better method of traction, would undoubtedly tend to increase the receipts very largely. If they had a 10 minutes' service as against a half-hourly service, it would make a great deal of difference; but that was a question for the future. There was a difference of opinion on the board. Mr. Dawson held the opinion that the one thing which would help the South Staffordshire Tramways was the system of auto-traction. That had been tried for two years under the supervision of Mr. Dawson, and the report of the manager showed that it was a ghastly failure. At a recent conference held at Birmingham, all represented, with one exception, were in favour of electric traction, whether overhead or underground.

Mr. Blundstone seconded the motion.

Mr. Roff asked if anything had been done with reference to handing over the company to the British Electric Traction Company, Limited.

The Chairman: The whole thing has been completed.

Mr. Roff said he protested against the way in which the vote was taken at the last meeting.

The Chairman said had it not been for the agreement the company would have been wound up. It was neck or nothing, and they had got neck and something.

Mr. Fuller said the money might have been raised somewhere else, and it was Mr. Dawson who was the true friend of the company.

The Chairman said he went to five of the largest financial houses to get the money required, and not one would touch it.

The report was adopted.

Great Horseless Carriage Company (in liquidation).—The liquidator of the above company is prepared to receive offers for certain shares in the Motor Manufacturing Company, Limited, and shares and debentures in the British Motor Company, Limited, not taken up by the shareholders of the Great Horseless Carriage Company.

Shannon Electric Power Syndicate.—We understand that Mr. J. F'G. Bannatyne, D. L., has resigned his seat on the directorate of the Shannon Electric Power Syndicate.

The Spiral Globe, Limited.—Letters of allotment for shares in this company were posted last week.

TRAFFIC RECEIPTS.

The Bristol Tramways and Carriage Company, Limited.—The receipts for the week ending May 27th, 1898, were £2,653 5s. 4d.; corresponding period, 1897, £2,473 2s. 6d.; increase, £180 2s. 10d.

The City and South London Railway Company.—The receipts for the week ending May 29th, 1898, were £1,012; week ending May 30th, 1897, £929; increase, £83; total receipts for half-year, 1898, £22,678; corresponding period, 1897, £22,390; increase, £288.

The Dover Corporation Electric Tramways.—The receipts for the week ending May 28th, 1898, were £147 1s. 2d.; total receipts to May 28th, 1898, £2,357 0s. 3d.

The Dublin Southern District (Electric) Tramways Company.—The receipts for week ending Friday, May 27th, 1898, were £577 2s. 1d.; corresponding week last year, £681 15s. 10d.; decrease, £104 13s. 9d.; passengers carried, 89,005; corresponding week last year, 98,010; aggregate to date, £9,498 3s. 2d; aggregate to date last year, £10,049 11s. 7d.; decrease to date, £551 8s. 5d.; mileage open, 8 miles.

The Liverpool Overhead Railway Company.—The receipts for the week ending May 29th, 1898, amounted to £1,412; corresponding week last year, £1,310; increase, £102.

The Western and Brazilian Telegraph Company, Limited.—The receipts for the week ending May 27th, 1898, after deducting 17 per cent. of the gross receipts payable to the London Platino-Brazilian Telegraph Company Limited, were £3,077.

AUSTRALIAN NEWS.

[FROM OUR OWN CORRESPONDENT.]

ELECTRICAL work in New South Wales appears at present to be confined to Government works, the trams being monopolised by the Railway Commissioners, and the only electric lighting contracts settled lately being for the lighting of various Government offices. The George Street electric tramway is beginning to show signs of progress, as work has been commenced on the permanent way at the Harris Street end of the line, and walls are springing up on the spot selected for the power house and car house, which, by the irony of fate, are on the site of the old omnibus stables. In connection with this line further contracts have been awarded to Messrs. Phippard Bros. for erecting the chimney stack for the power house, at a cost of £2,365, and to Messrs. Stewart & Co. for the erection of car house at £12,490. In the case of the former, two sets of tenders were called. On the first specification the prices varied from £5,285 to £6,864, nine tenders being received, on the amended specification ten tenders were sent in varying from £2,365 to £3,750. The car house will be 273 feet by 130 feet, built on hardwood piles, with planking, wailing, &c., with concrete foundation. There will be a suite of offices comprising employers', dining, lavatory, and store rooms; the side walls are brick, with iron principals roofed with nine spans of saw-tooth form. The roof principals, of which there are over 100 of 30 feet span, are rolled iron, supported on rolled iron columns. Front facing roadway is supported on cast-iron columns closed in with revolving shutters; back end wall consists of timber. On floor of car house is an examining pit, 114 feet by 60 feet and 4 feet deep, cars carried over same by strong iron back railbearers, 10 × 8; also a repairing pit constructed of concrete, 173 feet by 14 feet. The chimney shaft is to be of circular form, 235 feet above ground line, with concrete footing and brick base. Mr. C. Keeling's tender of £775 for the trolley wire for this line has also been accepted.

The Rose Bay tramway is also progressing favourably, the generators have been housed at last, the underground feeders laid, and a considerable portion of the permanent way laid and bonded, and the rails of the cable train, of which this line will be an extension, are also bonded with Edison-Brown plastic bonds. Feeders have also been laid, together with those for the tramway, for an electric pumping station for the Double Bay sewerage, and it is probable that the new generators will first be utilised for this purpose, as the pumping plant bids fair to be completed well before the tramway.

The Public Works Department have recently gone in very extensively for electric lighting, amongst those completed being the Hawkesbury Agricultural College, Kenmore Asylum for the Insane, Berrima and Darlinghurst Gaols, and the Government printing office. For the lighting of the Goulburn Gaol 14 tenders were received, ranging from £2,387 to £2,669, Messrs. F. Lasseter & Co.'s tender of £2,450 being accepted for Ransomes, Sims & Jefferies engine and Siemens dynamo. For the Bathurst Gaol nine tenders, varying from £1,986 to £2,616 were received. Specifications are in hand for the electric lighting of other public buildings.

In the matter of the electric lighting of the city of Goulburn, though tenders were only received from two firms, the Council have accepted the tender of Mr. R. Thompson at £7,665, to include a Lancashire boiler, Worthington pump, and three 35-H.P. engines, the system to be three-wire at 440-volts, and mains to be placed underground in the principal thoroughfares. The tender also provides for running the plant for two years at £600 per annum, charging $4\frac{1}{2}$d. per unit for private consumption.

At Tamworth the Municipal Council, after a lengthy discussion, unanimously adopted the report of the Lighting Committee recommending a comprehensive scheme for the utilisation of the surplus water-power at the service reservoir for generating electricity for both the public and private lighting of the town. It is proposed to erect a duplicate set of Pelton wheels and dynamos capable of supplying from 1,200 to 1,400 16-C.P. lamps; using overhead mains, the cost is estimated at about £4,300. Steps will now be taken to secure the passage through Parliament of a Bill empowering the Council to contract with the people for a supply of electric light, also for power to make charges and collect the same. (Needless to say, that, notwithstanding repeated ministerial promises, the N.S.W. General Electric Lighting Act is still hung up indefinitely). The Council confidently anticipate being able to reduce the Tamworth lighting rate from 5d. to 3d. if this scheme is carried out, and give private consumers current at a rate equal to about half the present cost of gas.

At Broken Hill reports on the lighting of the town have been submitted by gas and electrical experts. The prime cost of electric lighting is estimated at £12,500, with an annual maintenance charge of £2,657 10s., while the gasworks, &c., is estimated to cost £8,750 to put down and annual cost of working £1,936 10s. Under these circumstances, and as there is already an electric supply company in Broken Hill, it is hardly probable that the Municipal Council will put down an electric light plant.

The New South Wales Department of Industry recently asked the Crown solicitor to give his opinion as whether, legally considered, electricity can be defined as "goods." The Department wished to know if a place engaged in the generation of electricity was a factory within the meaning of the Factories and Shops Act of 1896. The Crown solicitor has given the opinion that, for the purposes of this Act, the generation of electricity is the manufacture of goods.

In Victoria, the recently passed Electric Lighting Act has generally stirred up the Melbourne electric supply companies. The A. U. Alcock Electric Lighting and Power Company appeared before the Postmaster-General recently to prosecute their application for an extension of the area within which they may operate. They were opposed by the municipalities of Melbourne and Hawthorne, the other corporations interested consenting to the application. It was represented that the A. U. Alcock and Australian Electric Lighting Companies were to be amalgamated, and that the joint business was to be conducted with the aid of a large amount of British capital. The money would be forthcoming as soon as the order sought was obtained, and the united company would be in a position to cater for every possible electric want in Melbourne. A compromise between the City Council and the companies was suggested, but proved fruitless. Since then the Melbourne City Council have made a further move. The Lighting Committee have recommended that the Corporation should exercise its statutory power in buying out the electric lighting companies, and undertake the whole task of supplying the metropolis with electric light. This announcement was made by the Mayor of Melbourne to the Postmaster-General in connection with a further application from the companies. Some months ago the Corporation began to supply private customers with light at a lower rate than that charged by the companies, and it is therefore claimed that the interests of the citizens will be much better served when the business of electric lighting is wholly in the hands of the Corporation. A special meeting of the Council will be called to consider the committee's report. If it be adopted—and of that the Mayor thinks there is no doubt—the necessary steps will be at once taken to determine the sum to be paid to the companies. The Electric Light and Power Act provides that each company shall receive the value of its works, materials, land, and buildings, with 10 per cent. added. The book values of the assets of the two companies amount to nearly £150,000.

In marked contrast to this, the Sydney Municipal Council are not making the slightest attempt to avail themselves of the powers granted to them by Act of Parliament so long ago. In the meantime, a number of small central supply stations are starting up, and supply mains are to be seen stretching in all directions over the house-tops; and by the time the Sydney Council do make up their minds, these will have to be dealt with as the Melbourne Corporation are now doing.

In Brisbane the Municipal Council have given notice of their intention to apply for an order-in-council under the new Act, to supply electricity within the city. Within two years from the date of the order, it is intended to construct electric lines and works in 29 streets. The Brisbane Railway Commissioners are endeavouring to arrange with the tramway company for the lighting of the long railway tunnels with electricity. The company's manager has placed the matter before the directorate to complete arrangements. The tramway company has some 24 miles of track now working.

Sydney, *April 14th*, 1898.

INSTITUTION OF CIVIL ENGINEERS' CONVERSAZIONE.

On Thursday and Friday evenings of last week the Institution of Civil Engineers' conversazione was held at Great George Street. The Civil's conversazione always possesses considerable interest for electrical men, but the 1898 gathering may be safely said to eclipse all others in this respect, the president for the year being Mr. W. H. Preece, C.B., F.R.S., whose position as engineer-in-chief to the General Post Office, and whose popularity among electrical men will, we hope, make the session, to a large extent, an electrical one. We take this opportunity of again congratulating Mr. Preece upon being appointed first electrical president of this time-honoured Institution.

On Thursday night the president, Miss Preece, and the Council, received the guests. As already intimated in our columns, there was brought together by Mr. Killingworth Hedges, in honour of Mr. Preece's election, an exhibition of electrical apparatus of historical interest.

The programme was a very elaborate one, and we quote a few of the items. The string band of the Royal Engineers played in the Hall during the evening; there were exhibitions of views by the biograph; an exhibition by Captain Abney of Dr. Joly's process of photography in natural colours; a demonstration by Mr. Campbell Swinton on some phenomena of the electric discharge in vacuo; a demonstration of wireless telegraphy by Mr. J. Gavey; and various engineering models and scientific apparatus were on exhibition. Mr. Wallis-Jones, of the Electric Welding Company, showed the latest type of automatic electric welder, and samples of recent advances in electric welding; Hon. C. A. Parsons had on view a unipolar dynamo made in 1887, and an 1884 turbo-generator. The Edison & Swan Company's exhibit comprised some of the earliest Ediswan lamps and holders, including the original Swan lamp lent by Mr. Swan. Mr. Crompton showed a Crompton-Pochin projector arc lamp, a 1,000-ampere automatic zero cut-out, a 500-ampere heavy pattern switch, and electric thermometers at work. Mr. James White had a number of Kelvin instruments; Mr. Cowper-Coles had parabolic reflectors; Dick, Kerr & Co., sections of rails and sleepers; Mr. L. B. Atkinson, early types of Swan & Lane-Fox lamps. Mr. Alexander Siemens exhibited an electric drill, a deck driller, a Hughes telegraph transmitter, a Cardew transmitter, a submarine detector and exploders. Mr. Killingworth Hedges, in addition to his collection of apparatus, showed specimens of copper rapidly deposited by electrical currents of high densities. Mr. W. E. Gray (Silvertown) had some cables and electric light apparatus on view, and Messrs. Barnard & Carver showed arc lamps applicable to photo-micrography and other projection apparatus. Messrs. A. Wright & Co. exhibited a 60-inch Letheby-Bunsen standard photometer made by them for the Hinckley Urban Council. Mr. Preece lent a Gaulard and Gibbs transformer. Mr. Lundberg showed a number of his specialities. Edmundson's Electricity Corporation showed some original types of electrical fittings. Mr. Hedges lent a Gramme dynamo made by Mr. W. Blanch Brain about 1878, the original Lane-Fox meter, and system of cut-outs, fuses, and switches invented by Lord Kelvin about 1881. Mr. A. G. Lyster showed some early Serrin lamps.

From the above notes may be gained a general idea of the very varied and interesting character of the exhibition which formed an important feature in the conversazione arrangements.

SOME NOTES ON AN ELECTROLYTIC METHOD FOR THE RECOVERY OF GOLD FROM CYANIDE SOLUTIONS.*

By SHERARD COWPER-COLES, A.M.I.C.E., M.I.E.E.

One of the chief difficulties appertaining to the economical recovery of gold from weak cyanide solutions by electrolysis has been the electrodes. If several sheets are cut superimposed, the strips cling together, and have to be carefully spread out one by one, so that the surface may be exposed to the solution. A clean up is made every seven or eight weeks, when the wood frames carrying the lead strips are withdrawn, the lead strips removed, and new substituted, the auriferous lead being ultimately melted down and conveyed to a central works to be cupelled. This method is both crude and expensive, the labour of fitting the strips into the frames is considerable, and the consumption of lead is a considerable item, having been computed by Mr. Von Gernet, at the Worcester mine, at 1·10 of a penny per ton of ore treated, and Mr. Williams, at the Crown Reef Gold Mining Company, at 1·75.

The cathode should fulfil the following conditions:—

1. The gold must be adherent during the process of deposition.
2. The gold must be capable of being readily stripped after remova from the electrolysing cell.
3. The cathode should be electro-positive to the gold in solution, so that it is coated with gold on immersion.

These conditions are fulfilled, I find, by substituting an aluminium cathode for a lead one, advantage being taken of the fact that a loose film of oxide is very rapidly formed on aluminium, the difficulty in soldering and electro-plating aluminium for this reason being well known. The substitution of aluminium for lead foil, or strip, enables the gold to be obtained as pure gold, and daily returns to be made of the amount of gold recovered; it also has the additional advantage of reducing the cost of labour and economising the amount of cyanide of potassium used, as the solution is not contaminated by any base metal such as zinc. The deposition of gold from a cyanide bath on to an aluminium plate proceeds in a uniform manner, but in such a way that the gold is deposited as a metallic sheet which is easily detachable from the aluminium cathode. This peculiar property of aluminium is made use of in the invention so that the gold deposit can be removed by stripping or peeling or rubbing almost as soon as it is formed, and if as proposed, the aluminium cathode consists of a sheet of the metal fixed to a revolving drum or cylinder, by varying the rate of rotation the film of gold can be brushed or removed from off the cathode continuously, so that the process is an automatic one, resulting in the immediate and continuous recovery of the gold without any subsequent cupellation of the lead as in the older electrolytic process.

The process has therefore in it the elements of economic working, coupled with the quick recovery of the valuable gold. In the Siemens-Halske process, the lead cathodes remain some weeks in the bath, and the gold, which only then amounts to about one-tenth the weight of the cathode, is only recoverable therefrom after a second further operation of smelting and cupellation. In the Siemens-Halske process lead was chosen as the cathode, as it has the property of allowing the gold to adhere to it. In the aluminium process aluminium is used as the cathode, as it permits of the easy removal of the gold film. In the former process the gold has to be won from the lead by a secondary operation; in the latter the gold is directly obtained in the form of a pure foil, without any further expense or trouble. Gold, by this process, has been successfully extracted from cyanide solutions containing only ·01 per cent. of cyanide of potassium, and

* Read before the Institution of Mining and Metallurgy, April 20th, 1898.

2½ dwts. of gold to the ton of solution. The best results are obtained when the solution is raised to a temperature of about 100° F.; it is also found advantageous to use a greater current density with the necessary increased voltage when the aluminium plates have been freshly placed in the solution, so as to ensure their being covered with a film of gold as quickly as possible, otherwise there is a tendency for aluminium hydrate to be formed. In about 10 hours an extraction of 95 per cent. can be obtained by the use of the aluminium cathodes, the amount of gold in solution before electrolysis being 2½ dwts. to the ton of solution, and the strength of cyanide ·01 per cent. and the rate of flow about 15 gallons per 100 hours for every cubic foot of electrolysing cell or three square feet of cathode surface. Gold has been deposited on aluminium cathodes from solutions containing only ·0075 per cent. of cyanide of potassium; the current density per square foot being ·03, and E.M.F. at the poles of the generator 6 volts.

The following are the results obtained from gold cyanide solutions of varying strengths, with aluminium cathodes and iron anodes.

First Experiment.

A cyanide solution containing 3·2 grammes = 2 dwts. gold per gallon and 22·71 grammes per gallon of potassium cyanide or 0·5 per cent. solution was electrolysed. The aluminium cathode had an area of half a square foot, and two similar sized iron plates formed the anodes, placed 1½ inches from each side; the amperage being 1·50 and the voltage 1·40 at the terminals of the electrolysing cell. The gold began at once to deposit on the aluminium cathode as a bright coherent coating, and the deposition was allowed to continue for 15 minutes, when the amperage was found to be 2·0 and the voltage 3·40. The layer of gold could be completely and easily detached by rubbing gently with a piece of india-rubber tubing fixed on a glass rod.

A fresh cathode was then inserted.

Time of immersion ...	1.05 ...	Amps., 3·10 ...	Volts, 4·40
Taken out	1.20 ...	„ 3·20 ...	„ 4·60

The gold was removed from this cathode, and a fresh one inserted, without changing the conditions.

Taken out	1.50 ...	Amps., 2·60 ..	Volts, 4·70

As gold still continued to be deposited the experiment was continued.

Time of immersion ...	2.20 ...	Amps., 2·80 ...	Volts, 4·70
Taken out	2.55 ...	„ 2·60 ...	„ 4·80
Time of immersion ...	3.0 ...	„ 2·30 ...	„ 4·60
Taken out	4.0 ...	„ 2·20 ...	„ 4·90
Time of immersion ...	4.15 ...	„ 2·60 ...	„ 4·90
Taken out	5.15 ...	„ 2·00 ...	„ 4·90

The whole quantity of gold recovered in these six experiments was well washed to remove traces of potassium cyanide, and then weighed—

Gold added ...	3·200	grammes ...	100 per cent.
Gold found ...	2·7108	„ ...	84·70 „

It will thus be seen that 84·70 per cent. of the total gold was recovered from the solution in 3 hours 35 minutes, using an average amperage of 2·51 per plate, or a current density of 5·02 amperes, and an average voltage of 4·63.

Second Experiment.

In this experiment a weaker solution of potassium cyanide containing 11·35 grammes per gallon = 0·25 per cent. solution was employed. The percentage of gold was nearly doubled, viz, 91 grains = 5 = 94 grammes = 3·80 dwts. per gallon.

The experiment was divided into two portions, the yield of gold at each stage being determined.

First stage:—

Time of immersion,	11.15 ...	Amps., 3·00 ...	Volts, 4·75
Taken out	1.05 ...	„ 2·00 ...	„ 5·10

Second stage:—

Time of immersion,	1.20 ...	Amps., 2·10 ...	Volts, 4·90
Taken out	3.40 ...	„ 2·00 ...	„ 4·80

The experiment had to be discontinued at this stage owing to a short-circuit taking place within the cell.

The gold recovered—

First stage, in 1 hour 50 min., 3·005 grammes = 50·59 per cent.
Second stage, in 1 hour 20 min., 0·875 grammes = 14·73 per cent.

A total quantity of gold amounting to 65·32 per cent. was, therefore, recovered in 4 hours and 10 minutes, although it will be noted that the greater part of the gold was deposited in the first two hours.

Third Experiment.

A solution containing 6 dwts. of gold per gallon and 32·71 grammes of potassium cyanide, being a 0·5 per cent. solution, was employed.

The gold was deposited in three stages and weighed separately, as follows:—

First stage—

Time	5.30 ...	Amps., 6·25 ...	Volts, 4·30
Taken out ...	6.00 ...	„ 5·20 ...	„ 4·10

Gold deposited, 2·930 grammes = 32·02 per cent.

Second stage:—

Time	6.12 ...	Amps., 4·80 ...	Volts, 4·10
Taken out ...	6.45 ...	„ 4·20 ...	„ 4·30

Gold deposited, 1·340 grammes = 14·68 per cent.

Third stage:—

Time	6.55 ...	Amps., 2·20 ...	Volts, 2.30
Taken out ...	8.45 ...	„ 2·10 ...	„ 2·30

Gold deposited, 2·055 grammes = 22·46 per cent.

69·13 per cent. of gold was thus recovered in 3 hours 33 minutes, and the greater part was also deposited in the first half hour, viz., 32·02 per cent.

These experiments demonstrate that the process affords a quick method for depositing gold from its cyanide solutions, and also show that it is easy to remove the film of metallic gold from the aluminium cathode by mechanical means.

In another experiment some gold tailings were carefully assayed, and found to yield a button of gold, equivalent to 1·4 grammes gold per 1,000 kilos., or approximately 1 dwt. per ton.

The quantity of tailings used for testing the efficiency of the process was 90 lbs. This quantity was placed in a suitable vat, and treated by the well-known methods for extracting the gold by means of a cyanide solution. The tailings were first leached with a weak caustic soda solution, containing 4 ounces caustic per ton of water, and after its removal, a cyanide solution containing 0·5 per cent. K C N was added. This solution was allowed to leach the tailing for several hours, and was then drawn off into an electrolytic vat. The tailings were then leached dry for some hours in order to ensure the complete solution of the gold, and the double cyanide so formed was leached out with a weak cyanide solution containing 0·18 per cent. K C N. After this solution had been drawn off into the electrolytic tank the last traces of the gold solution was washed into the vat with water. The time occupied for the whole operation was 50 hours, so that it represented the same time as is used in actual practice on a commercial scale. The total amount of liquors obtained in this way and submitted to electrolysis amounted to about 50 litres, or about 11 gallons, or about half the weight of the tailings treated.

From the above assay the theoretical quantity of gold which should be extracted from the above weight of tailings is 0·056 gramme, or $\frac{1}{30}$th of a dwt. On submitting the solution to electrolysis, a current of 0·29—0·31 ampere was employed, at a pressure of between 6 and 7 volts. As the area of the aluminium cathode was approximately 1 square foot, the current density corresponds to the amperes. The electrolysis was allowed to proceed for seven hours, and at the end of that time the gold was seen covering the whole of the cathode as a very bright golden deposit of extreme thinness. Notwithstanding the thinness of the film, it was found possible to detach it mechanically.

THE DIESEL OIL ENGINE.

As considerable attention has of late been directed to the Diesel motor, it may be of interest to compare its operation with other internal combustion engines from which the Diesel motor differs in one rather important principle.

In the standard, or Otto type of engine, worked either by gas or by oil, there are four strokes of the piston in the full power cycle, two out-strokes and two in-strokes in the following sequence: No. 1, an out-stroke drawing in a charge of gas and air. No. 2, an in-stroke compressing this charge, which is ignited by *external means* just at the point of maximum compression. No. 3 is the out-stroke during which the ignited gases do work on the piston, and No. 4 is the in-stroke of exhaust when the products of combustion are expelled. If a good diagram be examined from an ordinary gas engine, it will be observed that the compression line is joined to the expansion line by a vertical line of explosion. This shows that the gas mixture, compressed in the clearance space of the cylinder is burned instantaneously, or to use the physicists' terms, the combustion takes place at constant volume. The volume of the clearance space controls the pressure of compression. Apart from the heating of the charge by compression and from the cylinder walls, the pressure will simply vary with the ratio of the total cylinder volume to the clearance space. Thus if the clearance is 20 per cent. of the total volume, the compression will run up to five atmospheres. Obviously, as explosion takes place at constant volume, it must be accompanied by an increase of temperature.

By compressing a gas its temperature is raised, the work of compression becoming converted into heat. Conversely if a gas be compressed it will ignite more readily than when not compressed. By very high compression it would be found that the charge in a gas engine would explode spontaneously, and ignition might be thus secured without external means. In the oil engine of the Hornsby-Akroyd type ignition would always be premature if it were not that the vaporiser were shut off from the cylinder by the long bottle neck through which the air necessary to explosion has to travel to mix with the oil vapour in the hot vapouriser. In the Diesel motor there are two differences from the foregoing mode of working. In the first place the compression is very great, rising to over 500 lbs. per square inch. At this high compression the combined effect of compression and of the cylinder heat is to raise the temperature of the compressed charge to a very high point, so high, indeed, that if a combustible were present it would ignite. The compressed charge consists of air only, and at the point of maximum compression, fuel is introduced by means of a small pump, and as the piston moves on its outward working stroke the combustion of the injected fuel maintains the temperature so that the expansion line is much fuller than the compression line, the difference being work. By regulating the fuel admission the combustion does not cause, as in the ordinary engine, a sudden and large increase of temperature, but merely as above stated keeps up such temperature as was attained by compression, the endeavour being to secure isothermal expansion. There is, in fact, no sudden explosion in the Diesel engine. The fuel ignites as it enters a vessel of highly compressed air and burns just as an ordinary gas jet burns when it enters the atmosphere from a common burner with a light to give its initial ignition. The large ratio of air present, its high pressure bringing every particle of fuel into close contact with plenty of air, produces a perfect combustion. Obviously with such high pressures the expansion ratio can be great, and it is said that the clearance space is not over 7 per cent. Hence in the larger sizes compound working is resorted to. The compound Diesel motor is made so far with two high pressure cylinders and one low pressure cylinder, the latter having a working stroke every revolution and taking its charge from the high pressure cylinders alternately, these being arranged to alternate their working strokes for this purpose. One end of the low pressure cylinder is used as the first stage air compressor. Air is partially compressed into a reservoir, whence it flows to each of the small cylinders, and is in them compressed to about 500 lbs. The Diesel motor differs from the ordinary gas engine in not having an explosive mixture to compress. It works simply by the heat effect of a flame burning in compressed air.

So far the fuel used in this new motor seems to be oil, but powdered coal has been suggested as a practical fuel, though it seems to us that the dust therefrom would be prejudicial in vertical engines except where the shaft is above the cylinders, so that dust cannot reach the pistons so readily, an arrangement much against the possibility of introducing the coal by gravity. Originally, too, the water jacket was not to have been employed, but has been found necessary.

It is claimed that a fuel efficiency is secured of 28 per cent. as against 18 per cent. for ordinary gas engines. Even half of this saving would mean a very big saving. The doubts that will advance themselves will be in reference to the satisfactory working of an internal combustion engine with such very high pressures. Given this item, and there is no reason why the Diesel motor should not succeed and be economical. But except that it compresses air only and injects its fuel when ignition is required there is not so very much really new about it. It has long been known that increased compression meant an increased economy in the gas engine. Increased compression could not, however, be arranged, or there would be premature explosion, and high compression is thus only possible with the new method of supplying fuel. The Diesel motor is in fact a device for securing high compression, as pointed out by theory, should be secured. The fact that the compressed charge is all air, causes the combustion of the fuel jet to be very perfect, and there is no smoke or smell from this motor.

Generally speaking, the theory seems to be all right. Can the practice be made so? This is, of course, a question for constructive mechanics. The pressure to be employed is one which must tell seriously upon pistons, though against this is to be set the absence of explosive action. The maximum pressure is brought gradually on the parts during the compressive stroke, and the pressure line of the diagram is merely kept above the line of compression by the heat action of the burning jet. Originally the inventor talked of a compression running into hundreds of atmospheres and there was to be no water-jacketting.

The engine experimented with in Germany about 1894 had a compression of 90 atmospheres. As now being made, we believe about 35 atmospheres is the maximum compression; there is a water jacket, and the efficiency, instead of the hoped for 60 to 70 per cent., is less than 30 per cent. The inventor has set himself a difficult task. We should like to see him succeed in a very praiseworthy attempt to secure motor working nearer to thermo-dynamically correct lines. As he himself said, if the very high pressures he proposed could be employed, motors would become mere models compared with our existing steam engines. In Herr Diesel's book, "The Rational Heat Motor," published about four years ago, very high expectations were held as to the possibility of high pressures and the abolition of the water jacket and efficiencies of 70 per cent. were anticipated. Could the water jacket be abolished in the ordinary gas engine, it is a question whether over 60 per cent. efficiency could not be obtained at ordinary pressures. The practical question now is, is it likely to pay to use even the low pressure of 500 lbs. for the sake of getting 28 per cent. efficiency, and is the Diesel motor offering promise of anything more than this after its few years' trial and experience?

THE ECONOMICAL USE OF EXHAUST STEAM.

Writing in the *Electrical World*, Mr. Perkins considers the question of using exhaust steam. He instances a water-power where the driven factory uses so much steam for drying purposes that the firemen cannot tell when the relay engines—used when the water is low—are running or standing, because all the engine exhaust is available for heating purposes. He very properly questions the economy of the water-power in this instance. Another instance is cited where a college is electrically lighted, and is heated also from the exhaust steam, and, owing to certain minor improvements introduced when the light was installed, the fuel bill is less than it was before there was any light. The light really costs nothing, for the heat was previously required.

It would appear, however, that in paper mills the reverse may be the case, and Dr. Louis Bell has protested against the use of exhaust steam for drying purposes, while a case is given by a Mr. Schillit where an engine 13 inches × 21 inches × 175 revolutions per minute drove the mill and heated 13 driers and used 2,868 lbs. of steam per hour with a back pressure of 23 lbs. When exhausting freely, and using live steam for drying, the consumption, all told, was only 2,745 lbs. In each case there were 14 other driers heated, in both cases by live steam. The question seems to resolve itself into one of the increased steam consumption of the engine with 23 lbs. back pressure. To approximate to this, he prepares a diagram showing the percentage of extra steam in an engine 14 inches × 36 inches × 85 revolutions per minute, producing 100 H.P., and he shows that it will not pay to incur 6 lbs. of back pressure for the sake of using the exhaust unless the amount of exhaust used exceeds 20 per cent. of the steam used by the engine under normal conditions. If only 3 lbs. back pressure is needed, then 10 per cent. of the normal steam must be used. These conditions assume that the remainder of the exhaust is blown away at the increased pressure. It appears that the 13 driers did not require so much steam as the engine used normally. Yet a back pressure of 23 lbs. implied that the engine must double its consumption, and obviously the consumption would be greater than if there were a free exhaust and live steam in the driers, and that if the other 14 driers had been available for exhaust heating there would have been economy. The lesson to learn is not that the use of exhaust is not an economy, but that it should be freed from conditions of back pressure, unless the whole of it is needed. Clearly it is poor practice to close up the exhaust of a big engine in order to force steam through long pipes to boil one glue kettle.

ON THE PRODUCTION OF A "DARK CROSS" IN THE FIELD OF ELECTRO-MAGNETIC RADIATION.*

By JAGADIS CHUNDER BOSE, M.A., D.Sc., Professor of Physical Science, Presidency College, Calcutta.

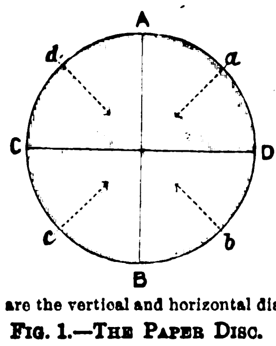
A circular piece of chilled glass when interposed between crossed nicols produces a dark cross. A similar effect is produced by crystals like salicine where there is a radial disposition of the principal planes.

I have been able to detect a similar phenomenon in the field of electric radiation by the interposition of an artificial structure between the crossed polariser and analyser.

I have in a previous communication described the polarisation produced by the leaves of a book. For the following experiment, a long strip of paper was rolled into a disc. A roll of Morse tape serves the purpose very well. The diameter of the disc is 14 cm. and its thickness 2 cm. It will be observed that here we have a single axis passing through the centre, and that all planes passing through the centre are principal planes.

The effect produced by the interposition of the structure may be studied by keeping the disc fixed and exploring the different parts of the field by means of the detector; or the detector may be kept fixed (opposite the analyser) and the disc may be moved about so that the different parts of the field may successively be brought to act on the detector. This latter plan was adopted as being simpler in practice.

The arrangement of the apparatus is the same as in fig. 1 of my



A B, C D, are the vertical and horizontal diameters.

Fig. 1.—The Paper Disc.

paper "On the Rotation of Plane of Polarisation of Electric Waves by a Twisted Structure." The polariser is vertical and the analyser horizontal. The paper disc is interposed between the screens with its plane at right angles to the direction of the ray.

The receiver is fixed on the prolongation of the line (which I shall call *the axis*), joining the centres of the polariser and the analyser.

On the supposition that the interposition of the disc produces a dark cross, the arms of the cross (with the particular arrangement of the polariser and the analyser) will lie in the projections of the vertical and the horizontal diameters of the disc, and will move in space with the movements of the disc. When the centre of the disc is on the axis, the intersection of the cross will be superposed on the receiver, and there should then be no action. If the disc be moved up and down, the centre remaining in the vertical line passing through the axis, the vertical arm of the cross will slide over the

* Communicated to the Royal Society by Lord Rayleigh, F.R.S. Received February 14th, read March 10th, 1898.

receiver. If the disc be moved laterally, with its centre in the horizontal line passing through the axis, the horizontal arm of the cross will slide over the receiver. In this, as in the last case, there should be no action on the receiver. But if the disc be displaced so that the centre does not lie in either the horizontal or the vertical line passing through the axis (the axis now cutting the disc at points such as *a*, *b*, *c*, or *d*), the arms of the cross will not fall on the receiver, and there should be a response in the receiver.

The experiments were now arranged as follows:—The disc was at first placed with its centre on the axis, the plane of the disc being perpendicular to the axis. There was now no action on the receiver; but as soon as the disc was tilted, however slightly, an action was immediately produced on the receiver.

The disc was now mounted on a stand, between the two screens. By means of sliding arrangements the disc could be raised or lowered, or moved laterally.

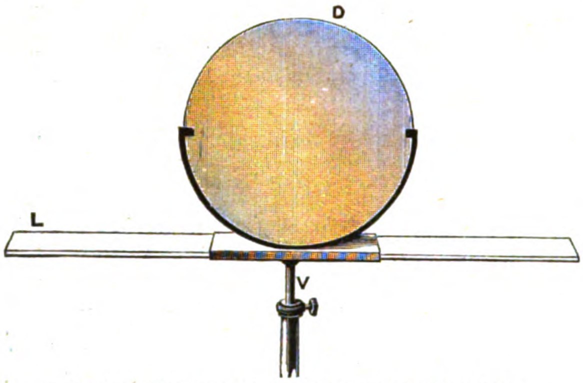
In the next experiment the centre of the disc was first adjusted on the axis, and the disc moved vertically up and down. No effect was produced when this was being done.

The centre of the axis was again adjusted on the axis, and the disc moved laterally on the horizontal slide. In this case, too, there was no action.

By adjusting the vertical sliding rod the centre of the disc was next placed vertically above or below the axis. The disc was then moved laterally either to the right or to the left. In this way the field could be displaced, and the quadrants, *a*, *b*, *c* or *d* (see fig. 1), placed opposite to the receiver. In all these cases, even with small displacements, very strong action was produced on the receiver.

From experiments carried out in the manner described above, the outline of a dark cross projected in space was distinctly made out.

A disc of wood, with *concentric rings*, would probably show the effect equally well. I shall, in a future paper, send an account of the



D, the paper disc; V, L, are the vertical and horizontal slides.

Fig. 2.—The Holder for the Disc.

action of crystals cut perpendicular to the axis placed in convergent or divergent beams of electric radiation.

Some of the investigations on the rotation of the plane of polarisation will, perhaps, be facilitated by an observation of the rotation of the cross. By a modification of this method I am at present trying to detect the rotation produced in a magnetic field.

Addendum, March 16th, 1898.

The production of a dark cross can also be demonstrated by interposing between the crossed polariser and analyser concentric rings of tinfoil mounted on a thin sheet of mica. But greater interest is attached to the exhibition of the phenomenon by double refracting substances, where the axes of elasticity are disposed in radial directions. From the peculiar stresses present, I surmised that woody stems with concentric rings would exhibit the phenomenon above described. Through the kindness of Dr. Prain, I obtained from the Government Botanical Gardens, Sibpore, stems of *Pinus longifolia*, *Swietenia mahogani*, *Araucaria Cunninghamii*, *Mangifera indica*, *Casuarina equisetifolia*, *Cupressus torulosa* and *Dalbergia sissoo*. The ring systems present in some of these were very regular. I was, however, at first disappointed in failing to obtain the results anticipated. But this failure, I subsequently found, was due to the general opacity of the wood, which was freshly cut, and which, though apparently dry, contained large quantities of sap in the interior. I then carefully dried some of the specimens, when the stresses present became quite apparent by numerous cracks starting in radial directions. The results obtained with these dried specimens were quite satisfactory.

I now tried to devise some experiments strictly analogous to the optical experiments with chilled glass. For this purpose I cast a cylinder of paraffin wax in a metallic mould surrounded by a freezing mixture. Owing to the great contraction produced by solidification, a hollow depression was formed in the centre, and this produced a distortion of symmetry. It would, therefore, be better to build up a cylinder by successive dippings, the deposited molten layer contracting on the solid core. I obtained, however, extremely good results with a cylinder of cast ebonite, in which the stresses present are exactly similar to those in a circular piece of unannealed glass.

The next series of experiments were undertaken with mineral specimens. I here acknowledge with thanks the kind help I received from Mr. Hayden, B.A., and Mr. Blyth, of the Geological Department, in obtaining suitable specimens for my experiments. One very interesting specimen obtained from Egypt was formed by ringed concretion of flint round a central nodule. This specimen exhibited the cross with great distinctness. I also obtained fairly satisfactory results with stalactite. The concretion of calcium carbonate formed inside a pipe by deposits from temporarily hard water flowing through it, would also be found to exhibit this phenomenon.

NEW INDUCTION COIL.

Abstract of a paper read before the Röntgen Society by Alfred Apps, *M.I.E.E., and Member of the Röntgen Society, on May 10th, 1898, entitled "Notes on the Description of a 'New' Induction Coil, 'Electrical Review,' February 4th, 1898, page 165."*

The author considers many of the points advanced to be erroneous, and he insists that the members of the Röntgen Society require the most accurate information with a view to the improvement of their X ray appliances. Dealing with the statement that the Ruhmkorff coil is the only one in use, he adduces facts showing that it was, for all practical purposes, superseded some 28 years ago. Ladd greatly improved it, and the author devised a new form both as to coil and accessories which became, with further details, the subjects of a series of patents. These instruments are now known as Apps coils. On the subject of efficiency, it is pointed out that the Ruhmkorff coil, an excellent instrument 30 years ago, weighing about 20 lbs., and giving 1½ inches spark of about the same dimensions as the Apps coil of the present day, giving 8 inches spark. This coil has about 6½ miles of wire as secondary as against the 8½ miles which, by calculation, appears to be coiled on the central bobbin of the "new" coil described in the Electrical Review. The weight there stated, 600 grammes, appearing to be a misprint. It is contended that experience is the best answer as to decay or burning of insulation in the secondary coil, and particulars are given of many coils of the Apps manufacture under the patents referred to, where no decay could be found after nearly 30 years' use, nor diminution of spark length. Cases of extreme damp, immersion in sea water, &c., acid fumes, and direct sunlight impinging on the ebonite exterior are excluded. High power and portability, as in the 8 to 10-inch Apps coils are urged as important for X ray work. The dimensions of secondary bobbins are discussed, and by means of a diagram it was shown that the sectional area of the secondary bobbin of a nominal 4-inch Apps coil working to 7 inches, was practically the same as that of the "new" coil. In answer to the assertion that all coils are defectively insulated, experience is again advanced. The author, however, admits the extreme desirability of high insulation, but points out that other qualities have to be sought, such as portability, strength, freedom from chemical action leading to explosion and ignition. As an example of high efficiency, where a spark of 4½ inches was reached (as long as the bobbin), the coil made by Apps for the late Mr. W. Spottiswoode, F.R.S., is mentioned (see *Phil. Mag.*, Jan., 1877, p. 30). Fluid insulators are discussed at some length; and replying to the proposals in the Electrical Review, the author declines to grant that, all things taken into account, any advantage can be gained by the use of fluid insulators for the secondary of an induction coil. In supporting this view, he refers to the very limited use of oil for the insulation of transformers where the voltage is exceedingly low in comparison with that employed in the induction coil. To show the danger of an accumulation of carbon formed from the oil, he instances the case of a condenser, 20,000 volts only, where there was found to be an accumulation of carbon in the glass cell. In this case resin oil was used. It is further pointed out that authorities differ widely as to the insulating power of oils—that the nature of the electrical discharges affect the percentage or efficiency of oil insulators to an extreme degree, and, further, that the precise nature of the electrical excitation in the secondary of a coil is not satisfactorily known, and that, therefore, the value of oil insulation is uncertain. As there is carbon formed in all oil insulators—certainly when the electrical stress is great. It is produced in the interstices of the secondary winding, thereby destroying all insulation and cannot fall away by gravitation. In 1870 the author, in conjunction with Mr. H. C. Baines, of Pembroke College, Oxford, tested the use of oil in induction coils, and discarded it for similar reasons.

The danger of accumulations of gas in oil insulated coils is discussed at considerable length. The visible bubbles rising to the surface while the coil is working and the possibility of enlarged bubbles being formed in the interior parts and then fired by a minute spark, lead the author to conclude that considerable danger of an explosion is incurred. He has seen such explosions, and refers to Tesla's description of a coil tried when unfinished in a darkened room presenting the appearance of a "mass of fire." The author some 20 years ago was endeavouring to ascertain how small a spark would explode gas. He employed a common medical magneto machine, with a small condenser attached to the rotating contact breaker. Sparks scarcely visible of about $\frac{1}{20}$th inch long thus produced were found sufficient to fire a mixture of coal gas and air

Much has been written as to the proper shape of the secondary coil, and as a contribution to the history of this matter, and to show that the bobbin recommended in the Electrical Review is not the best, reference is made to the experiments of Mr. Ladd about the year 1860. He thoroughly tested the use of various forms, and found no advantage from a large central bobbin. It is contended that the lines of force, within which the secondary wire must be placed, are found in such positions and relative intensities (Kapp lines per square centimetre) that one is led, both by theory and experience, to wind the wire nearly to the whole length of the primary coil, and in depth equal to about one-eighth of the length. The wire recommended, 0·16 cm., is considered too small for a coil designed for 20 cm., or about 8-inch spark.

The author thinks that no good can be gained by undue economy as to secondary wire, and he refers to the use of iron wire now largely employed in very cheap coils which soon rusts asunder, and he humorously says that there are also other devices for constructing coils so as to make them last for a short time. With special reference to X ray work, it is pointed out that unless the secondary coil be of considerable length, the sparks will not be so frequent as to give good results. It is an outpouring of energy that is required, and not a simple disruptive discharge. The great coil made for Mr. Spottiswoode gave a continuous outflow at each discharge for at least half a second when the terminals were separated from 1 to 2 inches, and it is precisely this effect, though necessarily less in degree, that is wanted for the best X ray work.* As an instance of long spark lengths from a small quantity of wire a 3-inch Apps coil is referred to, which, as a maximum, gave 6½ inches. In conclusion, it is stated that induction coils can now be constructed according to specified conditions—it is simply a matter of ordinary electrical engineering practice found to follow very closely the data the author has accumulated during an experience of 33 years. Finally, he expresses his thanks to the authors of the paper in the Electrical Review.

Note on Mr. Apps's Paper on "A New Induction Coil."

Mr. Apps's long experience in the manufacture of induction coils with a deservedly high reputation entitles his opinions to the greatest respect. In some respects, however, we think his criticism of the coil invented by MM. Rochefort-Lucay and Wydts (Electrical Review, 42, p. 165) is unfair. He objects to the statement at the commencement of that article that the Ruhmkorff coil is the only one in general use, but Mr. Apps must know that the term Ruhmkorff coil is in general use for the modern induction coil, and does not mean the coil exactly as it was constructed more than 40 years ago by Ruhmkorff. The first Ruhmkorff coil imported into this country by Groves in 1852 had 10,000 turns in the secondary coil, and gave only a ¼-inch spark in air. But since that time many important improvements have been made in its construction, by which Mr. Apps, as well as other makers, have been enabled to leave far behind the original inventor of the induction coil; for instance, Sinsteden applied the condenser in 1855, Ritchie invented winding the secondary in compartments in 1857, and many improvements were made in the contact breaker by other inventors. Liquid insulators even, were tried with success by Jean in 1858. Mr. Apps makes excellent coils, and no doubt has discovered many important improvements in details in the course of his practice. We quite agree with him that the central coil shown in the illustration of MM. Rochefort-Lucay and Wydts's coil is not the best disposition of the secondary wire. But as we understand it that is not an essential part of their invention, Mr. Apps's remarks on liquid insulators appear also to be beside the question. The French inventors' improvement consisted in the use of *viscous or pasty* insulators, which in many respects have different properties from liquid insulators—for instance, they can stand a longer static strain without allowing the electricity to leak away by convection. The excellent results obtained with the viscous insulators, even though they might not have appeared quite so good if an Apps coil had been used for comparison, indicate that it may be worth while to make further experiments in this direction. Mr. Apps alludes to a series of patents in which his improvements in induction coils have been embodied; we can find only two, one in 1867, and one in 1896. The first patent relates principally to his well-known and excellent contact breaker, and the second principally to matters of detail in the insulation of the primary and secondary coils. In these patents there appear to be no epoch-making steps in the evolution of the induction coil, or at least nothing to justify Mr. Apps in drawing such a hard and fast line between the Apps coil and the Ruhmkorff coil. We readily acknowledge that Mr. Apps makes excellent coils, but all the same, we do not think he has yet reached the *ne plus ultra*. The present low efficiency of the induction coil as a transformer of electric energy leaves plenty of room for improvement.—Eds. Elec. Rev.

BELT DRIVING.

I.

Every species of power transmitting device has its advocates. These advocates often push the virtues of their pet ideas in and out of season and irrespective of surroundings. We can hardly say this of Mr. Tullis who, in his paper on "Belt Driving," read before the West of Scotland Technical College Scientific Society, certainly said all he could for belts, but did not seriously overstate matters. He certainly gave some very useful points to his hearers. For really high class belting the centre of a belt ought to be the centre of the hide, the spine of the ox lying evenly between the two halves of the strip. Such belts should be cemented and stretched, and properly made, will run perfectly true and straight. A safe tension is 50 lbs. per inch of breadth of $\frac{3}{16}$ single leather, and 80 lbs. for double leather. On this item of cementing, the present writer was recently asked to supply a length of the best 4-inch belt to be obtained. He sent the "all cemented joints" of a leading maker, and the engineer rejected the belt as not the best. It is thus clear that belt users are in need of instruction. It is often most difficult when supplying the very best goods in the market to obtain credence for the fact. In regard to the care of belts there should be no dust allowed to cake on a belt, and a belt face should be clammy and should be kept from undue dryness by a reliable dressing. We can understand this, but what is a reliable dressing? A pulley ought not to become bright, this implies slip. A non-slipping belt makes a pulley face dark coloured.

A belt only slips if out of condition or overloaded. Slip implies friction and loss of power and destroys a belt. If overloaded a belt can be compounded. Mr. Tullis is great on compounding. A compound belt is simply one belt running freely on the top of another. An 8-inch belt run on a 12-inch belt is equivalent to a 20-inch belt, the 8-inch belt will do as much work as if on a pulley of its own. When running at over 4,000 feet per minute belts ought to be thin, pliable, and tough, as orange tan or raw hide softened. If compounded they may be run up to 9,000 feet velocity, but we do not see how the author makes out that compounding "deadens and counteracts centrifugal force," and for a 9,000 feet velocity to be economical we consider a belt must have a more than usual working-tenacity per unit weight as 7,000 is usually considered quite an outside velocity taking centrifugal stresses into account.

The flesh side should run next the pulley; it is the stronger, but if overloaded the grain or hair side should be next the pulley, as it will better stand the overheating due to slip. Belt thickness must not exceed a given ratio to the pulley diameter. A 4-inch pulley must not carry a belt above ⅛-inch thick. Up to 8 inches a belt may be $\frac{5}{32}$-inch thick, thin $\frac{3}{16}$-inch up to 12 inches, and $\frac{1}{4}$-inch b are up to 18 inches diameter. Above 18 inches heavy leather can be used. We publish Mr. Tullis's table of belt powers and speeds in full.

Pulley and Belt-Power Table,

showing what horse-power 1 inch in width of single or double leather belt will transmit when running on pulleys from 1 foot diameter to 10 feet diameter:—

1	"	"	"	108	"	222		"	"			"
1	"	"	"	120	"	200		"	"			"

The above figures contemplate durability. A belt will do 30 per cent. more than the table without slip, if kept a little tighter and in good condition. Even twice the power can be transmitted at high tension, but a belt ought to do its duty when slack. Its "slack" side ought to be distinctly slack. Mr. Tullis would save pulley cost by using compound belts. Two 20-inch belts will do more than one 40-inch belt on a wide pulley. Superposed belts check surging and air cushioning. The top belt really is working on a leather pulley, and the under belt is being held against its pulley firmly.

Mr. Tullis advances instances of the benefit from compounding insufficiently strong belts. In our own practice we well remember where certain 4-inch belts were continually giving trouble. We changed them for 5-inch belts and the trouble ceased. All Mr. Tullis's examples are to the effect that by means of placing one belt over another, the work done may be increased in fully the ratio of leather used, and such compound belts are altogether satisfactory, and may even be used as shifting belts with strap forks, &c.

In quarter twist drives the ordinary flat belt, especially in a short drive, has one edge of the belt badly strained. This fault is got over by making special belts with one side longer than the other. So made they work perfectly, and may also be compounded. They ought to be of thin leather.

For really heavy work link belting is advised. It ought to have a flexible centre as it will then fit the crowning of the pulleys and do 30 per cent. more than if flat; but here again Mr. Tullis is wrong in saying that on such a belt centrifugal force has no effect. Such belts should not be tightened until they slip, unless the slack side sags down to touch the tight side.

The breaking strain of a link belt ⅞-inch thick is given as 1,400 lbs. per inch of breadth for oak tanned and 1,800 lbs. for orange tanned.

On tapered cones a link belt made to fit the cones will work without trying to climb against the shifter. Some such belts are made for steep pitched cones, which have a cross section varying from ⅝ to 2¼ in a width of 6 inches. Such belts are, of course run half-twisted. If an open drive must be used then a full twist must be put on to both sides of the belt so as to get the correct arrangement of the taper of the belt upon the cones.

A little belt slip may sometimes be desirable, as, for example, when driving a dynamo from a gas engine when a little slip prevents surging and waves in the belt.

(To be continued.)

THE INSTITUTION OF ELECTRICAL ENGINEERS.

The Design of Electric Railway Motors for Rapid Acceleration. By Prof. Charles A. Carus-Wilson, Member. Read May 26th, 1898.

The torque on the shaft of a motor may be expressed by the equation,

$$t = 1{\cdot}41\, p\, \text{A}\, \text{C}\, \text{N}\, 10^{-8} \text{ inch-pounds} \quad (1)$$

where N is the number of C.G.S. lines per pole, A is the number of surface conductors, C is the total current passing into the motor, in amperes, and p is a numerical constant depending upon the way in which the armature is wound. This equation may be written,

$$t = 1{\cdot}41\, \text{C}\, \text{M} \quad (2)$$

where M is given by

$$\text{M} = p\, \text{A}\, \text{N}\, 10^{-8} \quad (3)$$

We shall call M the *induction factor* of the motor. Since the tension, e, induced at n revolutions per second is given by

$$e = \text{A}\, \text{N}\, n\, 10^{-8} \text{ volts} \quad (4)$$

the induction factor may be found by dividing the induced tension in volts by the speed in revolutions per second, and the induced tension is given by the product of the induction factor and the speed.

The constant, p, may be defined as the ratio of the number of surface conductors in series between the main terminals to the number of surface conductors lying between two adjacent neutral points, and is unity for a bipolar machine, whether drum-wound or ring-wound.

When a motor is running at n revolutions per second, and taking a current of C amperes, we have the following expression for the speed:—

$$n = \frac{\text{E} - \text{C}\,\text{R}}{\text{M}} \quad (5)$$

where E is the terminal tension in volts, and R is the resistance of the motor in ohms measured between the same points as the tension. Hence, in the case of a railway motor, the speed in feet per second is given by

$$s = 0{\cdot}262\, \frac{d}{\text{M}\, v}\, (\text{E} - \text{C}\,\text{R}) \quad (6)$$

where v is the ratio of the speed of the motor to that of the main axle—afterwards called the velocity ratio—and d is the diameter of the driving wheel in inches.

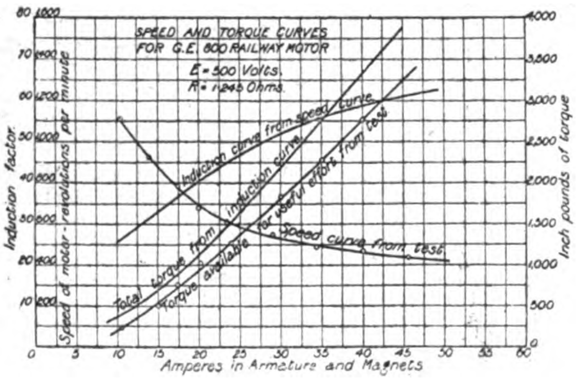

Fig. 1.

If an experiment be made in which the speed, the tension of the line, and the current are observed, we can find from equation 5 the value of the induction factor for different currents, and thus obtain what we shall call the *induction curve*. Such a curve is given in fig. 1, for the "G.E. 800" railway motor made by the General Electric Company.

From the induction curve we can deduce the curve of total torque for different currents. This curve will lie above that obtained by measuring the torque at the rim of the brake-wheel, the difference for any current representing the torque expended in overcoming friction of gearing, hysteresis, &c. The ratio of the two ordinates for any current gives the mechanical efficiency for that current.

If the current passing through the motor at any instant is greater than that required to overcome the frictional and other resistance to motion, the motor will accelerate, and the acceleration in feet per second will be given by

$$a = 405 \times 10^{-4}\, \frac{\text{M}\, v}{d}\, \frac{\text{C}_a}{\text{W}} \quad (7)$$

where C_a is the current in amperes available for acceleration, and W is the whole weight that has to be accelerated, in tons of 2,240 lbs.

As an illustration, we may take the motors used on the Baltimore and Ohio Railroad. The conditions are as follows:—A train weighing 780 tons has to start from rest on a grade of 0·8 per cent. The train is drawn by a locomotive equipped with four motors permanently connected in series. The driving wheels, which are gearless, have a diameter of 62 inches. The maximum current from the line is limited to 1,800 amperes, and the mean value of M while the motors are starting may be taken as 155.

The tractive effort per motor required for the grade is 3,490 lbs., and for friction, allowing 9 lbs. per ton, 1,755 lbs., making altogether 5,245 lbs. If we allow 95 per cent. mechanical efficiency, we find from equation 2 that the current required to overcome friction must

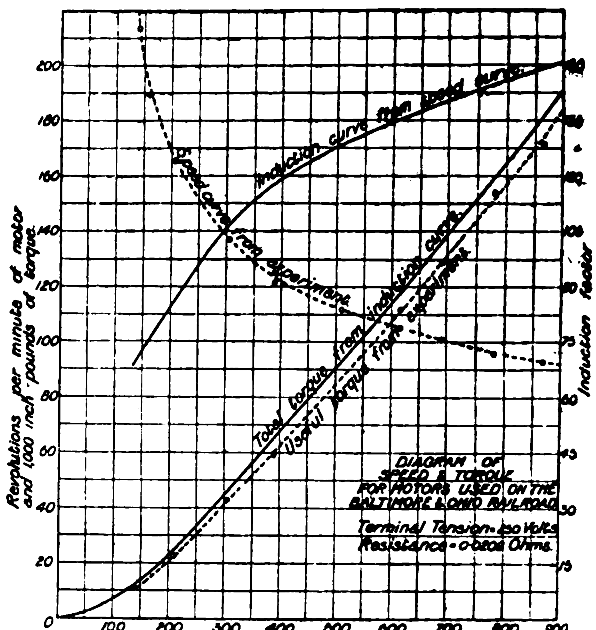

Fig. 2.

be equal to 780 amperes, leaving 1,020 amperes available for acceleration. Under these circumstances the train will start up from rest with an acceleration of 0·53 f.p.s. per second. The induction curve of these motors is given in fig. 2, and the current-curve observed in starting is given in fig. 3.

If a pulley of d centimetres diameter is placed on the shaft of a motor of induction factor M, carrying a current of C amperes, the tangential force at the rim of the pulley is given by

$$\text{T} = \frac{1}{\pi\, d}\, \text{M}\, \text{C}\, 10^{7} \text{ dynes} \quad (8)$$

If $d = \frac{1}{\pi}\, 10^{7}$ centimetres, this may be written,

$$\text{T} = \text{M}\, \text{C} \text{ dynes} \quad (9)$$

The force of a motor may thus be defined as a force of M C dynes at the rim of a pulley 10^{7} centimetres in circumference. We shall call M C the *force factor* of the motor. Thus, in the preceding

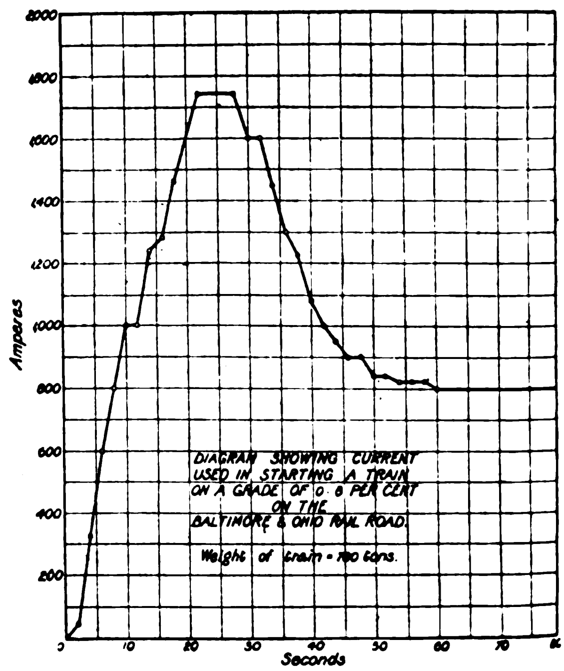

Fig. 3.

example, each of the four motors must have a force factor of 279 kilodynes in order to start up with an acceleration of 0·53 f.p.s. per second.

The rating of a motor in horse-power gives us no indication of its ability to accelerate, though this may be the most important function it is called upon to perform. Thus, in the last example, the horse-power of the motors at the moment of starting is nothing. In the problem that we now propose to discuss we shall find it convenient to be able to define the action of a motor in terms of a force unit instead of a power unit, and for this purpose we shall make use of the force factor. We may note in passing that the power in kilowatts at any moment is given by multiplying the force factor in kilodynes by the number of revolutions per second.

When a given distance has to be covered, we may divide the whole period of motion into two parts—that of acceleration and that of uniform speed. For the present we shall assume that, if there are two or more motors in the locomotive, they are connected in parallel, and that they speed up with uniform acceleration until full speed is reached.

From equations 6 and 7 it appears that, if everything else remains unchanged, the acceleration increases directly, and the final speed inversely, as $\frac{M\,v}{d}$. For example, if we keep M and v the same, we can increase the acceleration by putting on a smaller wheel, but we shall thereby reduce the final speed. The accelerating period will then be small, and most of the distance will be covered at full speed.

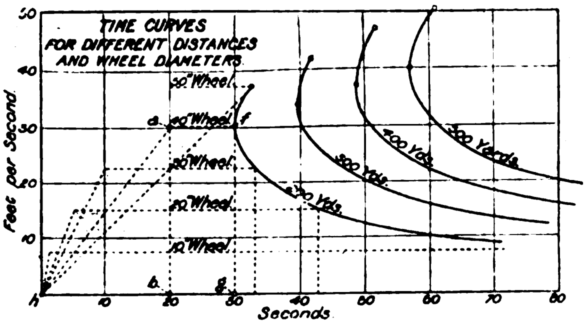

FIG. 4.

On the other hand, if we increase the diameter of the driving wheel, we shall get a small acceleration but a high final speed; most of the distance will then be covered during the process of accelerating, and full speed may not be reached before the given distance has been traversed. Similarly, if we vary the velocity ratio, keeping M and d the same, we shall get the reverse of these results. Or, if we keep v and d fixed and vary M, we shall get the same results as if we varied the velocity ratio.

In fig. 4 the horizontal axis represents seconds, and the vertical axis speed in feet per second. Let us suppose that the conditions are such that with a driving wheel 40 inches in diameter an acceleration of 1·5 f.p.s. per second is obtained, and that the final speed is 30 feet per second. A distance of 200 yards will then be covered in 30 seconds, 20 seconds being occupied in accelerating, during which time 100 yards is covered, the remaining 100 yards being covered in 10 seconds at full speed.

If now we replace the 40-inch wheel by one whose diameter is 30 inches, we increase the acceleration to 2 f.p.s. per second, but reduce the final speed to 22·5 f.p.s., so that it takes 33 seconds to travel 200 yards. If we put on a 50-inch wheel, the acceleration is decreased to 1·2 f.p.s. per second, and full speed is only just reached when the 200 yards has been covered, the time being nearly 33 seconds.

If a line, such as $a\,f$ in the figure, is drawn to a point at which the given distance is covered, the points thus found by using wheels of different diameters will lie on a curve. We shall call this the *time curve*. In the figure, dotted lines such as $h\,a$ represent the accelerating period, and dotted lines such as $a\,f$ the period during which the motors are running at full speed. The area $h\,a\,f\,g$, then, represents the whole distance covered in the time $h\,g$.

Time curves have been drawn for distances of 200, 300, 400, and 500 yards. An increase in the value of M or of v gives the same result as a decrease in the value of d.

It is evident that there is a certain value of $\frac{M\,v}{d}$ for which the time occupied in covering any given distance is a minimum. This value we shall now proceed to find.

We know from equation 7 that the acceleration varies inversely as $\frac{d}{M\,v}$. We may express this fact as follows:—

$$\frac{a\,b}{h\,b} = k_1 \frac{1}{\beta} \qquad (10)$$

where k_1 is a constant, and $\beta = \frac{d}{M\,v}$.

From equation 6 we have

$$a\,b = k_2\,\beta \qquad (11)$$

where k_2 is a constant.

If D is the whole distance in feet that has to be covered, we have

$$D = \tfrac{1}{2}\frac{k_2^{\,2}}{k_1}\beta^3 + k_2\,\beta \times b\,g \qquad (12)$$

hence, by substitution, we get

$$t = \frac{D}{k_2\,\beta} + \tfrac{1}{2}\frac{k_2}{k_1}\beta^2 \qquad (13)$$

where t is the time occupied. To find what value of β makes the time a minimum, differentiate and equate to nothing, and we have

$$\beta^3 = \frac{k_1}{k_2^{\,2}}\,D, \text{ or } b\,g = \tfrac{1}{2}\,b\,h$$

The given distance then is covered in the shortest time, when the equipment is such that the distance travelled during the process of acceleration is equal to that travelled at full speed, the time of accelerating being two-thirds of the whole time.

Substituting for k_1 and k_2 their values as given by equations 7 and 6, we get

$$\left\{\frac{d}{M\,v}\right\}^3 = 0.59\,\frac{D}{W}\,\frac{C_a}{(E - c_f\,R)^2} \qquad (14)$$

It appears, then, that, when a train of weight W tons has to be started from rest and moved through a distance of D feet, the tension of the line being E volts, the accelerating current c_a amperes, and the internal drop when running at full speed $c_f\,R$ volts, the time occupied is least when the ratio $\frac{d}{M\,v}$ is that given by equation 14; and that, if this value of $\frac{d}{M\,v}$ is adopted, half the distance will be covered in the process of accelerating.

Since the equation 14 gives the value of $\frac{d}{M\,v}$ for covering any distance in the least time for a given accelerating current, it follows that, when the time as well as the distance is given, the accelerating current will be least when half the distance is covered during acceleration.

For, if any other ratio of $\frac{d}{M\,v}$ is adopted than that which covers half the distance during acceleration, the time will be prolonged, and consequently a greater accelerating current required.

We have, then, two conditions to fulfil. First, half the distance must be covered at full speed in one-third the time. If we are at liberty, as we generally are, to adjust the value of the resistance so that the drop at full speed is independent of M, v, and d, we then have

$$\frac{M\,v}{d} = 0{\cdot}1747\,\frac{t\,e}{D} \qquad (15)$$

where e is the induced tension at full speed, or the tension of the line minus the heat drop.

It thus appears that the ratio $\frac{M\,v}{d}$, which governs the design of the whole equipment, is given by the consideration that half the distance must be covered at full speed in one-third of the time.

The accelerating current can now be found from equation 7. We know that half the distance has to be covered in two-thirds of the time: this gives us the acceleration. We know also the value of $\frac{M\,v}{d}$, and of W: hence we deduce,

$$C_a = 55.5\,\frac{D\,W}{t^2}\,\frac{d}{M\,v}, \qquad (16)$$

or we may write at once,

$$C_a = 318\,\frac{D^2\,W}{e\,t^3}. \qquad (17)$$

If we know the retarding forces at full speed we can find the current, since $\frac{M\,v}{d}$ is fixed, and hence we can obtain the resistance of the motor.

For example, suppose that we have to design an equipment by which a tramcar weighing 10 tons can be started from rest and moved through 500 feet in 30 seconds. We may suppose, further, that two motors are to be used, connected in parallel throughout; that the tension of the line is 500 volts, and the drop at full speed 9 volts.

From equation 15 we obtain the value of $\frac{M\,v}{d}$, and find it to be 5·15. We may assume for the present that v is limited to 4·78, and that d is 33 inches; hence M = 35·5. The maximum speed is 25 feet per second, or 17 miles per hour. If the frictional and other forces retarding the motion are equal to a torque of 3,580 inch-pounds on each axle, the current at full speed will be 15 amperes, and the resistance of each motor 0·6 ohm.

(*To be continued.*)

PHYSICAL SOCIETY.

MAY 27TH MEETING.

MR. CAMPBELL SWINTON read a paper on "Some Further Experiments on the Circulation of the Residual Gaseous Matter in Crookes Tubes." In the discussion that followed the former paper on this subject, at the Physical Society on March 25th, 1898, Mr. Appleyard had suggested that, in tracing the cause of the rotation of the exploring mill, it would lead to simpler results if the vanes were made of some light conducting substance, for it was probable that mica introduced complications by retaining the charges. Prof. Boys then pointed out that the mica might be gilded. Such a tube has now been made by Mr. Wolff. With the gilded mica vanes so placed as to be outside the cathode stream the mill behaves in a manner similar to the non-conducting insulated mill. It shows a greater tendency to assume a position of stability, due to electrostatic induction, this renders it somewhat troublesome in starting, but, when once under way, the mill rotates always when excited. Occasionally, when starting, a few reverse revolutions are observed, these are probably due to electrostatic influence and momentum, and also possibly to eddy currents in the residual gaseous matter. But it is found, in all cases, that rotation in the direction that indicates a stream of residual gaseous matter from anode to cathode, follows the reversal immediately after one or two oscillations. An electrometer connected to the mill, through the pivot and needle-point, shows the vanes to be always electrified positively. The results are confirmed by a second tube with oblique vanes. The author concludes that at very high exhaustions there exists a molecular or atomic stream from anode to cathode, which carries a positive charge and travels at high velocity outside the opposite cathode stream.

Mr. J. Quick asked what was the minimum degree of exhaustion required to produce these results.

Prof. Boys said that the experiments gave some amount of probability to the truth of Mr. Campbell Swinton's hypothesis, but it did not altogether prove the mechanical theory of rotation to be correct. He was glad that the chance suggestion at the last discussion had led to such interesting experiments being continued.

Prof. Threlfall mentioned that Boettger had devised a method for gilding mica, by a chemical process, that was much to be preferred to ordinary gilding.

Mr. Campbell Swinton said it was necessary to exhaust the tubes as completely as possible, to a point where it was only just possible for any discharge at all to pass through them. If the rotation was due to electrification, there must still be some mechanical process whereby the charges get to the vanes—a stream of residual gas satisfied that condition.

The Vice-President proposed votes of thanks and the meeting adjourned until June 10th.

TRANSATLANTIC CABLES.

Messrs. Siemens Bros. have kindly permitted us to publish the following tabular statement of calculated and actual speeds compiled by them of Atlantic cables. It will be noticed that in the 1894 cables, which are of different lengths, and varying weights of copper and insulation, the advantage would be with the manufacture of Messrs. Siemens, length and weight of core being equal (see cols. 9 and 10).

As the earlier figures may require further notes to explain that the speeds given were by mirror or recorder, or by simplex and duplex, we have preferred to draw attention only to the two results directly comparable, viz., the 1894 cables:—

1	2	3	4	5	6	7	8	9	10	11
Date when laid.	Designation of cable.	Length in nautical miles.	Type of core of deep sea cable. Lbs. per naut. mile	K R. Ohm × Microfarads / 10_6	Calculated speeds taking 1874 cable at 20·2 words per minute.	Calculated speeds taking 1874 cable at 27·6 words per minute.	Speeds actually obtained in regular working.	Calculated speed if lengths 1,850 naut. miles.	Calculated speed if lengths 1,850 naut. miles and core 650/400.	Manufactured by

1894	Anglo-American ...	1,850	650/400	2 420	29·31	40·04	47·4 (*e*)	47·4	47·4	Tel. Const. & Mtnc. Co.

(*a*) Report of engineers, Messrs. Clark, Forde & Co., to the manager of the Anglo-American Telegraph Company, dated June 25th, 1877.
(*b*) Report of engineers, Messrs. Clark, Forde & Co., to the manager of the Direct United States Cable Company, dated June 25th, 1877.
(*c*) Report of the engineer-in-chief, Mr. von Chauvin, to the Pouyer-Quertier Cable Company, dated June 15th, 1880.
(*d*) Report of Dr. Muirhead to Mr. von Chauvin, representative in London of the Western Union Telegraph Company, dated July 10th, 1883. (i.) Special trial of code words, 18 words per minute; (ii.) Press messages, usual rate, 25 " " " — mean 21·5; (iii.) As many as 135 letters per minute have been observed to pass at times without requiring repetition.
(*e*) *Electrician*, dated October 12th, 1894.
(*f*) Speed specified as basis for column 7 is taken from a letter from the manager of the Anglo-American Telegraph Company, dated September 20th, 1894.
(*g*) From a letter from Mr. G. G. Ward, vice-president and general manager of the Commercial Cable Company, dated May 10th, 1895.

It will be noticed in column 8 that the actual working speed obtained with the cables made and laid by Siemens Bros. & Co., is very much greater than that calculated upon, even allowing for all the progress in manipulation and manufacture. Columns 9 and 10 prove this even more clearly, the figures given there having been calculated (from actual speeds) according to well-established formulæ—column 9 showing what the speed would be if all the cables were only 1,850 nautical miles long, and column 10 if the length and weight of core of all the cables were the same as those of the 1894 Anglo Cable.

THE "FULMEN" ACCUMULATOR.

We know that accumulators intended for electro-mobiles should above all possess a high *specific power* (watts per kilogramme of *total* weight) and a high *specific energy* (watt-hours per kilogramme of *total* weight) in order to reduce as far as possible the dead weight carried, and so to increase the length of the journey that the battery enables us to make without recharging. These figures are now pretty well established for certain types of accumulators, and we find under the signature of one of the best authorities on *automobile locomotion*, M. Ed. Hospitalier, a very competent article on the "Fulmen" accumulator, which is already well known to our readers. This article describes the progress realised in apparatus for the storage of electrical energy during the past 15 years.

The type that we have examined, says M. Ed. Hospitalier, is distinguished by the symbol B_{13} and comprises 13 plates: 6 positive and 7 negative. The plates, which are rectangular, are 18½ centimetres high, 9½ wide and 4 millimetres thick. They form a block consisting of 24 rectangular cells, in which is lodged the active material. Thin sheets of celluloid prevent the plates from coming in contact with one another.

The moist plates cut level with the fastening gave us the following respective weights of the grid and of the active material (in grammes).

	Positive plate.	Negative plate.
Grid	135	135
Active material ...	340	255
Total weight	475	390

The surface of each plate is 1·75 square decimetres of the total surface for the 12 faces of the six position plates.

The celluloid trough and the partitions separating the plates weigh 600 grammes. The total weight of the complete element with the liquid is 7·5 kilogrammes.

M. Brault, administrator and delegate of the Fulmen Accumulator Company, considers the normal *régime* of discharge equivalent to a current of 21 amperes corresponding to a continuous discharge of 5 hours, or a density of current of 1 ampere per square decimetre of surface of the positive plates, but the accumulator can, at the expense of its capacity, supply as much as 50 amperes of continuous discharge and 100 amperes in interrupted discharge, for a special strain, for instance.

With the normal discharge in 5 hours the mean available difference of potential of the element is 1·9 volts, and the capacity 105 ampere-hours. Each element of 7·5 kg. supplies at the normal *régime* 40 available watts and contains an available energy equal to 200 watt-hours.

The specific constants of the element are, therefore, as follows, as compared with the *total* weight:—

Specific output, in amperes, per kg.	3
Available specific power, in watts, per kg. ...	5·3
Specific capacity, in ampere-hours, per kg. ...	14·6
Available specific energy, in watt-hours, per kg.	26
Specific weight in kilogrammes per kilowatt ...	190
Specific weight in kilogrammes per kilowatt-hour	37·5

At the *régime* of 5 watts per kg., the Fulmen accumulator contains, therefore, more than 25 watt-hours per kg. These two figures are sufficient to calculate the weight of accumulators necessary to work an automobile of a given total weight, at a given speed on a given track, the efficiency of the motor and the transmission being known, and also the road to be traversed between two successive charges. If the *régime* of continuous specific discharge be doubled and brought to 10 watts per kilogramme, the specific energy falls to 20 watt-hours per kilogramme. If we do not require more than 100 kilogrammes of accumulators to produce 1 kilowatt, we should require 50 kilogrammes (instead of 40) to store up 1 kilowatt-hour.

If, on the contrary, we reduce by half the specific *régime* of continuous discharge, the available specific energy increases and attains to 30 watt-hours per kilogramme.

In calculating the weight of a battery, therefore, we must not lose sight of the fact that we lose in energy what we gain in power, and *vice versâ*, and that accumulators wear much better when they are subjected to more moderate *régimes* of discharge. In their special application to electro-mobiles, the discharge is not continuous, but, on the contrary, extremely variable, and interrupted by intervals of rest favourable to the diffusion of the liquid, which diffusion is also facilitated by the agitation of the elements during the journey The figures given for the normal *régime* may therefore be accepted as representing the energy actually available, notwithstanding the variations in the output.

As regards the duration of the elements we can give no figures as there is too great a difference between the conditions under which they work in the laboratory and on the road. We shall gain more information on this important point as electro-mobiles become more extensively used.

We had intended to publish the conditions of working of other types of accumulators applied to automobiles, but we found that they were nearly all considerably inferior to those we have just described relating to the "Fulmen" accumulator. As each maker or inventor claims in favour of his apparatus special advantages as to solidity, duration, cheapness, facility of arrangement, &c., which more or less compensate for inferiority in output and capacity, we did not think it expedient to challenge claims and contradictions.

The figures which we have given, and which are deduced from our own experience, represent the maximum of what can be obtained from the *present* accumulators while we are waiting for better, in defiance of the proverb that says "Let well alone."

The accumulator question is attracting universal attention just now, and we would readily believe that the present maximum is merely provisional. But such as it is, it enables us to realise practical electro-mobiles capable of making daily journeys of 50 to 60 kilometres without being recharged.

The competition for electric cabs to be held by the Automobile Club in June, will be a reliable experimental confirmation of our deductions.—*L'Energie Electrique.*

REVIEWS.

Treatise on Chemistry. Vol. II.—The Metals. By Prof. Roscoe and Schorlemmer. London: McMillan & Co., Limited. 1897.

This is the third edition of one of the most important volumes in the great work first issued by the authors in the early part of 1878. During the 19 years which have elapsed since the publication of the first edition of this volume, much important work on the chemistry of the metals and their compounds has been done. So much, indeed, that the time was ripe for a new edition in which the metallic elements and their compounds should be re-arranged and all new matter of importance added. Prof. Roscoe and his assistant have had a large mass of material from which to make their selection, and on the whole, those who are familiar with the first two editions will conclude that they have generally exercised their judgment well, and have not failed to realise the significance of the new discoveries.

The new edition is more bulky, but fortunately, it has been possible to condense much of the old matter and even to reject some, so that the volume before us is not too ponderous. This is a great advantage, for, in the early editions, the metals used to be dealt with in two volumes.

To review this work from the point of view of the metallurgist is scarcely within our province, but we have no doubt whatever that those who are interested in the chemistry of metals will give a whole-hearted verdict in favour of this new edition, which we are sure they will find to be a veritable mine of unusually accurate information.

A treatise on the metals, their chemical and physical properties, would not be complete without alluding in the proper places to the achievements of those who have sought to increase our knowledge of electricity within the past 20 years, and this has been done to some extent. We humbly suggest, however, that the work would have been far more valuable if the editors had drawn more copiously upon these achievements and had made more of them. We even venture to say that the work would have been more valuable if an electrical engineer thoroughly conversant with the researches of the past 20 years had been associated with them in their labours, for the purposes to which the metals are now placed in the electrical industries are so numerous and important that they cannot be overlooked. It is only in this direction that we can detect any serious weakness, otherwise the work is, humanly speaking, complete.

In a treatise on the metals, extending to nearly 12,000 pages, one might surely expect more than a page on the subject of conductivity; this is all that is devoted to it, and the subject is only considered with conductivity for heat under the heading of "Physical Properties in relation to the Periodic System." Actually in describing the physical properties of silver, we are only informed that it is the best conductor of electricity; and under the physical properties of copper, the only statement is that next to silver it is the best conductor of electricity, and that pure copper is very largely employed for electric light mains and subterranean constructions, and that small quantities of impurities lower the conductivity to a large extent. We should have thought that metals possessing this property to such a high degree would have been written about somewhat differently, and that wherever the physical properties of metals were stated, the values of their electrical conductivities would have been given. But we have searched for them in vain. Generally speaking there is a great dearth of physical constants.

Another instance of unbalanced treatment in dealing with electrical matters is to be found on page 319, where the electrolytic preparation of copper is described in 18 lines, yet the electrotyping process, which is surely a matter of less importance, receives more than two pages.

In dealing with the velocity of reaction we miss any reference to recent German researches on the velocity of ions.

Spectrum analysis and the methods of producing emission spectra are very fully dealt with as might be expected from one who has done so much himself in this direction; indeed, this part of the work is very complete.

There is a very good section on the constitution of salts and bases in dilute solution, but, strange to say, no reference to Arrhenius, Nernst, and the other great investigators in this field of research. It seems impossible to have omitted a full explanation of the electrolytic dissociation hypothesis, but such is the case. Indeed, the editors of this edition do not seem to have realised the important progress which has been made in electrolysis, not only as regards theoretical matters, but in practice; and so we look in vain for any reference to recent achievements in the direction of producing chlorates, hypochlorites, &c., in this way.

We should have thought that the work would not have gone to press too soon to have included some reference to Karl Elb's recent research on electro-chemistry. We miss him in common with many others of greater and less rank.

The authors had a great opportunity when writing up aluminium, but they do not call our attention to the phenomenal progress which has been made in the industrial application of this metal during the past 7 or 8 years, and the electrolytic production of aluminium is dismissed in about half a page. Some of the data too are wrong. We might have been favoured with the authority for the statement that the electrical energy required for the production of 1 lb. of aluminium amounts to 3,730 watt-hours. In describing the Héroult process in use at Foyers, the statement is made that the alumina is melted without the addition of a flux, and is then simply electrolysed. But the fact is, that alumina itself is practically infusible, though it dissolves readily in several salts which melt at a reasonably low temperature. In practice cryolite is found to be the most suitable with the Héroult cells, and this is used by the British Aluminium Company. The bath is filled with molten cryolite which is constantly fed with alumina as the aluminium is deposited. If the cryolite is not a flux, it is certainly a solvent for alumina and most, if not all, will imply this if they speak of cryolite as a flux. Loose statements of this kind ought not to have crept into such a work.

Turning to platinum we find as, indeed, we do with nickel and others of the metals which are more interesting to our industry, that data which we may reasonably expect to be present are conspicuous by their absence. The position of platinum in the electrical industries ought certainly to have been defined.

The last chapters in the book deal with the newly discovered elements of helium and argon, and practically constitute abstracts of the more important papers which have appeared, and with which our readers are familiar. We were expecting too much, perhaps, when we looked for some pronouncement on the fact that the existence of these two elements is not in any way indicated in the periodic arrangement of the elements, yet it is probable that their discovery will lead to modifications of that hypothesis.

As a treatise on chemistry, the work will probably satisfy chemists and also metallurgists of the older school, but the up-to-date metallurgist and especially electrical engineers who are interested in electrolysis will find it somewhat disappointing.

The book is executed in Messrs. McMillan's well known style, it is well printed, well illustrated, and suitably bound, and though as a treatise not perfect from our point of view, will, we are quite sure, be welcome wherever the chemistry of the metals is studied.

Alternating Currents of Electricity. By Alfred Still. London: Whittaker & Co. 1898.

This book, says the author, is written less from a scientist's point of view, and more from an engineering standpoint, than is usually the case; and not only for engineering students, but also for those engineers who are but slightly acquainted with alternating current problems.

There are, doubtless, many electrical engineers who, while possessing an extensive practical acquaintance of alternating current machinery, are ignorant of, or, at any rate, have but hazy notions of the principles underlying the design and working of such apparatus. To write a book meeting the requirements of this class of reader demands an author whose knowledge of the subject is good in both theory and practice, and who at the same time possesses the aptitude of expressing his ideas simply and clearly.

As far as we can judge, Mr. Still appears to satisfy all these requirements. His production is undoubtedly one which will appeal to a large class of readers. His preface is a little misleading where he states that the introduction of mathematics has been entirely avoided, since there are instances of the use of differential coefficients to denote rates of change; but such insertions are so carefully explained that no exception can be taken to them.

In the explanation of the various phenomena due to self-induction, capacity, &c., liberal use is made of graphical methods.

In general, the explanations given are scientifically sound and clearly stated. On page 119, however, the explanation of the constancy of the cycle of magnetisation in a transformer core for varying secondary loads is rather loose. We presume Ohm's law has an extended meaning given to it here. Moreover, would Ohm's law necessarily be violated in the primary, if, on increasing the secondary load, the maximum value of the induction varied? This is, however, but one unsatisfactory passage in an otherwise uniformly excellent production. The book is well written, aptly illustrated, clearly printed, and free from typographical slips. We can heartily recommend Mr. Still's book to the class of readers for which he has ostensibly written it.

NEW PATENTS.—1898.

Compiled expressly for this journal by W. P. Thompson & Co., *Electrical Patent Agents, 322, High Holborn, London, W.C., to whom all inquiries should be addressed.*

11,153. "Improvements in electric arc lamps." Siemens Bros. and Co, Limited. (Siemens & Halske, Aktien-Gesellschaft, Germany.) Dated 16th May. (*Complete.*)

11,154. "Improvements in self-regulating driving pulleys applicable to the driving of a dynamo from a railway carriage axle and for other purposes." E. J. Preston. Dated May 16th.

11,155. "Improvements in secondary batteries or accumulators." F. King. Dated May 16th.

11,157. "Improvements in alternating current motors." W. Langdon-Davies. Dated May 16th.

11,175. "Improvements in switches for electric circuits." C. B. Callow and J. Eck. Dated May 17th.

11,185. "Improvements in starting devices for monophase electric motors." E. B. Wedmore. Dated May 17th.

11,255. "An improved means or apparatus for reducing or extinguishing the electric arc formed on breaking electric circuits." R. H. Fowler, C. J. Hall, and R. Acock. Dated May 17th.

11,278. "Improvements in step-by-step printing telegraphs." W. S. Steljes. Dated May 17th.

11,282. "Improvements in electric check clocks or alarm signal apparatus." H. Reich. Dated May 17th.

11,290. "Improvements in electric arc lamps." P. R. Jackson and Co., Limited, and L. C. H. Mensing. Dated May 17th.

11,292. "A new and improved electrical gas lighter." J. De Meza. Dated May 17th.

11,293. "A new and improved theatrical ticket or check." A. Marsh. Dated May 17th.

11,302. "Improvements in or connected with electrical switches." A. Brier. Dated May 18th.

11,307. "Improvements and modifications in the construction of amperemeters, voltmeters, wall meters, or the like." A. Spark. Dated May 18th.

11,320. "Improvements in electrical ignition apparatus for gas burners." R. J Urquhart. (The Actien-Gesellschaft fur Fabrikation von Broncewaaren und Zinkguss, vorm. J. C. Spinn & Sohn, and S. J. von Romocki, Germany.) Dated May 18th.

11,326. "Improvements in adjustable reels, leads, and other similar purposes." W. H. Sturge. Dated May 18th.

11,340. "Improvements in or connected with electric batteries." E. A. Jahncke. Dated May 18th.

11,353. "Improvements in or connected with commutators for dynamo-electric machines and electric motors." C. J. Ferguson and G. T. Ferrell. Dated May 18th.

11,360. "Improvements in globe holders for enclosed electric arc lamps." K. Weinert. Dated May 18th.

11,396. "Method of producing foot-plates for electrotypes, stereotypes and the like and foot-plates thus produced." V. H. Holm. Dated May 19th.

11,416. "Improved method of and apparatus for signalling or advertising by electricity." A. Ginisty and V. Metz. Dated May 19th.

11,426. "Improvements in electrically propelled vehicles." The Hon R. T. D. Brougham and W. C. Bersey. Dated May 19th.

11,429. "Improvements in electrically propelled road vehicles." O. Patin. Dated May 19th.

11,433. "Improvements in prepayment electricity meters." F. F. Yeatman. Dated May 19th.

11,438. "Improvements in electrical furnaces." Siemens Bros and Co., Ltd. (Siemens and Halske Actien-Gesellschaft, Germany.) Dated May 19th. (*Complete.*)

11,440. "Improvements in dynamos." G. Unterberg. Dated May 19th. (*Complete.*)

11,455. "An improvement in automatic electric circuit breakers and restorers." G. E. Fletcher. Dated May 20th.

11,498. "An improvement in holders for electric glow lamps." H. C. Gover and C. F. Proctor. Dated May 20th.

11,499. "Improvements in resistance switches." H. C. Gover and C. F. Proctor and A. H. Bate. Dated May 20th.

11,506. "Improvements in or connected with telephones." J. E. O. Kumberg. Dated May 20th.

11,518. "Improvements in electrical lighting devices for kerosene and other burners." S. M. Meyer. Dated May 20th. (*Complete.*)

11,519. "Improvements in electric brakes." H. P. Davis. Dated May 20th. (Date applied for under Patents, &c., Act, 1883, Section 103, October 22nd, 1897, being date of application in United States)

11,525. "Improvements in and connected with electrical switches." E. J. Wade and the Electric Motive Power Company. Dated May 20th.

ELECTRICAL PATENTS OF 1884, EXPIRING IN JUNE, 1898.

We are informed by Messrs. W. P. Thompson & Co. that about 80 applications for electrical patents were filed in the month of June, 1884. Out of these applications some were never completed, and of those that were, not one has been maintained to run its full length of term, viz, 14 years, but became void after a period of a few years.

THE

ELECTRICAL REVIEW.

VOL. XLII. JUNE 10, 1898. No. 1,072.

CONTENTS:

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON.

Telegraphic Address: "AGEEKAY, LONDON." Code A B C.

Telephone No. 988 Holborn.

All Letters should be addressed to the Proprietors, H. Alabaster, Gatehouse & Co.

ADVERTISEMENT RATES ON APPLICATION.

The "Electrical Review" is the recognised medium of the Electrical Trades.

SUBSCRIPTION RATES.—In *Great Britain*, Post Free per Year, 19s. 6d. To all other countries, per Year, £1 4s.

BINDING.—Subscribers' numbers bound, including case, for 4s. each volume.

CASES.—Cloth Cases for Binding can be had, price 2s. 6d. each.

READING CASES, to hold from One to Twenty-six Numbers until the Volume is complete for Binding, can now be had from the Publishers, Price 6s. or Free by Post (in Great Britain), 6s. 6d.

FOREIGN AGENTS.—*New York:* D. VAN NOSTRAND, 23, Murray Street. *Paris:* VEUVE J. BOYVEAU, 22, Rue de la Banque. *Berlin:* ASHER & Co., 5, Unter den Linden.

Cheques and Postal Orders (on Chief Office, London) to be made payable to Mr. H. ALABASTER, 4 Ludgate Hill E.C.

DYNAMO DESIGN IN THE UNITED STATES.

AT the Electrical Exhibition, which was recently opened in New York, a large number of machines by different makers are on view, and our contemporary, the *Electrical World*, has taken this opportunity of comparing the several designs, and has drawn therefrom certain conclusions as to the direction in which modern practice is moving. These conclusions are published in a recent editorial, and as the subject will probably be of interest to many of our readers, we propose to briefly enumerate some of the leading features mentioned. First, we learn that multipolar machines steadily grow in favour as compared with two-pole machines, and that slow speed machines are now made multipolar for as small an output as one-half horse-power. Steel is not so much used as formerly, a common construction now being to use cast-iron yokes with cores or pole tips of wrought-iron plates from one-eighth to one-quarter inch thick. The yokes are generally circular in form, and wide enough to entirely cover the magnet bobbins; these latter being often further protected from possible mechanical injury by arranging an inward flange at each side of the yoke, so that the bobbins lie in a sort of trough. With regard to the magnet winding, it is stated that edgewise tape winding is beginning to be used for the series coils. Smooth core armatures, we are told, have practically disappeared from up-to-date design, deep parallel-sided slots about half the width of the teeth being most frequently used, although some makers prefer an overhanging tooth with a very small gap between the tips of adjacent teeth. In this case no bands are used, and even with the parallel slot bands are often replaced by the insertion of long strips of wood running the whole length of the armature, and held in place by being fitted into notches just beneath the tips of the teeth. A notable feature of modern design is the increased induction in the air-gap, the use of enlarged pole pieces to increase the area of the air-gap having been largely abandoned; whilst in some cases this increasing of the magnetic density is carried to the point of bevelling the magnet cores at the poles so as to reduce the area of the air-gap below that of the magnet limb. The object of this design is to reduce as much as possible the distortion of the field under load, and this practice has arisen owing to the demand for a machine that will run sparklessly without changing the position of the brushes from no load to 25 or 50 per cent. overload. The carbon brush is almost universally used, even for 100-volt machines, and is invariably arranged radially or nearly so; the brush-holders being of various designs, very generally carried on two rings, one positive and one negative, which serve both for mechanical support and electrical connection of the brushes at the same potential. With regard to commutators no great changes are noticed, except a tendency to increase the area of brush contact per ampere, this being done by increasing the diameter of the commutator whilst keeping the length unaltered. Although the exhibition does not include any examples of the very big output machines now made for traction and power transmission, it is, says our contemporary, of very great technical interest, and besides many examples of moderate-sized machinery of various designs, it contains a very good collection of dynamo and motor accessories, arc lamps, switchboards, and other apparatus.

Overcoming High Resistance in Crookes Tubes.

IN the *American X Ray Journal*, April, 1898, Dr. Graves makes some very interesting remarks on methods of restoring X ray tubes which have become "dead" by increase of resistance in use. He considers that by proper treatment any "dead" tube may be made to work again, without re-exhaustion, or without the use of restoratives, such as vapour emitters in side pockets. Dr. Graves's treatment consists in a rational combination of certain artifices already known and applied separately. The principal artifices employed by Dr. Graves to resuscitate "dead" tubes are reversal, spark-gaps, and tinfoil on the cathode end of the tube. He finds that in tubes of an ordinary resistance, the direct resistance is about three times the reversed resistance. When, therefore, the current refuses to pass in the proper direction, the chances are that it will be able to pass when it is sent in the reverse direction through the tube. If it is found impossible to send the current through the tube even in the reverse direction (when the leads are connected directly to the tube), then success will usually be attained by introducing a spark-gap between the tube and the negative terminal of the generator. Dr. Graves has repeatedly observed that a spark-gap at the negative pole reduces the resistance of a tube, while a spark-gap at the positive pole increases it. The reversed current is sent through the tube till the phenomena observed are the same as when an ordinary tube is reversed. Dr. Graves maintains that tubes that have been resuscitated in this way are far more efficient than new tubes which have not yet become "dead" by continued use. Dr. Graves's paper is well worth the study of those engaged in practical X ray work.

Some Notes on Boiler Trials.

IN making boiler tests, it is rightly observed by Mr. Schweder in his paper to the South African Association of Engineers, that complete trials are lengthy. He advises means whereby the action of a plant can be followed continuously. For this he would analyse flue gases frequently, so as to approximate the ideal of 15 per cent. of carbonic acid in the gases. Average analyses only showed 10·8 per cent., and once only had he found 15 per cent. The Arndt econometer is recommended as giving, with a fair degree of accuracy, the ratio of CO_2 in furnace gases, and it will justify its title if the fireman can be induced to fire to its indications, either by pride or by a bonus on results. We drew attention to this instrument when it first came out, and advised its employment as a means of paying firemen by the piece, so to speak—that is, by the proportion of CO_2 they manufacture. Furnace temperatures are computed by means of a piece of copper held in a piece of gas pipe a few inches above the fire. The copper is quenched in water, and the temperature computed from the final temperature and specific heat. Mr. Schweder has had made a new instrument for measuring the velocity of the furnace gases for the purpose of showing the amount of air that is being used for a certain amount of coal. It is not clearly described, but appears to record by means of a nearly horizontal water-gauge tube such that a little difference of head gives a long range of reading. The instrument is the design of Prof. Buknagel, and should Mr. Schweder read this, we hope he will send us a drawing and full description for our columns.

The Magnet and the Spectrum.—Mr. F. Charles, of Bristol, writes the following very interesting letter to the *Engineer* as follows:—"At a time when so much attention is being paid to X rays and new developments of the theory of light, it will not be inappropriate to direct attention to a passage in the *British Cyclopædia*, published by Orr and Smith, Amen Corner, in 1835. The passage in the article on 'Spectrum' runs as follows:—'One of the most extraordinary effects which has resulted from the action of coloured rays is the communication of magnetic powers to metallic bars. Dr. Morichini, of Rome, was the first person who discovered the properties which he considered were confined to the violet rays. At that season of the year when the light of the sun is most powerful, he admitted it into his chambers, and having formed a coloured spectrum by means of a prism, he collected the violet rays in the focus of a convex lens, and by moving the lens parallel to a steel needle, he made the focus of the violet rays pass from the middle of one extremity of the needle to the other, and always in the same direction, without touching the other half. By continuing this operation for nearly an hour, the needle was found to be completely magnetised. . . . . The same result was obtained by Dr. Carpi at Rome, and Mr. Cosimo Redolfi at Florence. . . . When the violet light was passed through the thick smoke of burning sugar, the needle showed only a very slight degree of magnetism.' Further on it is explicitly stated that in 1817, when Dr. Playfair was in Rome, he saw the same experiment carried out with perfect success. Perhaps some of your readers can tell me whether these statements are true or not."

The Ameer and the Dynamo.—In the whole annals of the engineer in the East, probably no man has achieved in so short a time as honourable a record of difficulties overcome and conspicuous success attained from the smallest beginnings as Sir Thomas Salter Pyne, C.S.I., M.Inst.M.E., and C.E. The extent of confidence reposed in his ability by H.H. the Ameer of Afghanistan has been more than justified by the varied and far-reaching industrial developments which, under the enlightened patronage of the Afghan ruler, Sir Salter has created in the midst of an unsympathetic and fanatical population. The story of Sir Salter Pyne's rapid success is a testimony to his solid worth of character and indomitable energy in a position from which a predecessor, after a short inspection of Kabul amenities, hastily retired dismayed. To enter a country in which the worst traditions of the East prevail, his only guarantee the somewhat filmy protection of a ruler suddenly become interested in mechanics, as a child might be in watching wheels go round, to retain that interest and form it in the direction of serious work, to erect and equip workshops, foundries, mills, and to establish a dozen or more useful industries, and, above all, to make 3,500 skilled mechanics out of the typical Oriental material before him—all this is surely an achievement which can only be described as grand. The solid fact of this industrial activity set going in a land amongst a people whose energies knew no other outlet than that of warring against their neighbours, is sufficient to place Sir Thomas Salter Pyne in the front rank of the pioneers of civilisation. Great things often originate in small beginnings, and this great enlightenment of the Afghan people may be traced to a dynamo which one day the Ameer, when on a visit to India, lingered to watch at Rawal Pindi. It is from this incident that the great interest in applied mechanics which the Ameer now possesses may be dated, and which has given the subject of our note the opportunity of which he has so well availed himself. The Ameer retained the services of the engineer in charge of the plant, who happened to be a Frenchman, but that gentleman, after a brief experience of Kabul, took an early opportunity of returning to his beloved boulevards. He was succeeded by Mr. Pyne, and from that date Sir Salter's career has been one of uninterrupted success, not only in his own professional lines of activity as a civil and mechanical engineer, but also in the more exacting domain of confidential agent to the Afghan ruler.

APPLICATIONS OF ELECTRICITY ON A MODERN WARSHIP.

There is little doubt that the Americans are far ahead of us in their applications of electricity on board ship, and if only Admiral Sampson can force the Spanish fleet, now said to be "bottled" up in Santiago de Cuba, to a pitched battle, it is possible that the lessons which electrical engineers will learn from the fight will be as important in their way as those which will be gathered by students of naval strategy, and of armour *v.* gun.

Even the most sanguine of electrical engineers do not look forward to the use of electricity in propelling warships: at any rate, they do not expect that this method will be adopted in the near future; but they are without doubt right in claiming that electricity is by far the best source of power for driving the auxiliary machinery of the modern man-of-war. The American naval authorities, more than those of any other country, have realised the importance of this, and should a really serious action take place between the hostile fleets, we shall eagerly watch for official reports on the behaviour of electrical systems in actual warfare.

The presence of steam and exhaust pipes anywhere outside of the main engine and boiler compartments is undesirable, especially in the crews' living quarters, where the heat that they produce in confined spaces densely inhabited is particularly bad. In addition, the presence of complicated steam appliances in various parts of the ship adds to the work of keeping the vessel clean. These, however, are minor disadvantages. A greater one is the obvious danger in action from steam pipes placed above the protective deck. This is met by placing below the protective deck all auxiliaries whose use would certainly be necessary in battle, and by shutting off steam from all the rest below the protective deck when the ship is cleared for action; but the capstan and the winches must be on deck, and their use may become imperatively necessary in action. The cutting of the steam pipe, above the protective deck, to any of the machinery, would render some of the ammunition-passing rooms entirely untenable until steam could be shut off from below, to say nothing of the probable loss of life and disastrous moral effect.

By far the most serious objection to these auxiliaries, however, is their lack of economy. Everybody knows they are wasteful, but just how wasteful it is difficult to say, because of the rarity of tests under service conditions. About a year ago, however, engineer W. W. White made a series of very careful experiments on the auxiliaries of the *Minneapolis* (U.S. Navy). In these experiments the condensed exhaust was measured and indicator cards were taken from 13 different auxiliaries, beside the dynamo engines, including main and auxiliary air and circulating pumps, pumps for feed, fire, bilge, flushing, and water service, one forced-draft blower, and the ice machine. The mean result from these 13 was 99·522 lbs. of feed-water per I.H.P. per hour. The greatest economy was shown by the middle circulating pump engine, a simple, vertical, two-cylinder, inverted, direct-acting engine, with slide valves, actuating two centrifugal pumps. At the time of test the pump was working under its full load. The consumption was 55·06 lbs. of feed-water per I.H.P. per hour. The least economy was shown by a horizontal duplex pump, 12 inches × 8½ × 10. At the time of test it was making an average of 12·7 double strokes per minute on a very light load. Its consumption was 318·68 lbs. of feed-water per I.H.P. per hour.

These results are certainly startling. We have, of course, always known that the auxiliaries were very extravagant in the use of steam, but who supposed that there were engines to-day using from 100 to 300 lbs. of steam per I.H.P.? In an official summary of tests to determine the consumption of steam of the main and auxiliary engines, we find there are 34 auxiliaries having in all 52 steam cylinders. Thirty-one of these engines were indicated, giving an aggregate of 471 H.P. developed, using collectively 56,049 lbs. of water per hour, or an average of 119 lbs. per I.H.P. Were these auxiliaries as economical as the main engines, 9,891 lbs. of steam would have developed the same power. 46,158 lbs. of steam or water being used *more than is necessary* if the best conditions of economy prevailed. In other words, the data show that at 8 lbs. of water evaporated per 1 lb. of coal, 5,769 lbs. of coal can be saved per hour.

It must, of course, be borne in mind that it is impracticable to realise this gain because of the complications which would follow the introduction on board ship of high-expansion engines for these numerous purposes, but the question is, shall these numerous engines for so many purposes be replaced by fewer engines of higher character and have a few central-power plants capable of meeting similar wants with greater economy; or shall we design more economic engines for each individual condition, even at the cost of a slightly increased number of parts; or shall we have one more economical central steam-plant developing power to be distributed by electricity to the varied requirements in different parts of the vessel?

Wastefulness is inseparable from any system requiring the development of power in numerous independent engines of small power situated at a distance from the boilers. Under such circumstances the losses by radiation and condensation must necessarily be greatly increased. Then, too, the use of numerous small engines causes a great increase of the friction load. Worst of all, each of such small engines must be large enough to do its maximum work; hence, under service conditions, it must often work at low power with great waste of steam.

These troubles can be avoided by the use of one power plant for all the auxiliaries. Such a plant for a large man-of-war could be divided into a sufficient number of units, so that the generators in use could always be working at nearly their full load; and at the same time the units would be so powerful that compound engines could be used with consequent economy. In addition there would be the gain from the substitution of a few large engines for many small ones. The plant, of course, would be placed near the main boilers, avoiding much steampipe drop and condensation, would be below the water-line and well protected, and would keep its heat, dirt, and noise in the machinery space.

In the *Engineering Magazine*, Mr. George H. Shepard discusses the applications of electricity on modern warships, and indicates the direction in which it may be most usefully employed. He is a great advocate for central power plant. In order to run this to the best advantage by keeping its load as nearly uniform as possible, the distribution to the auxiliaries should be by electricity; the dynamos for electric lighting being continued to run by steam. By this means, when the night's lighting load goes off, the day's motor load could be put upon the same generators, instead of running two sets of generators, each at light load and heavy load alternately—a necessity under any system of distribution. There would, of course, be variations in the load; but electric light and power stations equipped with several units, operated by condensing engines, can run under wide variations of the total load, without greatly changing their steam consumption per I.H.P.

Electricity is very adapted to the conditions existing on board ship. The wires can be carried through water-tight bulkheads with less damage to the latter than that caused by the pipes necessary for any other system of distribution. For the short distances existing on board ship the transmission losses are negligible. In starting machinery electricity can be applied with a quickness, certainty, and safety attainable with no other power, except possibly compressed air, whilst distant motors can be controlled from the central station.

It must be admitted that most naval officers regard electric machinery on board with distrust, so that at present it is chiefly used only for illumination, search lights, communication, and to some extent for signalling. Perhaps the dislike for electric machinery arises from the fact that electric call-bells and telephones on board ship frequently get out of order, whilst a fault in the electric mains is hard to locate, but such disadvantages as have been experienced are probably due in most cases to the restrictions and interferences which electrical engineers have to contend with when putting in installations on board a man-of-war, for it cannot be said that electric machinery deserves a bad reputation, although the conditions on board ship are very trying to electrical appliances.

Naval architects should try and meet electrical engineers more leniently, for the advantages to be gained by giving electrical appliances a fair field are enormous.

Mr. Shepard carefully examines the advantages and disadvantages of replacing steam auxiliaries by electric auxiliaries, and puts his finger upon the chief difficulties in using complete installations of this kind. He concludes that although electric auxiliaries offer many advantages, their great cost and the amount of space they would occupy render a complete installation of them of doubtful benefit, while their great weight makes it absolutely out of the question under present conditions. It is to be expected, therefore, that the present mixed system of power distribution will continue aboard ship, possibly as long as the steam engine remains the prime mover, but that electric appliances will never occupy a much more important place there so long as present ideas obtain. However, there is every reason to hope that, with continued progress, both amongst makers and users of electric machinery, it will gradually become more and more adopted aboard ship for those purposes for which it is peculiarly fitted. The necessary power will probably be furnished by a gradual expansion of the present electric light plant to meet the new demands. What the limit will be depends upon the future improvement in electrical appliances, especially in the matter of weight, and upon an increased disposition among naval constructors to design their plans in such a way that whilst the efficiency of a man-of-war as a fighting machine shall not be impaired but enhanced, more scope shall be allowed and more opportunity given to the electrical engineer for the practical solution of those difficult problems connected with the distribution of power to auxiliary engines.

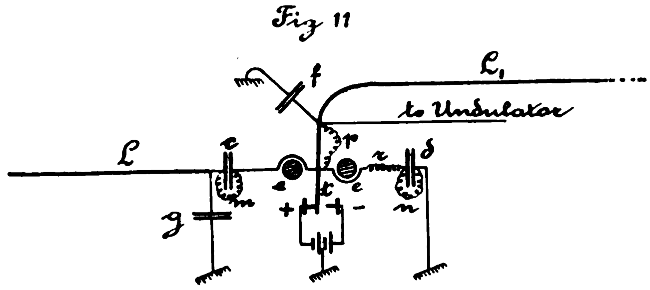
VIBRATING CABLE RELAY.

By K. GULSTAD.

(*Concluded from page* 752.)

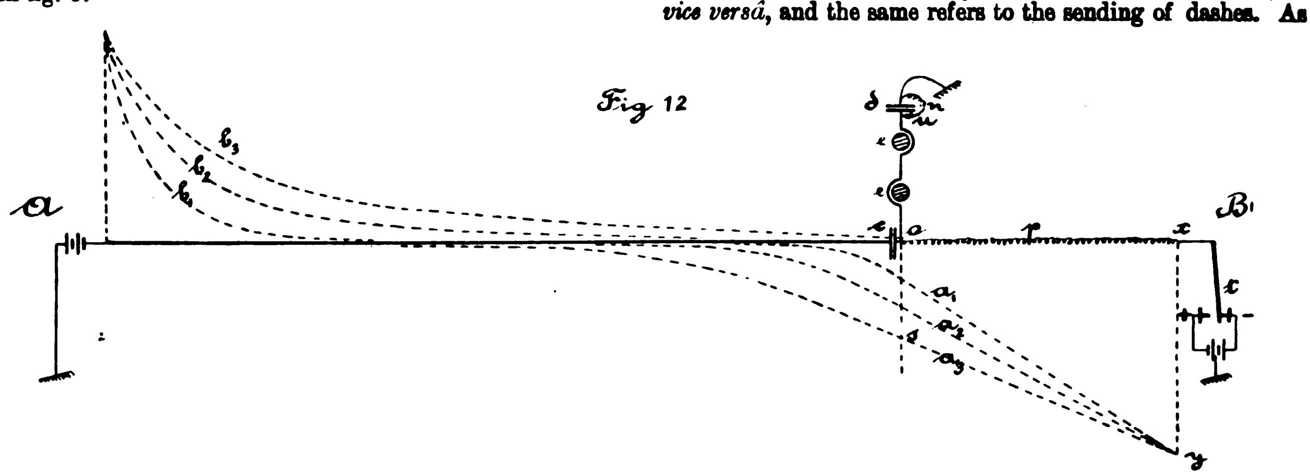
It is not always necessary to employ special windings for the vibrating current; some advantage might possibly be gained by an arrangement, as in fig. 11, or in principle as sketched out in diagram, fig. 12, where the tongue, for the

Fig 11



sake of clearness, is placed apart from the electro-magnets, and where the resistance, p, for the same reason, is joined up as in fig. 5.

Fig 12



To limit the subject, I shall try to explain the working of the relay arranged in this manner only.

Let us suppose that the vibrating apparatus is put into action by switching the resistance, p, fig. 12, on to the cable at point o, while the transmitter at the sending station, A, sends a series of dots into the cable, p being chosen so that the rate of relay impulses is the same as the rate of dots.

Considering the instant, when the armature has been moved against, say, the right-hand contact, a negative current is sent through p into the cable end at the relay station, B, thereby decreasing the potential throughout the line. In fig. 12 this decrease at different periods of time is roughly illustrated by the potential curves, a_1, a_2, a_3, the ordinates at any point representing the potential, which, at the tongue, is $x\ y$. This fall will evidently continue till the potential at point o has dropped to, say, $o\ s$—*i.e.*, so far, that the negative current through the relay windings is sufficiently strong to move the armature and press the tongue against the left-hand contact, whence a positive current is then sent into the cable, &c. The time elapsing from making till breaking contact thus depends upon the potential at o due to the relay battery, and it is further evident that the time also will be influenced by the sending current, that tends to increase or decrease the potential, as the case may be. In fig. 12 the potential curves for a positive sending current are indicated as b_1, b_2, b_3. If a positive sending current increases the potential at o a little just before it has fallen to $o\ s$, the time for the reversal of the tongue will be prolonged. If the sending current, on the other hand, is negative, the time will be shortened. In general, the interference of the sending currents will therefore, after a little while, bring the vibrations of the relay tongue into unison, and practically into synchronism with the reversals of the transmitter, and in such a way that, while the transmitter sends a positive current into the cable, the relay will send a negative current into the cable at the other end, as well as into the line L_1, fig. 11, or *vice versâ*.

How soon this synchronism is established depends, of course, upon the strength of the line current; suffice it to say that a relatively weak current will soon be able to control the motion of the relay armature, even if the resistance, p, is not exactly corresponding to the rate of dots. In case the action of the dots is quite negligible, sufficient synchronism would, however, be established as soon as the action of the dashes commences; all that is wanted is that the influence of these signals of longer duration are strong enough.

From this it will be seen that only positive and negative dashes at certain intervals are necessary for signalling, it being of minor importance whether the dots penetrate or not, as the relay itself will fill up the intervals between the dashes and spaces with the number of dots needed. Obviously the very circumstance that this Morse code signalling can be practised by means of dashes and spaces, involves the possibility of increasing the working speed of cables or long landlines, where vibrating relays are employed.

When I have mentioned the arrangement, fig. 11, as probably being preferable to that shown, fig. 10, it is not only for the sake of convenience, but also because a partial diminution of the effect of the charge appears to be attainable.

Referring again to fig. 12, it has been pointed out that whenever positive dots are sent into the line from A, a negative current is simultaneously forced into the cable at B, or *vice versâ*, and the same refers to the sending of dashes. As the current direction through the cable is the same, a portion of it nearest B will be charged oppositely to the length of cable nearest A, the two charges being separated at a point of zero potential. Whenever reversals take place, a portion of these opposite charges will tend to neutralise each other, thereby diminishing the time for the succeeding re-charge from both cable ends. On account of the sensitiveness of the relay—even with pole-pieces quite up to the armature—a feeble charge only can be sent into the cable from B, in case p is placed as is fig. 5, and it is partly to try the effect of increasing the charge due to the relay current that I have applied p as described (fig. 6, &c.).

It has been mentioned that the effect of distortion will be diminished by making the relay vibrate in a proper manner (*vide* fig. 8). Going further into the matter it will be found that the diminution can be effected to a greater extent than might appear possible at the outset. The question of dots being of minor importance for high speed work, the formation of the dashes is the only one to be considered as regards the speed of signalling. To make up for the distortion of the dashes, the tongue must leave the contact on which it rests as soon as the time for the dash is elapsed. The decrease of the negative potential due to the relay current at o, fig. 12, must, for instance, correspond to the increase of the potential due to the sending current, or *vice versâ*, in such a manner that the differences between the resultant potential at o, and the equally varying potential at u, will cause the tongue to be reversed, whenever the relative strength of the cable current diminishes. Up to this moment the tongue will be kept against the contact by the attraction of the armature, which action will continue as long as the flow of electricity from B can be neutralised by the flux of opposite signed electricity from A.

In order to ensure a satisfactory working of the vibrating relay, it is therefore not sufficient that it vibrates at a certain rate; this can be attained in different ways, but it must vibrate so that the relay current through the windings also increases in a special manner. This can be accomplished by proper variation of the condenser capacity, or of the resistance r, of course, at the same time altering p for maintaining the rate of vibration. For the sake of extending this variation, a condenser, g, fig. 11, may sometimes be added with very good result.

The manner in which the variation of the condenser capacity affects the working of the relay is illustrated by the record of signals upon undulator slips marked figs. 13, 14, 15.

As to the regulation, the same holds good as for duplex working, it is chiefly a matter of experience, patience, and perseverance, although certain rules can be given. When, however, the right "balance" is found for the maximum speed, it is likely to be steady from day to day, and only to need small corrections. When the speed is lowered a new delicate adjustment of the condensers is not required, as it is generally sufficient to alter the resistances, p, and sometimes r.

Referring to fig. 8, it may be said that the regulation is intended to prevent the top of the dash or the space from extending much above or below lines m_1 and n_1 respectively. This is possible even with a series of dashes sent, from the fact that the vibrating relay also sends an equal series of negative dashes into the cable, thereby producing corresponding phenomena of charge.

The above regulation is dealt with as if it was undertaken from the receiving end only. It is, however, clear that the same thing can be done to some degree from the sending end, all the effects of variation of current—by altering the battery power, by compensation, by employment of sending condensers, &c.—being at once noticeable on a suitable recording instrument, such as the undulator. The manipulations at the sending end must at the same time only be looked upon as a means of facilitating the adjustment at the relay station.

By the use of the vibrating relay, the distortion of signals on undisturbed lines may be compensated for and eliminated to a considerable extent in conformity with the "balancing" applied in duplex working. The arrangement, fig. 11, is the same in several respects as the one employed in the differential duplex. "Bridge" connections may also be employed with good results—see fig. 16, where h, i are resistances.

The *modus operandi* for "balancing" is comparatively simple in principle. Let the transmitter station send a series of signals, including a certain number of dots previously agreed upon. The relay station, which switches on the vibrating current as soon as the signalling commences, regulates at first the resistance, p, fig. 11, till the right number of dots is obtained, and subsequently the condenser capacities and resistance, r, for correcting the dashes, then re-adjusting p, and so on.

The slip, fig. 17, records the effects of the transmitter

Fig 13

Fig 14

Fig 15

Fig 16

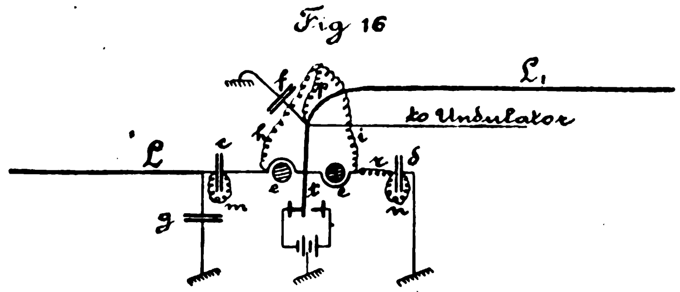


Fig 18

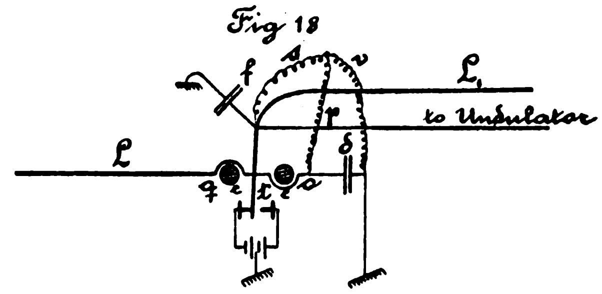

Fig 17

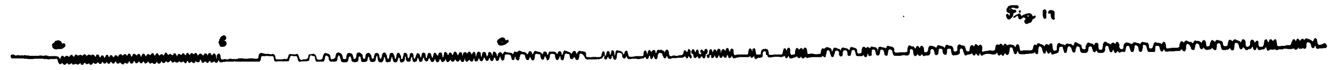

current when signalling begins. The vibrating current is put into action at a, the interference of transmitter currents commences at b, and the proper signalling at c.

The details of construction and the adjustment of the relay may influence the results obtainable considerably. The conditions of the line, L_1, may likewise affect the same, and I consider it, therefore, preferable sometimes not to connect L_1 directly to the vibrating relay, but to the tongue of another ordinary relay, worked by the former.

Regularity of the transmitter motion and constancy of the sending battery are also essential points to be observed, when the system is to be fully utilised.

The records in fig. 13 are very readable, yet it will be seen that the dashes are unproportionally large, and would possibly run together when the speed is increased. In order to increase the influence of the relay current, I may then reduce the capacity of d and likewise the resistance p, fig. 11, the result being as in fig. 14, that the signals become more distributed. Reducing the capacity much more would, however, not do—see fig. 15—as the relay current would then rise or fall too quickly (preponderate) and break the dashes, making the signals unreadable. In all three cases it will be seen from the 12 dots that the rate of vibration is the proper one.

B

It seems evident that the application of the vibrating relay is not limited to cables, but may be employed on long landlines also. The regulation for dashes and dots requires not be so very exact in the latter case, neither is this necessary on short cables nor when working long cables at low speed. The arrangement, fig. 10, would perhaps be convenient on landlines.* As to duplex working in connection with the vibrating relay, I don't see any objection for employing the same arrangement (fig. 10).

So much for the theory of the vibrating relay. By means of this a very considerable increase of speed on cables or on long circuits, undisturbed by induction, &c., may be looked for, when compared with ordinary relay work. I shall, however, not here suggest to what extent this is possible, the matter being new, and no doubt open to improvements in different respects. I have myself obtained a speed of 80 to 90 words per minute on an artificial line composed of resistances and artificial cables representing something like 700,000 K.R. The system has also been tried practically upon the Great Northern Telegraph Company's cables and landlines from Newcastle-on-Tyne to Gothenburg, *i.e.*, a circuit of about 580,000 K.R., with the result that upwards of 100 to 110 words per minute can be sent from Newcastle and translated at Gothenburg to Nystad in Finland, whenever the landlines are free from external disturbances; if such is not the case, the speed as a matter of course is considerably lower.

It should be mentioned that a modification of the vibrating relay arrangement as described above has been in use on this very cable for many years, and with a very satisfactory result. This modified arrangement—shown in fig. 18—is due to Mr. Falck, the Great Northern Telegraph Company's Superintendent at Gothenburg, who introduced it in order to facilitate the reversal of the relay armature, and who has since improved upon it in several ways. The speed attainable is 65 words per minute. It will be understood from fig. 18 that the direction of the marking current is the same here for the sending as for the relay current, and the diminution of the distortion is consequently caused by the proper variation of potential at the points o and q, both being of the same sign.

called variable zero. An increase of battery power will also to some degree be found advantageous for such instruments, when the condensers are diminished at the same time.

With regard to battery power, it is certainly a capital thing to be cautious, but when speaking of faultless cables, as made nowadays, with a thick insulating coating, occasionally tested with several thousands of volts, a much higher E.M.F. than is generally in use on cables, may doubtless be employed without risk.

Copenhagen, *May*, 1898.

CONSULTING ENGINEERS.

The company promoter is inclined to the belief that he is at liberty to ask an engineer to carry out tests on lines to be laid down by the promoter. It is possible to carry out a so-called test on promoter's lines and obtain results which, while representative of facts obtained under the given conditions, are by no means fair facts to place before a lay investing public.

Recently it appears that the British Hydraulic Jointing Company called in Sir Frederick Bramwell to report upon the invention to be worked or exploited by the company. Sir Frederick's report was lengthy and apparently not so favourable to the promoters as to make them afford space for it in the prospectus. The condition laid down by the author of it was that it must be published *in extenso* or not at all, and the prospectus simply stated that Sir Frederick had reported on the invention and his report could be seen at the office of the company. Of course, not one in a hundred investors would go to see it: they would conclude it to be favourable. But Sir Frederick wrote to the *Times* asking the public to read his report before investing. Many experts really do little else than follow out the instructions of promoters, and they prepare reports of no real value but very seriously misleading, while at the same time they write

Fig. 19

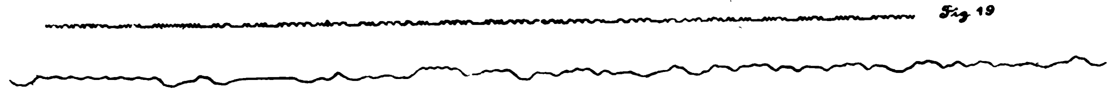

Fig. 20

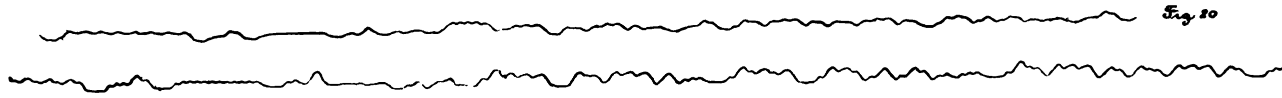

Fig. 21

To illustrate in some way what the influence of the distortion means, I may refer to the undulator records, figs. 19, 20, 21. Fig. 19 shows signals translated through the mentioned artificial line at a speed of 90 words per minute by means of the vibrating relay. Fig. 20 gives the signals sent through the line direct to the undulator at a speed of 80 words, and fig. 21 the same thing at a speed of 50 words per minute, the conditions being the same in all three cases as far as practicable. When the relay was worked in the ordinary fashion a signalling speed of only 21 words could be attained (impulses to be used).

In conclusion, I beg to remark that when I have limited the speed on the artificial line to 80 or 90 words per minute, it should be understood that this is effected by rather a moderate E.M.F. By increase of the battery power a somewhat higher speed would no doubt be obtainable according to previous trials.

The limit of speed appears, indeed, principally determined by the attenuation of the sending current, and not so much by the distortion of the signals, which can be neutralised, to a great extent, in the way shown. The attenuation can of course be counteracted by augmentation of the E.M.F. till the same has reached the limit which is considered safe for the cable.

The vibrating arrangement may, according to its mode of action, be looked upon as a contrivance for transforming the distortion into an attenuation of the current, *i.e.*, the very same thing which partly is done by condensers in circuit with receiving instruments working with the so-

* If arrangement fig. 11 is used, condenser c and resistance m may be dispensed with.

nothing which is not true. A bicyclist might run along a rut in a road and would be able truthfully to report he had had a smooth journey.

This would read well in a report, but it would not make the whole road surface good. Where an engineers' report is to be employed as a means of floating a company, we think he ought to report on everything he may find concerning the idea or project. Indeed, it is the consulting engineers' right to assume that no matter by whom he is called in, his client's object is to obtain the whole truth. As often as not, however, promoters merely want favourable reports, and are very apt to think they are badly treated when an engineer refuses to carry out a test on misleading lines. We do not think that an engineer called in to report on an invention purely as a piece of mechanism is bound to say that in his opinion it is a non-patentable invention; he naturally leaves such questions to the patent expert, and has a right to assume his employers to be honest enough not to ask the public for money until they have satisfied themselves that the patent is good. It appears from Lord Crawford's letter in reply to Sir Frederick that the report dealt with the question of validity of patents on which Sir Frederick had not been called on to advise, but on which he apparently felt bound to say something. We think in such a case if an engineer doubts the validity of a patent he might simply say, "as regards the patent I would advise you to obtain the opinion of some expert." We have known would-be promoters very strenuous in asking consultants to give them facts when they hoped or expected such facts to be favourable, and to be exceedingly annoyed when the facts were unfavourable. Whatever extent may be covered by an engineer's report, there can be no question that on the points he does deal with he should refuse to admit any course of action which makes for results that cannot be obtained commercially. A hard and fast rule to cover every case it is not possible to lay down. Every case must be its own law, and an engineer must necessarily be guided by what he finds in each case. He will find out for himself whether the intention of his employers be really honest or otherwise, and act accordingly.

PREPAYMENT METERS.

The popularity of a prepayment system in connection with artificial illumination is undoubted. It has strengthened the unsecure tenure of the gas companies by creating a handsome revenue from a section of the public which is commonly reputed to be beyond the civilising influences of quarterly accounts. Light is a necessity even to the submerged tenth, and the essential principles of prepayment were quickly grasped by it.

It was discovered that a pennyworth of gas went further than oil, and was immeasurably more convenient. The fact that it was infinitely safer than the devastating oil lamp may

Fig. 1.

not have counted for much, but no doubt the prepayment gas meter has operated very effectually in this direction. The prepayment system, however, has extended beyond the poorer classes of the community, and is not uncommon in the flats and domiciles of the well-to-do. With the success achieved by the gas companies so prominently displayed, it was not surprising that attempts should be made to apply the principle to electric lighting, and Mr. C. O. Bastian, whose electrolytic meter has been discussed a good deal of late, has been working on the subject for some two or three years. The prepayment electric meter devised by Mr. Bastian has gone through quite an evolutionary process before arriving at its present form, the chief modifications tending towards a simplification of the instrument.

This prepayment arrangement does not imply a special form of meter, for the device can be attached] to any of the well-known types of meter. The illustrations by which we shall strive to explain the working of the instrument show the prepayment mechanism applied to a Thomson watt-meter. The operation of the instrument, by means of a coin, is an interesting and ingenious one. Until a coin is inserted, the handle which projects from the cover is free to move; a coin, when pressed through the slot, falls into a groove, and forms a rigid connection between the handle and the interior mechanism, and a turn of the handle switches on the current. The arrangement of the meter will be better appreciated by referring to the detailed parts. Fig. 1 shows the meter and prepayment attachment entirely enclosed, which is the form in which the mechanism will be usually sold. Fig. 2 is front view of the meter, the only features to be noticed here being the coin receiver or shoot shown at O, and the pointers N, N, the exact function of which will be referred to subsequently. Fig. 3 gives a detailed view of the prepayment mechanism seen from the

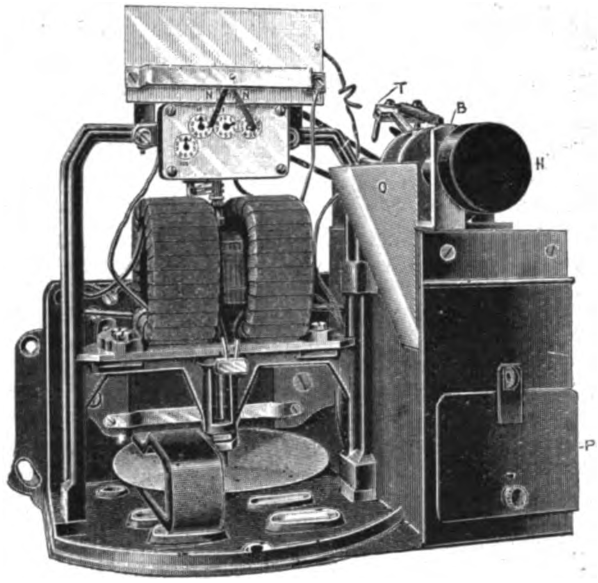

Fig. 2.

back of the meter. We will now follow the action of the apparatus. Upon the insertion of the coin at B, which makes a mechanical connection, the handle, H, is turned. One result of this is to operate on the pivoted end of the switch, T, which is depressed into the mercury cups, M, thus completing the circuit through the meter. The switch is held in the mercury cups, against the tension of a spring, by

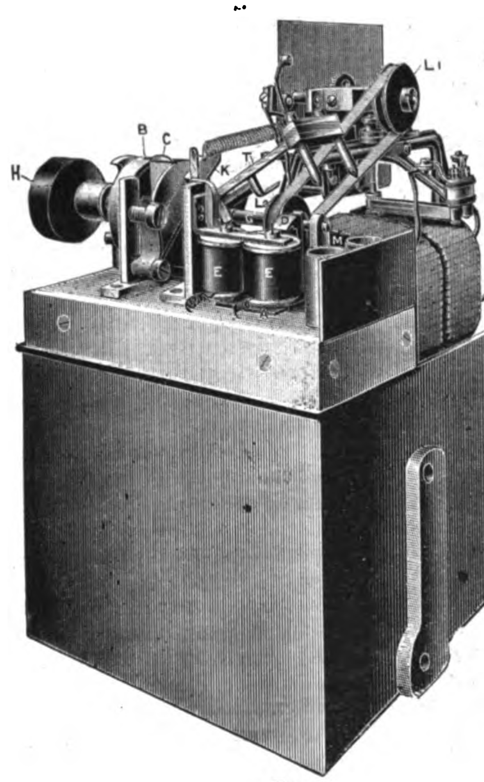

Fig. 3.

means of a clutch, D. The turning of the handle does more than merely put the switch on. In fact, the operation that we are about to describe is probably the most important in the complete action of the mechanism. Above the dials of the meter (fig. 2) will be observed two pointers, and the relation of these to one another is very important. The handle H, being in connection with a rod, G, its movement will cause a partial revolution of the pulleys, L_1 and L_2. These pulleys are connected together by means of a miniature raw hide belt; pulley L_1 is mounted on an axle, which carries one of the pointers already alluded to. It will be seen, therefore, that when the handle is turned, one of the needles, through the medium of the pulleys, is moved away from the other pointer, the exact distance of its movement being predetermined. The second pointer is geared to the train wheels of the meter, and when the switch has been put on by the agency of a coin, the meter commences to run, and the second pointer travels slowly after the first one. The exact distance it has to traverse before it overtakes the first pointer is a measure of the current consumed; in fact, the first pointer is caught up by the second pointer in a time inversely proportionate to the amount of current flowing through the meter. The distance that the first is separated from the second is determined by the gear wheels, which are proportioned according to the price per unit and the value of the coin with which the mechanism is intended to be operated.

The more coins that are dropped in, up to a certain limit, the further the first pointer will be separated from the second, and they will be a proportionately longer time in coming together. One side of the first pointer is insulated so that it can come in contact with one side of the second pointer with impunity. The other side, however, carries a platinum contact, and when the second overtakes it and comes in actual contact, a current of electricity at once flows round the electromagnet, E, whose armature is immediately raised, and pulls the clutch, D, away from the switch, F, which immediately flies into the off position.

From observations we have made the action of the meter seems to be certain, and the instrument ought to meet with considerable success.

THE YARMOUTH BREAKDOWN.

The report of Mr. Preece upon the recent breakdown at Yarmouth is a little curious for two reasons. He does not advise the use of separators for the prevention or, rather, dealing with priming water. One reason is the heavy expenditure, £250, that would be involved. Granting that the expense would be so much, is the sum an extravagant one as an insurance against such a breakdown as occurred? which must have involved an expense directly and indirectly very much greater than £250. Then, again, if separators are what they profess to be, can it be held that a station is complete without them and, their omission having proved so provocative of disaster, ought not such omission to be remedied at once. Further, the wasteful effect of wet steam is such that if separators do their duty the economy in fuel which they bring about must be such as to very amply repay the expenditure upon them. Every pound of water separated from the steam represents the destruction in the cylinder of steam probably equal or nearly equal in amount to the water. Separators are not merely to be regarded as such for safety but also for economy.

But Mr. Preece did not stop at one reason. As a rule separators are provided with a water-gauge and are blown out periodically by the attendant when a given amount of water has been collected, and any neglect to do this may lead to the very disaster intended to be averted. This is correct, but it ought not to be. Separators ought to be drained automatically. The ordinary steam trap which, of necessity, discharges water at a temperature above the atmospheric boiling point, is looked upon as a nuisance, for it practically discharges steam. What is wanted is a good steam trap of large opening discharging into a closed pipe which may be carried to the suction side of the feed-pump whereby all water is returned to the boilers. Where the arrangements are suitable steam separators may be drained direct to the boilers, but not below water-level, and they should have discharge pipes as large and direct as possible.

In a station recently inspected by us there were separators not merely to each engine, but also on the main steam pipe, which we regret to say was a ring main, an appliance far more likely to cause trouble and breakdown than to prevent it or safeguard against its occurrence.

METROPOLITAN RAILWAYS.

The problem of fitting the Metropolitan Railway with electrical traction offers considerable difficulty in the opinion of the *Engineer*. Many of these difficulties come in with the numerous junctions of other railways, as the Great Western, Midland, Great Northern, which, running upon the Metropolitan, make it an open question whether—at least at first—there should not be both steam and electrical working. This in itself does not seem very terrible. With only half the trains worked by steam, there would be considerable improvement in the atmosphere. The directors of the line are, of course, greatly pleased with the antiseptic nature of their tunnel atmosphere. We prefer it ourselves to the unchanged foulness of the unventilated buried electrical railway. While the electrical lines are bound to keep their tunnels little worse than the outside atmosphere, we would tell the Metropolitan directors that they are not bound to maintain their shallow tunnels in better condition than the atmosphere. The philanthropic provision of an antiseptic atmosphere is doubtless kindly meant, but the public are willing to forego the boon. Our contemporary calls on the Metropolitan Company to provide lifts at the stations, facilities for some amount of personal luggage, clean stations, and generally such comforts as would remove the line from the stage of barbarism from which it never seems able to emerge. We think if the Metropolitan Company really set itself to the task of electrical working that the difficulties anticipated would disappear as they came to be grappled with. That it would involve an enormous capital expenditure to put in electrical equipment is undoubted, but we have previously shown that a comparatively small addition to traffic would find an income to pay interest on such outlay, and there can be no doubt that if properly managed the dirty underground might become a clean and paying undertaking. As our contemporary implies, the line has been so brutally managed in the way of dirt and roughing it, that the "system has never had a fair chance yet," and while electricity would be valuable, it is doubtful wisdom to introduce it except in company with other much needed improvements. American experience in electric traction is sufficient to show us that the mere factor of working expenses is not of much moment. Grant that the train mile cost is increased, this can matter little, so long as the receipts more than proportionately grow. It is to this end that electric traction will tend.

MANAGEMENT OF ELECTRICAL UNDERTAKINGS.

The paper on the above subject by Councillor Hesford, read before the Municipal Electrical Association, is not remarkable for its originality. He begins by stating that electrical undertakings can be efficiently administered and profitably managed by local authorities, but he omits to say that such undertakings can be, and sometimes are, inefficiently administered and badly and unprofitably managed by local authorities, particularly when the gas interests of the authorities are interfered with, when individual members of Committees have their own irons to warm, or when political parties fight their battles without regard to anything but the final supremacy of their particular party. After referring to the well-known apathy of local authorities respecting electric lighting, the author proceeds to enumerate the difficulties to be met by those Corporations who decide to take up the electric lighting business.

We are glad to learn from Councillor Hesford that "Every Committee know what they want," and according to him, "It is a station and system of distribution that shall be second to none. It must be planned for utility and convenience, and meet the unknown wants of futurity. Its machinery should be designed to adapt itself with precision and success to all the varying requirements; work at a cost that shall top the record and be obtained from the lowest tenderer. These are the ideals, and the question is how to get them." Exactly; and the writer does not go very far towards trying to perform the obviously impossible task of explaining how it may be done, but contents himself with dwelling upon the idiosyncrasies of the consulting engineer, and the troubles of the Committee, who find that everything is wrong in their station after it has been running for a time. Bad design, buildings too narrow or too short, day plant too small, are amongst the discoveries made, and a scrap heap becomes necessary. Start a reserve fund, says Councillor Hesford, in order to provide for these contingencies. Very good advice, but not original, as we fancy the Local Government Board will sooner or later point out to those Corporations who omit such an obvious precaution.

The author is of opinion that "the primary and foremost duty" of a Committee is to break the record of low costs, and plainly states that the comparative cost-tables published by a contemporary show up the failings of undertakings. Here we must disagree with the worthy Councillor, for however valuable such comparative tables may be, a low works' cost does not of necessity mean good design or management, nor does a high cost mean bad management or design, and before any fair comparison can be made, a deal of further information would be required.

A station in which the staff are paid fair and proper salaries and wages cannot compete in the question of costs with another station worked largely by premium pupils. To endeavour to work a station economically is laudable and an obvious duty, but the attempts of some committees to cut down salaries and wages and to generally starve their works is little short of a scandal, to which we fear the electrical engineer is sometimes a party. The writer complains of the cost of distribution, and looks forward to the time when its reduction will bring the light within reach of the poor man, but we are afraid the poor man will have to wait a long time if cheap light necessitates much cheaper distribution. He considers that street lighting by electricity must wait until the cost is materially reduced, "as corporate gas committees are tough, thick-skinned gentlemen." We are afraid we are uncomplimentary enough to consider them thick-headed also; surely one way of reducing the cost would be to go in for it on a big scale. But do they desire it at any price?

A few remarks on charging, in which he suggests that the lowest price per unit should be aimed at consistent with covering all charges, and a general lamentation that the breakdown of steam plant prophesied does not occur, while faults on mains not foreshadowed are frequent, brings the paper to a close. Councillor Hesford's advice is—Start a reserve fund, break the record for low costs—anyhow—but break the record, and reduce the cost of distribution.

Apparently good management does not include the giving of an efficient supply, as this is not mentioned.

SWITCHBOARD APPARATUS.

Mr. J. R. Blaikie's M.E.A. paper under this heading, is of the type to excite discussion, and switch-gear has not yet reached the stage when engineers feel that there is little more to be done than maintain what is in use. Low tension supply may be fairly secure on this point, as only in individual stations is the switchboard unsatisfactory, but one cannot believe that the largely varying types, forms and sizes, are necessary or desirable. For complication, it is admitted that three-wire boards easily beat those employed in alternating distribution, and this is to be expected. The use of batteries, motor-boosters, and such like auxiliary apparatus, complicate the switch-gear without making it unmanageable.

Mr. Blaikie, however, principally deals with alternating boards, as might be anticipated. It is with this class that the greatest divergency of detail and arrangement is to be found. Frequently the combination is unnecessarily intricate, but we would not care to go as far as the author in attributing it to ignorance or vanity. After all, what is wanted is a reliable and well-designed set of details, switches, fuses, and regulators, and the board as a combination of these should be the result of the responsible engineer's requirements, and adapted to suit the local conditions. This seems to be rather overlooked in the paper, for, take a modern station, arc lighting is gradually extending, and we have separate plant, rectifiers, parallel alternating arcs, and series alternating arcs. Each of these will require an appropriate board, and sometimes more than one of these methods is at work in an alternating station. Auxiliary batteries, feeders, boosters, synchronising gear, dead-load, traction supply, and exciting arrangements, may all have to be provided for, and it would be rash to urge uniformity throughout the business. Nevertheless the fact is that the details are still lamentably weak, and engineers too frequently design or call for a tender for a "switchboard," when what should be asked for is a combination to their own ideas of switches, fuses, instruments, &c. It is upon these lines that American manufacturers have been working for years with success, although their designs do not fulfil English requirements generally, owing to the wide divergence in generation and distribution practice in this country and on the other side of the Atlantic.

Taking the details, everyone will allow that the plug switch has done, and continues to do, good work for currents up to 80 or 100 amperes, so long as double-pole breaking is required. We are rapidly passing to something beyond this, and the difficulty then arises: What switch is thoroughly satisfactory for currents of 150 to 300 amperes at 2,000 volts alternating? This question is not answered in the paper, nor does it seem easy to give a reply. Large numbers of the Ferranti lever pattern are coming into use; but this is a "switchboard," and will not harmonise with any other arrangement. The choice therefore remains with one or two makers, whose apparatus has not yet been in use long enough to make it prudent to speak too definitely upon its merits. Then comes the disputed point—are fuses desirable in the alternator circuits? We think not, and the reasons are ably and clearly expressed in Mr. Andrews's recent Institution Electrical Engineers' paper. A *good* non-return device does everything that is wanted, but it must be of a universal pattern, and generally adaptable. Circuits must have switches and fuses, but there should be no great difficulty in selecting them, because the currents are not generally large, and the switches need not be operated at full load. It is too often forgotten, and is not mentioned in the paper, that alternator switches and fuses may have to break many times the normal current at considerably over the generated pressure. Thus, if one machine is taken off the bus bars when just motoring the pressure across the break of the switch or fuse may be something approaching the sum of the bus bar and machine pressures, due to the change in speed of the machine throwing the phases into opposite sign. For similar reasoning, we think Mr. Blaikie's table of breaking distances of little use, and likely to lead to trouble if adopted, for a switch or fuse of *n* ampere carrying capacity (or rated value) may have to break a current of many times *n* amperes, should the circuit it controls develop a short circuit, or the machine in whose connection it is break down and the current come back from the bus bars. In fine, a switch or fuse *must* be capable of dealing with the abnormal conditions due to a fault so far as breaking goes, although it may only be called upon to *carry* its rated current without heating. Again, with continuous currents the inductance effect may be considerable, and this is usually allowed for, but too often it is ignored that capacity on an alternating system may be quite as vicious in its tendency to carry over, to say nothing of the unavoidable risk of opening the circuit at the instant when the peak of the pressure curve is reached.

Oil-pot and protected fuses—such as the Ferranti, Cowan-Still, and Bates patterns—have proved themselves to be thoroughly reliable in careful hands, and are on the whole better designed than most switches. It is a very curious fact that the automatic cut-outs used on continuous current boards should have given so much trouble; one would have thought their design such a simple matter that no fault would be found with them. Yet they have an unhappy knack of flying "off" when a rush of current takes place—a thing that ought only to hold them on more securely. We venture to hazard the suggestion that lamination of the cores and pole-pieces will cure this evil propensity.

With the latter part of the paper there is little need to deal. Everyone will agree with the strictures passed upon ammeters which don't read current, and voltmeters whose behaviour is erratic to the last degree. The instrument maker, unfettered as regards price, and not limited by "minimum loss of power" clauses, can do fairly well in the matter of instruments, and no one, whose laboratory training has included a course of research work or absolute measurements, need be in a difficulty regarding pressure or current, for the behaviour of instruments reflects the treatment to which they are subjected. In like manner, regulating, and other subsidiary switches, if thoroughly mechanical, give no trouble, but in these days of expensive labour, good fitting, and finish is not ensured by accepting the lowest tender.

One or two points still await ample discussion; foremost amongst these is the best means of providing interchangeability of circuits and machines, commonly known as "hospital barring" or "jack-carding." Within this subject falls "boosting," or individual regulation of high tension feeders. No longer can it be said that the sweet simplicity of the alternating system from pressure-raising devices on feeders is its strong recommendation; either feeder boosters or separate busses at different pressures have to be installed, but no one seems quite settled in his own mind what should be done, or to be able to agree with his neighbour what manufacturers should be called upon to turn out for the purpose.

In closing this review of a useful paper, we would like to strongly urge the claims of all switchboards to be treated in the same manner as other parts of the plant. Frequent inspection, cleaning, trivial adjustments, and small repairs are as necessary as anywhere else, and there is no reserve of x per cent. on the board. Either each detail works, or it does not; yet how often is the board neglected, while boilers, engines, and generators are kept up to the very pink of perfection.

SINGLE v. MULTIPLE GENERATING STATIONS.

The paper on the above subject, prepared by Mr. Snell for the meeting of the Municipal Electrical Association, and reprinted in this issue, is intended, as we learn from the author, merely to serve as a basis for thrashing out the arguments for and against supplying any district with current from one or from several generating stations. The question upon which discussion is invited is one of considerable importance, in view of the steady growth of the supply business, and it is one which the engineers of several of the larger towns have already been called on to decide, and which will, in the near future, have to be examined in connection with the extensions which are in progress in many districts.

The author is in favour of multiple stations, and deals with his subject under the various headings of capital cost, economic generation and distribution, load factor, and possible creation of nuisance.

With regard to what Mr. Snell calls the critical limit of horse-power installed, the opinion of Dr. Kennedy is quoted, that, when one has reached an aggregate power of between 3,000 and 5,000 horse-power, it is as cheap to build a second station as to go on increasing the capacity of the existing one. This statement was made by Dr. Kennedy at a time when the largest generating units in use were, we believe, generally of 300 to 400 horse-power, and it would be interesting to know to what extent this limit would be increased now that much larger units are being used, as, for instance, at Manchester, Deptford, and Bankside, where units of as much as 2,500 H.P. have been adopted. The exact fixing of this limit is, however, not a matter of prime importance, as we believe that in many towns the question of single or multiple stations will have to be answered before even the lower limit of 3,000 H.P. is reached, as a large number of stations are in existence where it would be difficult to erect anything like this capacity of plant, and where, owing to the surroundings of the site, it would not be possible to sufficiently extend the station buildings without going to very great expense in the purchase of neighbouring property.

The question then arises as to whether it is preferable to commence operations on a new site on a much larger scale, and eventually do away with the original small generating station, or whether this first station should be maintained, and a second one erected and worked in conjunction with it. The answer to such a question depends so much on local conditions, such as the relative positions of the old station, of the possible sites for a new one, and of what we may call the centre of gravity of the demand, that we do not see how it can be settled otherwise than by examining each separate case on its merits. In this connection we would draw attention to the assumption made by Mr. Snell throughout his paper, that the one large station will be extra-mural, and the several smaller ones intra-mural. We do not think that this assumption is justifiable, as, in our opinion, the advantages of the multiple station system may often be greatest when these stations are extra-mural, or near the boundary of the town; as in such a case it will frequently be possible to get all, or almost all, the advantages which can be claimed for a single large extra-mural station, and yet be able to supply current on a direct system without undue expenditure on mains; because, if the stations are placed on opposite sides of the town, it is possible to halve the length of the feeders, which only have to come from one side to the centre, instead of having to traverse the town from one side to the other.

The same conditions hold good when we consider the question from the point of view of economy in generation and distribution, as if the station or stations are in the central parts of the town, or, to use Mr. Snell's words, are erected on the mains they are to supply, so that the distribution losses are small, there will almost certainly be compensating disadvantages in the extra cost of carting coal and ashes, in getting condensing water, and in the increased chances of trouble from the nuisance question. On the other hand, if the station or stations are out of the town or near its boundaries, it will often be possible to find two sites which will permit of moderate distribution losses, whilst at the same time offering facilities for dealing with coal and ashes and for condensing. Of course, there will be cases when one large station will give the best results; but on this point it is, as we have already said, difficult to generalise, and our remarks are made rather to draw attention to the fact that even when several stations are used to serve a town, it may be better to erect them practically outside the boundaries, rather than on the mains they are to supply.

We cannot quite understand Mr. Snell's remarks about the load factor, and do not see how he can expect a better one with several stations than with one. If the term load factor is used in the ordinary sense of the ratio of the actual average output per hour to the maximum output of any hour during the year, it will not be changed whether there be one or more stations; and if the factor referred to be a plant factor, we should expect the advantage, if there be any, to be on the side of the single station.

With regard to the nuisance question, a station situated centrally is always at a disadvantage, and we do not agree with the author of the paper that vibration and smoke nuisance can so easily be dealt with in a satisfactory manner. It is wonderful how keenly sensitive to vibrations the neighbours of a central station become, if they think there is the slightest chance of getting anything out of a supply company; and with regard to the smoke nuisance, we have for some time past had convincing evidence in London that Mr. Snell is somewhat optimistic when he says: "One may confidently say that in these days there are few of us who would care to admit that our stations would be complained of from this point, and with careful stoking and management, the smoke nuisance is more visionary than real."

The question of how best to extend, so as to be able to supply current in greater quantities, and over a larger area, is one which gives plenty of scope for discussion, and we hope that some of the municipal engineers who have lately carried out such extensions, or have reported on the best way of doing so, will communicate to the meeting their reasons for adopting the methods they have recommended; as, notwithstanding the local differences which must exist between one district and another, all such information must be of great use to their fellow engineers who may have to consider this question.

Presentation.—Mr. F. T. Paynter, shift engineer at the Windsor electrical installation works, has been presented with a marble timepiece and a pair of ormolu ornaments by the directors and staff on the occasion of his marriage.

REVIEWS.

A Text-Book of Applied Mechanics. Vol. II. By ANDREW JAMIESON. London: Griffin & Co. 1897.

This is one of a growing family of books whose origin is based on the idea religiously held by every engineering professor, that he must protect the morals of his own flock by specially preparing a text-book for their use. Anyone who has had the misfortune to pay school bills knows how the pedagogues at one school play into the hands of those of other schools, by discovering virtues in new grammars. Curious, is it not, that a dead language like Latin is so much alive that new grammars can be poured forth about it, whereas there is no grammar at all of Anglo-Saxon slang, so very much alive? Some such thoughts as these attack one on the appearance of a new book of mechanics. We have paid for so many improved grammars and English histories, that we feel sorry for those who have got to buy all the mechanical text-books. But having said this, we don't propose to say much more against Prof. Jamieson's book. We can forgive a good deal to a man who, being a professor, resolutely refuses to use the word poundal in his pages. We have searched diligently, and lo! we have not found it.

We would also desire to compliment the author on the choice and method of the examples he has employed, notably where he shows how the tension in a rope is so much greater than the weight it is lifting when acceleration is in progress. We incline to think that rope tensions are often treated entirely from a static standpoint, with perhaps liberal margins, a very undesirable thing to do in face of the rapid accelerations in deep pit work and high buildings' elevators.

The first part of the book concludes with a description of many varieties of engine governors and other examples of centrifugal force and machine balancing. Part IV. deals first with the graphic statics of framed structures, and is about as clear an exposition of this art as we have seen. Part V. deals with the stresses in shafts and beams and their deflections, and Part VI. with hydraulics and hydraulic machinery and refrigerating machines, which seem to be a little out of place and more suitable for special treatises.

Altogether, however, this is a very common-sense sort of book. It is intended for students advanced beyond the elementary stage who may or ought to be supposed to know that, strictly speaking, the term *cold* is intended to convey the idea of more or less deprivation of heat. Cold is simply a relative form of heat, and were we a professor with an abnormally developed sense of the supreme importance of definition we should *lodge* a complaint against our author for some of his language. On page 360, speaking of refrigerating machinery, he has the temerity to speak of brine as acting as a transmitter of cold. Of course, everyone will perfectly understand what is meant, and we think no one will even be led astray, but there be many will have his blood for speaking of cold as an entity. Our complaint of the account of refrigeration is that it is a mere description, there are no figures or dimensions to enable a student to make a calculation of what can be done with a machine, nothing as to the physical properties of the materials employed in refrigeration and what can be accomplished with them. We do not see why this mere descriptive section has been added to the book.

Electric Wiring and Fittings Details Book. By W. PERREN MAYCOCK. London: Whittaker & Co.

This book is intended for firms connected with the electric wiring business, its object being to afford an expeditious, convenient, and methodical means for noting down particulars concerning both the wiring and fittings of any electrical installation, on any wiring system. It consists of little more than a mass of sheets set out with columns, for the purpose of taking proper note of the required positions of lights and other fittings, the description of fittings to be put up, and general remarks regarding same. We observe the sheets are perforated for tearing out; this is perhaps as well, for the book is rather bulky. The idea of the author is a good one, and the book may be of service to some engineers and wiring contractors. There are two pages of directions for use, so that the user may understand what he is about.

THE MUNICIPAL ELECTRICAL ASSOCIATION.

THE third annual Convention was opened on Wednesday morning at the Royal United Service Institution. The programme, which we published in our issue of May 27th, showed that the public proceedings were to last three days. Of the importance of the papers to be presented there can scarcely be a diversity of opinion. The range of subjects is probably not so wide, and they are probably more specialised in their treatment than was the case at the last Convention in London. They mainly deal with the essential features of municipal electricity supply from the engineering point of view, and were naturally expected to evoke considerable discussion.

A large number of municipal engineers and a moderate sprinkling of other members of the electrical engineering profession were present when Mr. A. H. Gibbings, the President, rose to deliver his Presidential Address. It is scarcely necessary here to dwell in detail upon the points raised by the President. He referred with some amount of pride to the educational and the stimulating effect that their former conventions had created, and he considered that the rapid progress that had been made by municipalities in electrical undertakings during the past two years was due, in a great measure, to the work of the Municipal Electrical Association. He dwelt at some length upon the constitution of electricity committees, and suggested a divided responsibility, by forming electricity sub-committees. The future developments of electricity supply were noted, and the address concluded by some suggestive remarks on the subject of standardisation of plant. He pointed out that while many were agreed that some form of standardising was necessary, there was a diversity of opinion as to what the respective standards should be. The co-operation with other and kindred societies for the purpose of dealing with some of the special subjects he had raised was insisted upon with some force.

The next business of the meeting was to hear a paper read by Mr. Councillor Hesford, chairman of the Electricity Committee of the Southport Committee, on "The Management of Electrical Undertakings." The paper is published in full in another part of this issue, and it is not proposed to do more than give the principal points raised in the discussion. Mr. Faraday Proctor (Bristol) raised some interesting points, the chief of which were, that it was always advisable to engage an engineer, who was to run a station, from the the commencement of building operations. In the case of a small station, he thought it best to employ a consulting engineer, because it would not be possible to pay an adequate salary to a resident engineer who was capable of laying down plant; at the same time he urged that a resident engineer should be there all the time. The question of dividing the engineering and secretarial work was next brought forward. Mr. Proctor's view seems to be that the mere account work should be done by a separate department, but that the secretarial work should be done by the engineer. Mr. Councillor Skinner, of Hull, referred to the practice relating to accounts in that town, and said they all passed through the hands of the treasurer. Mr. Bromley Holmes (Liverpool) thought the engineer's duties should cease when the units were certified in the consumers' books. Mr. Jackson (Newcastle) asked if it would not be possible to get municipalities to make their accounts more in accord with the Board of Trade form, so that it would be possible to compare the accounts with those of companies. He referred to the practice in some Continental stations of employing a mechanical engineer, an electrical engineer, and an outside engineer. Generally speaking, the outside man in this country was not paid well enough. Mr. Wordingham (Manchester) thought that the paper dealt with the policy rather than the management of stations. His views on the employment of a consulting engineer were almost similar to those of Mr. Proctor. In his opinion it was unnecessary to duplicate generating plant; it would be difficult to duplicate distributing network, but feeders could more easily be duplicated. He considered that the accountant's portion of an undertaking should be entirely separate from the engineering part. The engineer should have a voice in the financial management, but actual account work should be entirely separate. Mr. Boot (Tunbridge Wells) raised an interesting point about the reserve fund, and Mr. Robert Hammond having addressed the meeting, mainly on the reserve fund question, Mr. Hesford briefly replied.

The meeting then proceeded to discuss Mr. Blaikie's paper on "Switchboard Apparatus," the paper being taken as read. Mr. Wordingham thought there ought to be no inflammable material in connection with a switchboard, and did not admit the difficulty of making it decent looking under such circumstances. It was impossible to lay down any definite length of break in a switch according to current, because a good deal depended on the design of the switch, and the speed of the break. Fuses were necessary in high pressure stations, but in low pressure works they did more harm than good. He thought there was room for some convenient and cheap means of signalling between the switchboard and the engines. Mr. Andrews (Hastings) after referring to automatic cut-outs, and pointing out that electrical engineers did not like them, because they were unreliable, said that a fuse on an alternator was useless, and a great source of danger. Mr. Robert Hammond expressed his surprise that wooden switchboards abounded in Germany. He pointed out that it was important not to put an inflammable board on a flammable floor, and he advocated a space of at least 4 feet between the back of the board and the wall. Mr. Rider (Plymouth) spoke of the danger of the field switch being on the dynamo instead of on the board. With regard to the space at the back of the switchboard, he thought the best arrangement was to have no back at all. Mr. Quin (Blackpool) and Mr. Evershed made some remarks, and the meeting passed on to rapidly discuss Mr. Jeckell's paper.

CORRESPONDENCE.

Prof. Carus-Wilson's Paper.

As it would appear, judging from to-day's issue of a contemporary, that I did not make my meaning plain—even to the author of the paper—at the discussion on Prof. Carus-Wilson's paper on the 26th ult., I beg leave to supplement it by a few remarks, which will, I hope, explain more clearly my reasons for disagreeing from Prof. Carus-Wilson's figure No. 5.

I may say at the outset that I quite understood that Prof. Carus-Wilson's remarks related only to the shunt motor, but in view of the diagrams in fig. 4 and the conclusions deduced on page 8, the inference may have been drawn by some that the error was equally negligible with the series motor; and the curves in fig. 5, which show the series motor covering the distance in *less* time than the shunt motor, may strengthen this wrong impression.

It only needs pointing out for it to be seen that fig. 5 is not a practical case; for, if we have a locomotive to draw our train, we cut down its weight to nothing more than that necessary for the requisite power; while, if we have motors on the bogies, we cut down their number to the minimum consistent with the necessary power and space available, *i.e.*, if we at all value our peace of mind. In either case the limiting value of the initial acceleration is determined solely by *adhesion*; and in comparing the shunt and series motors Prof. Carus-Wilson has departed from this assumption.

Imagine the initial slope of the series curve (fig. 5) made the same as that of the shunt curve, so that the series curve falls away from the straight line, *o a*, on reaching a speed of about 10 feet per second, and it will be evident that the current for the series motor would be required much longer at its maximum value, and much longer at its final value, than shown; also that the time required to cover the 500 feet would then be much greater for the series than for the shunt motor.

Imagine, further, that the level part of the shunt curve (representing constant acceleration) was lowered, so that the distance was covered in each case in the *same* time, and I think we shall find there is not much difference between the energy required in the two cases.

The example I cited from Mr. Short, as well as that which had occurred in my own work, and my deductions therefrom, were based on an equal initial acceleration in the two curves compared. In the latter case both curves were for the same final speed and, in departing from this, Mr. Short has, I venture to think, rather given his case away so far as energy consumption is concerned.

My remarks were intended to show—not that Mr. Short's apparatus for effecting it was perfect—but that the principle of carrying the acceleration at its full value right up to the point when the maximum speed of the train is reached, is a good one, and this, I venture to think, has yet to be disproved.

Prof. Carus-Wilson's own conclusions and his curves in fig. 4 are, in fact, based on this assumption, though he does not explain how he proposes to obtain it with a series motor.

Hoping I have made this clear, and that you will be able to find space to insert this letter.

A. M. Taylor.

Electricity (?) direct from Water Power.

If Herr Josef Popper has had the notion referred to in your note on page 731 of your issue of May 27th, on his mind since 1895; it must have been a heavy burden to it. A normally vigorous one would have tossed it off long ago. Why, in all that time, hasn't he put the idea to a practical test? Or, stranger still, why, at least, hasn't he put it through the mathematical grinding mill—the mill that grinds bright ideas so exceeding small—and, as others have before him, seen it puff away in thin air? *That* wouldn't require three long years of patient meditation; in fact, it is a more simple process than putting pen to paper to describe the grand idea.

The same brilliant inspiration visited the writer some years previous to 1895 in much the same way no doubt as it has lighted round on many others before and since. But sad to relate, it did not behave so congenially to him as it has to Herr Popper. In fact, after the first joyful welcome of what appeared so charming a guest; want of confidence in his credentials, or his claims to be all he seemed, grew up with such alarming rapidity, that a few short hours terminated the intercourse.

He is fortunate, at last, to have found such a staunch friend as Herr Popper, for really, his character, so fair-seeming at first acquaintance, has such an uncomfortable habit of falling to pieces upon closer investigation, that his friendships, if many, are all too brief. Clearly Herr Popper must be one of those delightful but erratic souls, who, hospitable to a fault, would scorn to harbour a suspicion of an agreeable guest.

The crux of the difficulty in realising the promise of this idea, lies in the implacable fact that 100 million magnetic lines of force must be cut through per second by a conductor to generate at its ends a potential difference of 1 volt. We come against the same old boundary fence that limits our aspirations in so many other ways. For the greatest practical value of the magnetic induction attainable falls short of 20,000 lines per sq. cms. Therefore, to generate 1 volt per centimetre length of conductor, the velocity of the conductor across the magnetic field of such strength must be 5,000 cms. per second, equivalent to about 170 feet per second. To obtain this velocity, in a jet of water for instance, would require a head of over 400 feet.

The transverse resistance of a jet of water 1 centimetre through depends mostly upon the area of the contacts. It is very considerable at the best; and there is only 1 volt pressure available both for this and the external circuit. Current is likely to be a wanting quantity under these circumstances. Suppose we increase the velocity, and leap with vaunting ambition to, say, 1,000 feet per second, needing a water head of 15,000 feet, or pressure of over 3 tons per square inch, and therefore quite outside the bounds of practice. It gives us a meagre 6 volts for a centimetre jet, which, by the way, would be passing an enormous quantity of water, and could scarcely be constructed to stand the wear and tear.

There is no question of multiplying the jets and placing them in series, for the internal resistance increases them in the same proportion as the volts. Further, there are practical difficulties in the way of insulating the jets which are insurmountable. It would be a sufficiently onerous business to insulate one jet; in which there would in any case be considerable leakage up and down the stream, and thence across it outside the influence of the magnetic field. To insulate many jets, many pipes, many reservoirs, many mountain lakes and river sources—well, no thanks! the idea is a little too appalling!

All the above applies with even greater force to the proposal to use gases. At most 20 volts might be obtained across a jet 1 centimetre through, and a resistance inexpressible in megohms! May our quondam guest have a long and contented residence in Germany!

James Whitcher.

Nottingham, *June 3rd.*

Honour to whom Honour is Due.

I have read with interest your article "Honour to whom Honour is Due," at p. 685 of your esteemed journal. I may be allowed to add in connection with this subject that Prof. Holtz has proved up to the hilt at p. 686 (A.D. 1883) of my "Centralblatt für Elektrotechnik" that he invented at a much earlier date the machine now ascribed to Mr. James Wimshurst. If the Council of the Royal Society propose to distinguish Mr. Wimshurst on account of his machine, the ignorance of the history of science displayed by that eminent body is to be deplored.

Uppenborn.

May 31st, 1898.

[Mr. Rollo Appleyard in his letter in the ELECTRICAL REVIEW. May 27th, considers that we have been scarcely fair to James Wimshurst in our article dealing with the question of priority of invention of the Wimshurst influence machine. The above letter shows that we are at least in agreement with so high an authority on the history of electricity as Uppenborn. We may also quote from Prof. Schaffers, of Louvain, in his recently-published work, "Essai sur la theorie des Machines Electriques a Influence," where he says, "De fait, en 1876, Holtz avait clairement decrit le dispositif particulier aux machines Wimshurst secteurs radiaux et conducteurs à balais." Speaking of the machine illustrated in our figure, p. 685, Holtz said in 1876 (*Nachrichten von der kön Ges. der Wissenschaft Göttingen*) that the before-mentioned machine may be made self-exciting by covering the plates with small radial strips of tinfoil and replacing the combs with brushes or springs. Mr. Rollo Appleyard in his letter carefully avoids pointing out in what respect the Wimshurst machine differs from the machine invented long before by Holtz. The evidence we have cited appears to show that there is no difference in any essential electrical detail. No one thoroughly acquainted with the subject will venture to say that machines of Varley, Tœpler, or Kelvin come into the same category. It is useless for Mr. Appleyard to say the machine of Holtz did not possess the five "simultaneous characteristics" of the Wimshurst machine. The machines, being identical, must both possess five or any greater number of "simultaneous characteristics." Mr. Wimshurst deserves the credit of having introduced to physicists in this country a very valuable electrical machine, which otherwise would probably have long lain buried in obscure German publications. It is his misfortune that, without his knowledge, he had been anticipated, but such misfortunes are not usually considered a justification for depriving the first inventor of the credit which is his due.—EDS. ELEC. REV.]

The Chelmsford Fatality.

Another victim to the use of high tension alternating currents!

Everyone connected with the electric light industry must be sincerely sorry at the sad calamity.

As a rule, sooner or later, fatal accidents occur at most stations where such a dangerous system to employés is in use.

Recognising the dangers connected with it, you would naturally expect that in planning and arranging for the safety of the workmen, some common-sense means would be adopted to prevent the possibility of fatal accidents.

What are the actual facts? Instead of placing transformers in a special building, with plenty of room and ample daylight—which are an absolute necessity—they are generally fixed under the pavement in limited space, and to get to them the workmen have to grope their way down iron ladders or iron projections to a dark chamber.

I consider erecting small dark sub-transformer stations under the public pavements leads to accidents, and should be discontinued.

If not, as time goes on, more shocking fatalities will occur, with the usual verdict of accidental death to follow.

I know, from practical experiments made over 14 years ago, during wet weather, and while wearing wet boots, how quickly you can get shocks, but I naturally took care that the experiments I made were with continuous currents of about 400 volts pressure.

A transforming sub-station should not be built without having easy access to it, plenty of daylight, a good dry wood floor, and over it vulcanised rubber sheets of substantial thickness.

I recollect a few years ago explosions in electric light conduits were rather frequent in London, and I noticed about that time you had a short article in the ELECTRICAL REVIEW referring to them, and asked if anyone, from their experience, could suggest a cure. On that invitation I related my early experiences, and suggested (having laid the first underground mains for electric light under the London streets) that in the absence of good ventilation in the conduits of the companies affected, if they would remove the lids of the service connections every morning, the explosions would cease.

The hint I saw was very quickly acted on, and the explosions—well, you never hear of them now.

I hope my suggestions *re* transformer sub-stations will also be acted upon. If so, I am quite certain it will, in the future, be one of the means of assisting to stop the cause of recent fatal electric shocks, where high tension alternating currents are used.

A. L. Fyfe.

The Parliamentary Committee on Electricity Supply.

In the revised report of the Joint Committee on Electrical Energy (Generating Stations and Supply) just issued there appears two clauses which were not in the proof which was handed out just before Whitsuntide, but which are of such great importance that I venture to ask you to call attention to the fact in your next issue.

The clauses to which I refer are as follows:—"In connection with this question of purchase under section 2 of the Act of 1888, evidence has been given to the effect that with a view to secure in London one and the same time for execution of the powers, the Board of Trade have in some cases imposed upon undertakers a less term than 42 years within which they are liable to be purchased."

"The Committee suggest that if the full period of 42 years is not granted, and if a substantially shorter period is imposed by the Board of Trade, the terms of purchase should in each case be reconsidered."

Syd. Morse.

The Electrical Engineers Volunteers.

A friend of mine on hearing that the uniform of the Electrical Engineers Volunteers was to be the same as that of the volunteer battalions of the Royal Engineers, at once gave up all idea of joining the corps, although he was very keen on being a member when he first heard that such a regiment was to be enrolled. He is now making arrangements to join the Yeomanry Cavalry, as, to use his own words, he "will then be able to walk through the public streets in uniform without being insulted and his friends will not be ashamed to speak to him."

Whether his views are right or no, there is no doubt that the great majority of the British public always associate the red coat with that useful but much maligned body of men, viz., the Militia, and I have known many young fellows join the Artillery, although the work is harder than that of a rifle corps, for the simple reason that the latter have such a prominent uniform.

Thinking that probably my friend's case is not a solitary one, I would beg to suggest to the proper authorities that an alteration might be made to the uniform, and as no doubt it is now too late to do away with the red tunic, might not the facings be such as to be entirely different from any other regiment.

There is no doubt that the Electrical Engineers will be one of the crack corps of our volunteer army; the men no doubt mean to be, and the profession expects them to be, and such being the case the War Office might give them a uniform that would proclaim to all and sundry the regiment to which they are proud to belong.

Bankruptcy Proceedings.—On 3rd inst., at the offices of Mr. J. C. Clegg, Official Receiver, a meeting was held of the creditors of John Henry Dewhurst and George Longden, who traded as John Dewhurst & Son, electrical engineers, 68, 70, and 72, Attercliffe Road, Sheffield. Mr. J. E. Wing represented the debtors. The Official Receiver stated that the receiving order was made on May 12th on a creditor's petition. The statement of affairs showed £1,938 2s. 10d. owing to unsecured creditors, and £205 10s. 11d. liabilities on accommodation bills, making the total liabilities £2,143 13s. 9d. The only assets were some doubtful and bad debts which were estimated at £100. Some time prior to October last the debtors carried on business in Attercliffe Road as partners, though originally neither of them took any capital into the concern. In October the business was converted into a limited company, an agreement being made between the parties that the company were to take to the business and to pay £5,000—£4,000 in shares, and £1,000 in cash on October 4th, 1902. The company were to be entitled to possession as from October 1st, and in accordance with the agreement the concern was transferred to them a few days later. The shares had not been issued to the vendors, and he believed there had been some subsidiary agreement in relation to the £1,000 under which certain payments had been made, or were alleged to have been made on behalf of the vendors to enable them to meet some of their outstanding liabilities. He did not thoroughly understand this matter yet, and could not get a proper explanation from the debtors. The agreement provided that the liabilities of the vendors should be paid by the company, but certain of the liabilities in respect of money-lending transactions were not taken over by the company. The matter would, of course, require further looking into. Perhaps there might not be any great advantage in following it up, because he understood that there had been no further capital brought into the company except a sum of £1,000, part of which was applied in payment of the expenses of the formation of the company. One thing was pretty clear that by the agreement the debtors transferred all their assets to the company, and left themselves with outstanding liabilities to the amount of something like £2,000, and no means of meeting these debts. That was the position they were left in under the agreement, and, of course, the debtors soon began to realise the difficulty of their position. After struggling on for some time they executed a deed of arrangement, but one of the creditors who did not consent to the arrangement presented a petition, and the receiving order was made. As far as the separate estates of the debtors were concerned the only asset in each case was household furniture. It was clear that the debtors were largely insolvent in October last. They said they were not aware of this, but subsequent investigation proved such to be the fact. Mr. Wing said with regard to the £1,000 cash, the debtors were owing the Birmingham District and Counties Bank about £2,500 when the company was formed, and they also owed money to moneylenders. It was arranged that the £1,000 should be advanced by the bank for the purpose of providing means for the bills of the moneylenders to be met—for the purpose of warding them off a bit. When the bank stopped payment the the company was wound up, and the debtors made bankrupt. The company was only in existence about four months, from October to February. The question of the appointment of a trustee was considered, and the estate will be dealt with by the Official Receiver. Mr. Wing explained that he was acting for some of the creditors of the company, and the whole matter would be most thoroughly investigated.

Business Sold.—The business of Kerby Bowen, Limited, electrical launch builders at St. Helen's and Cowes, Isle of Wight, was disposed of by auction on Wednesday last week, by Messrs. Perkins & Sons, by order of the High Court of Justice (Chancery Division), and realised £700.

Campbell v. Benjamin Jacobs.—This action, heard last week at the Glasgow Appeal Court, was for recovery of the contract price for fitting up an installation of electric light. The contract controlled the price so far as workmanship was concerned, but the price of the material was not included, although an estimate was appended to the offer. The defender challenged certain items as excessive. The Sheriff Substitute (Strachan) allowed a proof, and on appeal the Sheriff adhered.

Clayton Air Compressors.—During the months of February, March, and April, the Clayton Air Compressor Works, of New York, sold 19 air compressors for operating pneumatic stone tools, chipping and calking tools, air hoists, &c.; nine air compressors for moving and elevating acid and chemical solutions; four air lift pumping plants were installed and placed in operation; three air compressors were furnished to rubber works for removing hose from mandrels, testing hose and inflating tyres; one compressor was supplied for the pneumatic transmission of messages; two for oil burning plants; three for racking off beer in breweries; one for spraying brick in the process of manufacture; and six for unusual applications of compressed air power. In addition to a number of air compressors furnished for domestic use, four were exported to Europe for operating pneumatic shops plants. The above notes show the wide range of applications of the Clayton compressor.

Dermatine.—A pamphlet giving a short account of the discovery and manufacture of India-rubber and gutta-percha, and a description of the "special characteristics and qualities of dermatine as superior to either," has been issued by the Dermatine Company, Limited, of 95, Neate Street, S.E. Prices and particulars are given of the patent dermatine machine belting, circulating valves, sheet and insertion, mats, and dermatine is recommended as an insulator in electrical work.

Dissolution of Partnership.—Messrs. F. M. Prockter, A. Turner, and H. F. Clough, carrying on business as electrical and general engineers, at 10A, Virginia Street, Southport, under the style of Prockter & Co., have dissolved partnership by mutual consent.

Electric Power for South African Mines.—A South African correspondent of the *Financial News* says that it has been suggested that certain mines which find themselves short of water should avail themselves of the electric power supplied from Brakpan. Thus they would be enabled to close down their steam plant and to do with very little water. The May Consolidated Gold Mining Company is already in negotiation with the Rand Central Electrical Supply Company, and it is likely that arrangements will be shortly made by which the May's mill shall be driven by electric power.

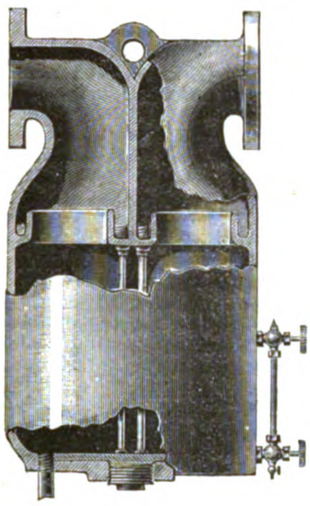
Electric Tramways.—The Brush Electrical Engineering Company has issued two pamphlets reprinting in first class manner descriptions which have appeared in some of the technical papers of the Kidderminster and Stourport electric tramways and the Dover municipal electric tramways. It is well known that both of these are lines for the equipment of which the Brush Company has been mainly or largely responsible.

Exhibitions.—Messrs. W. H. Willcox & Co., are exhibiting a general collection of engineers' tools and engineers' stores, also lubricating oils, at the various agricultural shows which are being held at Portsmouth, Birmingham, and King's Lynn, during this month; and at Lincoln, Leeds, and Tunbridge Wells during July.

Fined.—On Monday at the Wolverhampton (County) Petty Sessions, E. J. Pennington was fined £2 10s. and costs for driving a motor car at a furious rate. Three grooms who gave evidence, respectively stated that the car was proceeding at 20, 25, and 30 miles an hour. The bench commented upon the public danger. On the previous Friday the same defendant was, in another Court, fined £3 and costs for each of various breaches of the Light Locomotives Act (total £18 15s. 8d.) committed on April 23rd.

Forthcoming Book.—Messrs. Seeley & Co. will shortly publish a brief popular account of "Wireless Telegraphy," by Mr. Richard Kerr. The methods devised by Mr. Preece, Signor Marconi, Dr. Oliver Lodge, and others who have worked in this direction will be explained in popular style.

The Hoppes Steam Separators.—The drying of steam by discharging it of water has lately been attracting a good deal of attention. The annexed illustration represents a simple form of separator made by the Hoppes Manufacturing Company, of Springfield, Ohio, which affords a very considerable volume for the collection of water, and will, therefore, provide for a considerable flush of water, and at the same time it provides a cross section about ten times the steam pipe area. Suitable water channels are provided to catch the drip and flow of water down the sides of the vessel and prevent its re-entrainment. A glass gauge shows the amount of accumulation,



and a trap provides for final discharge. It is important that steam traps to separators should be of good size in order to allow the rapid discharge of sudden flushes. The Hoppes separator is symmetrical, and no mistake can be made in fixing it, as steam can enter either side indifferently. Its construction, while sufficient, is simple, and it should give a minimum of obstruction to the flow of steam, an item apt to be overlooked in the construction of separators, on what may be termed the steam worrying system. A somewhat similar apparatus is provided for fixing in vertical lengths of pipe.

Lists.—We have received from Messrs. Parvillee Frères, 29, Rue Gauthey, Paris, an illustrated list of their manufactures of electrical porcelain. The list deals more particularly with insulators for telegraphic, telephonic, and overhead traction work.

Messrs. C. E. Billin & Co., of Marquette Buildings, Chicago, send us a pamphlet (March, 1898) on their machinery and supplies for mines and mills. The firm are engineers, purchasing and forwarding agents, and the list contains special lines of a large number of American manufacturers.

McDonald v. Clement.—At the Glasgow Court of Sessions last week the settlement was intimated of an action by Robert M. M'Donald, electrician, Davos House, Strathtay, against Hugh Sprott Clement, manager of the British Patents Company, 121, West Regent Street, Glasgow. The pursuer sought reduction of a letter written by him to the defender in July, 1893, in which he assigned to the defender one twenty-fourth part of his interest in an invention relating to primary electric batteries. The pursuer said that the letter was written in consideration of the defender having found a purchaser for the patent, but that the defender failed to carry through the sale. The defender raised two actions against the pursuer, in which he sued for payment of the value of his interest. All the actions have now been settled extra judicially.

Newport Electric Light Association.—This association has opened premises at 55, Commercial Road, Newport, as electricians and mechanical engineers. Mr. J. L. Davies, who has had a varied experience in electrical work, is the manager. He was for two years in the employ of the Brush Electric Light Company, and three years at the Edison Central Depôt, New York, U.S.A., and has had three years local experience in wiring and other work.

Parliamentary Bills.—In the House of Commons on Monday, the following Bill received from the Lords was read a second time:—Blackpool and Fleetwood Tramroad (Tramway Extensions). The Great Northern and City Railway Bill was also read a second time. It is stated that the Royal assent has now been given to the Eastern Telegraph Company's Act, 1898, which has been promoted by that company in Parliament for the conversion of the existing 6 per cent. preference shares into 3½ per cent. preference stock, and for other purposes. The final dividend on the 6 per cent. preference shares for the quarter ended June 30th will be paid on or about July 1st next. The dividend on the new 3½ per cent. preference stock will accrue as from July 1st next, and will be paid quarterly on the same dates as those on which the dividend on the 6 per cent. preference shares has hitherto been paid. The existing transfer books are to be closed on June 15th, and the transfer books for the new stock will be opened as from July 1st next.

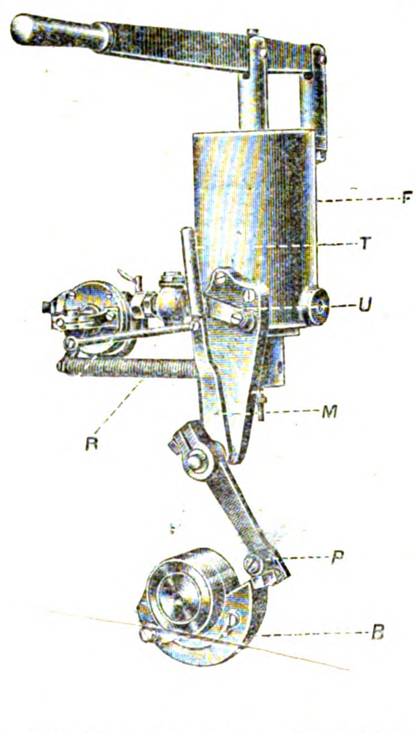
Partnership.—Mr. J. T. Niblett having resigned his position as general manager to the Lithanode Electric Storage Company, announces that he has entered into partnership with Mr. Malcolm Sutherland, and in future the firm will trade under the name of Niblett & Sutherland, electrical engineers, 61, Chandos Street, Strand, W.C.

Personal.—We understand that Mr. H. H. Hall, A.I.E.E., has voluntarily resigned his position as engineer to the Electric Lighting and Fittings Corporation, Limited (late John Haynes Lighting Company, Limited), in order to join the Walsall Electrical Company, Limited, which firm he now represents at 6, Central Chambers, 17a, South Castle Street, Liverpool.

Smoke Nuisance.—On Wednesday last week the London Electric Supply Corporation, Limited, of Stowage Wharf, Deptford, were summoned at Greenwich, at the instance of the Greenwich District Board, for having allowed black smoke to issue from a chimney on two successive days, in such a quantity as to be a nuisance. Mr. J. Spencer, clerk to the Board, prosecuted, and a representative of the Company having pleaded guilty, the magistrate imposed a fine of £10 and 2s. costs in each case.

South African Electrical News.—The *British and South African Export Gazette* has the following items of electrical interest in its June issue:—A shipment of electrical material and machinery, valued at £3,000, has been consigned to Port Elizabeth by a New York firm. The electrical installation supplied to the Angelo and Driefontein mines is a three-phase plant, including engines of 450 H.P., and was manufactured by Messrs. Brown, Boveri & Co., Switzerland. The Town Council of Kingwilliamstown is considering a scheme for the electric lighting of the borough. The Queenstown (Cape Colony) Municipality has also an electric light scheme under consideration. The Durban Town Council has recently ordered two additional miles of cable and a condenser. A telephone installation has been ordered for Bulawayo. The Natal Government estimates for the year ending June, 1899, make provision for additional telephone plant to the extent of £4,900. Electrical lifts for the new premises of Messrs. Thorne, Stuttaford and Co., Johannesburg, are on order with Messrs. R. Waygood and Co., Limited. An electric elevator, manufactured by Messrs. Easton, Anderson & Goolden, has been supplied to the Luipaardsvlei gold mine. The present air compressor pumping plant, which was manufactured by Messrs. J. Cameron for the Langlaagte Deep gold mine, is shortly to be replaced by an electrical pumping installation manufactured by Messrs. Riedler & Co.

Starters for Gas Engines.—In Mr. W. H. Booth's recent article in our columns on "Starters for Gas Engines" he advocated the use of a small starting engine for the purpose. Mr. Joseph



Edmondson, of Bradford, claims to have effected this in another way, namely, by means of the Edmondson & Dawson patent starter. This is claimed to give an initial impulse, automatically proportioned to the requirements of the engine at the time. The advantages claimed for this starter arise from three features, viz.:—(1) The initial impulse being delivered on a piston *already set in motion* (by the compression of the charge by the pump) is cumulative in its effect. In other words, the primary inertia of the piston having already been overcome, the influence of the initial explosion upon it is much greater than it otherwise would be; (2) The initial charge being compressed by the pump, the initial explosion is proportionately more powerful than in any starter working at atmospheric pressure. Owing to these two features, the initial impulse carries the running well over the first cycle, and the piston is moving steadily when it receives the *second* impulse. (3) At the slow speed of starting by any self-starter the proportions of gas and air in the charge drawn into the cylinder is frequently not ignitable by the tube; hence the extreme difficulty of starting an engine by a single initial impulse. In the Edmondson-Dawson starter this difficulty is said to be entirely removed. It injects a flame into the midst of the charge and will therefore ignite a mixture so badly proportioned that the tube would fail to fire. Hence by this starter ignition is certain, and successive impulses are given to the piston—the engine runs in spite of the temporary failure of the tube to fire the charge—and thus the speed is gradually but surely got up to point at which the tube takes up the firing and the starter may be put out of gear. The action is as follows:—The engine being set on the "explosion stroke" with the gas cock turned on, and with the crank a little behind the top centre, the starting cam, B, having the square stud, Q, resting on its nose; the exhaust valve of the engine being set open; a charge of explosive mixture (gas and air) is pumped into the cylinder by the pump F. When the cylinder is filled with explosive mixture the exhaust valve is closed. The pumping being continued, the charge is slightly compressed till it propels the piston slowly and moves the cam, B, forward (clockwise) till it drops the roller, P, into the gap of the cam and releases the lever, M, the spring, R, rotating the plug of the ignition valve, towards the right, ignites the charge in the cylinder and propels the engine. If the pumping be still continued so as to keep the connections between the pump and the cylinder full of explosive mixture, the revolution of the cam, B, by opening and closing the ignition valve and exploding the charge at the proper times, will give successive impulses to the piston, increasing its speed until the ordinary igniting apparatus takes up the firing and the engine is effectually started. The starter is then thrown out of gear by pushing the handle, T, of the lever, M, to the left, when the catch, U, falls down and holds the lever, so that the roller, P, stands free of the cam, B, and the action of the starter ceases. The pumping into the cylinder of a full charge of explosive mixture is only necessary when the cylinder is filled with a spent charge or with gas. When filled with air (as is always the case if the engine when stopping has made a few revolutions after the gas was turned off) it is sufficient to pump a few strokes of gas only, and follow on with explosive mixture. In this case the exhaust valve must be left closed.

Water-Power.—Messrs. P. C. Middleton & Co., Aberdeen, who recently completed the large water-power installation at Braemar for Mr. A. H. Farquharson, of Invercauld, have been entrusted with the electric lighting of Invercauld House. Water-power will be used, and 300 lights will be installed.

Werner Cadmium Accumulator Syndicate, Limited.—We are informed that a meeting of the directors of the Werner Cadmium Accumulator Syndicate, Limited, was held at 41, Devonshire Chambers, Bishopsgate Street Without, on Saturday, Mr. Alexis Werner, D.Sc., in the chair, when a satisfactory report was made as to the progress of the company. It was stated that important tests have been made and several orders have been booked for train lighting and traction. The chairman reported that progress was being made with the arrangement for floating a company in Paris, where the use of accumulators for traction is very extensive, and a letter from Belgium was read, with a proposal for the purchase of the patent rights for that country.

ELECTRIC LIGHTING NOTES.

Aberdeen.—At a recent Council meeting, Mr. Blackman's resignation from the post of electrical engineer was discussed. It was generally regretted that a greater effort had not been made to retain good engineers at higher salaries. Mr. Blackman is coming to London, and Aberdeen is to engage another engineer at the same salary as it paid him, £225. The Council passed a resolution thanking Mr. Blackman for his services.

Ambleside.—The electric lighting question has been before the District Council at a special meeting this week.

Barking.—The Council has received the sanction of the Local Government Board to borrow £15,000 for electric lighting.

Barnes.—The Board of Trade has issued a provisional order to the Urban District Council empowering them to supply electricity throughout the whole of the area within their jurisdiction, but excluding Hammersmith Bridge.

Bedford.—The Town Council, having applied for a loan of £5,400 for electric light extensions, Mr. H. H. Law will hold a Local Government Board inquiry on June 15th.

Belfast.—The Council has resolved to make a charge of 7d. per unit for the current supplied for lighting purposes for the first hour and a half, and 2d. per unit afterwards; 4d. per unit for current supplied for motor and heating purposes for the first hour and a half, and 1½d. per unit afterwards; and 5d. per unit for church lighting.

Belgium.—Five firms sent in tenders for the supply and erection of the plant for the electric lighting of the railway station at Ghent for the Belgian State Railway authorities, the lowest being that of Messrs. Dierman & Co., of Liege.

Bermondsey.—At Monday's Vestry meeting, Mr. Cox, chairman of the Electric Lighting Committee, brought up a report of the proceedings of a meeting of the Committee held that afternoon. He stated that the Vestry would be aware that the Board of Trade had granted a provisional order, and that the Bill to confirm the order had already been read a first time in the House of Commons. The speaker read a letter from Sir Courtenay Boyle, stating that it was not without hesitation that the Board decided to grant the order in view of the objections put forward by the London Electric Supply Corporation and the County of London and Brush Electric Lighting Company. The Board of Trade, the letter proceeded, had granted the provisional order with a view to giving Parliament an opportunity of expressing its opinion on the subject, and the Board intimated that should the order be opposed in Parliament, it would be necessary for the Vestry to take steps to support the Bill. Mr. Cox went on to say that the electric light companies had only laid mains in the parish for the purpose of supplying other districts, and that they were liable to penalties for not fulfilling their obligations. With regard to the confirmatory Bill, which was down for second reading this week, Mr. Cripps had given notice of motion that the Bill should be read "that day six months." Should the Bill pass its second reading, it would be referred to a committee, and it would then be necessary to secure the services of counsel in the event of opposition at that stage. The Electric Lighting Committee accordingly recommended, and the Vestry decided to give them permission to engage counsel to promote the interests of the Bill. With reference to the forthcoming telephone conference convened by the County Council, the General Purposes Committee reported having received a letter from the London County Council, stating that since sending out invitations for the conference, the report of the Joint Select Committee of both Houses of Parliament on the supply of electrical energy in bulk had been issued. The report raised some important questions affecting London, especially as regards the erection and subsequent purchase by local authorities of generating stations for the supply of electrical energy. The letter further stated that it had been decided to bring these matters forward for discussion at the conference to be held on June 14th, after the matters relative to the telephone service had been disposed of.

Bethnal Green.—The Board of Guardians Finance Committee has had under consideration a demand from the contractor, whose tender for the laying of an electric lighting plant at the new infirmary had been accepted, for an additional sum of money in order to carry out the work, so that the amount of that tender now reached £5,394. The committee offered Messrs. Calvert & Co. the sum of £5,000 to do the work, but they refused. It was decided to again advertise for tenders.

In anticipation of the Vestry carrying out the electric lighting of the parish, an electricity committee has been appointed to have all matters in regard thereto under its control. The committee is as follows:—Messrs. Hales, Mundy, Brooks, Kippins, E. Jones, W. H. Clark, Goodwin, White, H. Jones, Pitt, and Styles.

Bexhill.—The Local Government Board have sanctioned the proposal of the Council to borrow £20,000 for electric lighting purposes.

Birmingham.—In regard to the question of municipal purchase of the electricity undertaking, it is announced that at the City Council meeting on 14th inst. the report of the General Purposes Committee will be presented. The report is stated to show the great increase in the business and profits of the company since 1895, and recommends that the undertaking should be purchased if it can be obtained upon fair and reasonable terms. The Committee admit the necessity of taking market price as the basis for fixing the purchase money, and they offered, subject to certain conditions, to give the company £10 10s. per share (or £420,000), taking over the undertaking as a going concern, with all its assets and liabilities, as from January 1st last. The directors have expressed their willingness to recommend the acceptance of this offer to their shareholders. The Committee have received a report from engineers whom they instructed to examine the company's works and mains, showing that the whole of the buildings, plant, and machinery have been well designed, and so arranged as to be capable of easy, and therefore economical, extension as the business increases, and that they are in good condition, and in every respect suitable for the work they have to do. It will be necessary for the Corporation to obtain Parliamentary sanction for the purchase and the borrowing of the necessary capital. The total sum required to be borrowed will have to be repaid within such period as may be fixed by the Act. Upon a 42 years' period the annual charge to the Corporation for interest and sinking fund will be £16,275, on a 2½ per cent. basis, or £17,000 on a 2¾ per cent. basis, against which the Corporation will have an undertaking which for 1897 produced a gross profit of nearly £13,000, which it is safe to assume from the growth of supply in the last few years, will in a short time be not only sufficient to meet loan charges but to give an increasing margin on revenue account. The Committee therefore recommend the Council to purchase the undertaking on the terms now reported, and to authorise the Committee to take all necessary steps for promoting a Bill in Parliament during the next ensuing session for giving effect thereto.

Bognor.—The Urban Council have decided to appoint a committee to consider a public and private electric lighting scheme.

Brighton.—The Council last week adopted the report of the Lighting Committee, showing for what purposes it is proposed to borrow a further sum of £56,300 for the development of the electric light undertaking. In view of the congestion in the engineering and manufacturing trades, the Committee had been advised to apply for borrowing powers for at least two years' requirements, so as to avoid, as much as possible, a recurrence of the serious state of overload the works were in at the commencement of last winter, owing to growth of the business having been exceptionally rapid. The estimate for the two years' requirements is as follows:—

Four steam dynamos	£21,980
Additional 10-ton traveller	300
Two new feeders	6,300
Additional distributing mains	12,600
House services and meters	15,120
	£56,300

The total expenditure and liabilities up to the end of 1897 stands at £229,375. Application will be made to the Local Government Board for power to borrow the money.

Buckley.—The Lighting Sub-committee have under consideration an electric lighting scheme, and will shortly lay a report before the Council.

Bury.—At the Town Council meeting on Thursday week, the salary of the electrical engineer (Mr. Watson) was advanced from £200 to £250 per annum. The chairman of the Electric Lighting Committee (Mr. Pickup) explained why they had recommended the increase, and submitted a number of statistics showing that, although in its electric lighting scheme Bury was very similar to Oldham, Bolton, Dewsbury, Burnley, and Lancaster, they did not pay as much in salaries as those boroughs. He said that Bury paid £76 per annum more than the five towns named for sinking fund and interest, and the loss was only £46 more. Their income at Bury was £1,318 on the year, as against an average of £1,730 in the other places. The average salary paid to the electrical engineer in the five boroughs was £275 per annum, and in Bury only £200 had been given. Mr. Pickup also submitted figures to show that Bury produced electricity cheaper than the average of the five towns named, and on all these points being considered, the advance of £50 to their engineer was, in his opinion, well deserved. The vote for the increase was unanimous

Cardiff.—Mr. Applebee, the electrical engineer, has reported to the Lighting Committee on the lighting of a portion of Newport Road by electricity. It would require, he says, 15 arc lamps of the same power as those in use for the centre of the town. The standards should be fitted with brackets for glow lamps to be lighted after midnight. Capital outlay £470. If this system were adopted, the lamps would be lighted directly from the current in the service mains by men employed for the purpose. This would greatly reduce the capital cost, because rectifiers, which now have to be supplied in the centre of the town, would be avoided. The committee adopted the report.

Colchester. — Representatives of the Electric Light Works Committee have had interviews with Mr. Massey and Messrs. Siemens, respecting the supply of fittings and wiring of consumers' premises, and reported the views of Mr. Massey and Messrs. Siemens on the subject. The Committee has resolved that further consideration be adjourned.

Colwyn Bay.—A Local Government Board inquiry was held on 2nd inst. in regard to the District Council's application for sanction to borrow £2,000 for the electric lighting of the promenade. Mr. Clirehugh gave evidence as to the details of the scheme, stating that the plant would not be in duplicate for reasons stated in the scheme. There will be 24 arc lamps placed on 21-feet columns along the promenade. The scheme was opposed by Councillor Wm. Davies, who was in favour of an installation which had been proposed for supplying the whole town rather than confining it to the promenade.

Crewe.—On 1st inst. the Town Council considered communications from Dr. John Hopkinson regarding his fees for reporting upon electric lighting and supervising the carrying out of a scheme. In one of his letters Dr. Hopkinson said that if his partner, Mr. C. Hopkinson, took charge of the refuse destructor matter, his fee would be 50 guineas. The Council accepted Dr. Hopkinson's terms of 100 guineas for a report on an electric lighting scheme for the borough, including one visit to Crewe, and a detailed estimate of capital outlay.

Devonport.—After visiting the town, Prof. Kennedy advises that the site adjoining the Corporation property at Pottery Quay is suitable for the electricity station.

Dover.—The Dover Electricity Supply Company intends on July 1st to reduce the charges for current.

East Grinstead.—Several would-be promoters of electric lighting schemes have been informed by the General Purposes Committee that any discussion discussing the matter are at present premature. It will be remembered that the Council is considering the question.

Glasgow.—Mr. W. A. Chamen, the borough electrical engineer, has reported on the lighting of St. Andrew's Halls. He says that arc lighting for a hall of this kind will never be made pleasing to the public. After going into the matter, he finds that two rows of seven electroliers, containing 17 16-C.P. lamps each, will be sufficient to light the main body of the hall, whilst the orchestra can be lighted by two more similar electroliers, supplemented by some brackets at the back. The present incandescent lighting of the back gallery will need to be increased by the addition of eight more 16-candle-power lamps fixed in the ceiling. The amount of electric energy consumed by the incandescent lighting now recommended will be double what is at present used for arc lighting. For the Berkeley and Kent Halls similar electroliers, with about 10 lights each, will be required. The cost of making the alterations would not be great, as the arc lamps would probably be transferred for use in other buildings belonging to the Corporation which are about to be lighted, or made use of in some other way. New electroliers would have to be purchased, together with a few brackets. The whole cost, including slight alterations to the wiring, and substitution of short pendant fittings under the galleries in the large hall, in place of the ship's fittings at present in use, would not exceed £300. The committee recommends that Mr. Chamen be authorised to proceed with the work, but meanwhile only in the large hall.

Guildford.—The Council has accepted the offer of Mr. J. M. V. Money Kent, on behalf of the Guildford Electricity Supply Company, to pay the sum of £30 in satisfaction of the claim made by the Council for damage to the paving.

Hackney.—The new Vestry had a long discussion on 1st inst. on the electric lighting question. Some members are clearly pledged to do their level best to prevent the scheme being carried out The Electric Lighting Committee is made up as follows:— T. Barnett, W. L. Beurle, E. Errington, W. Hammer, F. W. Hart, G. Hassmer, W. H. Netting, G. A. Ogan, J. W. Sandwell, J. Sheehan, A. Walmsley, and L. Whitemore. There is now every reason for believing that the Vestry will soon get to work upon an installation.

Hastings.—The Local Government Board have asked the Hastings Town Council to obtain the report of a competent engineer upon the question of the Council's application to borrow £58,000 for the purchase of the Electric Light Company's undertaking.

Islington.—Our readers have heard Mr. Lambert's name mentioned over and over again in connection with the electric lighting undertaking; in fact, the success of the works might safely be called the success of Mr. Lambert. We therefore notice with regret that the progressive majority on the Vestry proposes to oust him from the chairmanship of the Electric Lighting Committee. The difficulty is to see any good reason for this move. The local press is expressing itself in strong terms on the matter.

Lancaster.—The Corporation Gas Department is feeling the opposition of electricity. Last year the amount sold to private consumers was £249 3s. 1d. less than the previous year, or £1,799 6s. 7d. less than the year ending March, 1895, which was the high water mark in the sale of gas. The increase in the amount for electricity last year was £699 12s. 2d. In the last three years the increase has amounted to £1,146 16s. 4d. The Lighting Committee's altered expenditure has affected the Gas Department, for whereas in 1894-5 the outlay on gas lighting was £1,934, and on electricity £133, these items cost in 1897-8, gas £1,726, and electricity £505. In the other Corporation departments there are increases in the consumption of both gas and electricity.

Leeds.—The Leeds Corporation and House-to-House Electricity Provisional Powers have been granted to the Leeds Corporation for the purchase of the electrical system and plant of the Yorkshire House-to-House Electricity Company.

Lewes.—The Town Council has resolved that the question of opening up negotiations with a company with a view to taking up the provisional order for electric lighting be referred to the Finance and General Purposes Committee, with authority to negotiate terms for an agreement to be entered into, and to be hereafter submitted to the Council.

Lombardy.—As the use of electricity, both for lighting purposes and as a motive power, in Lombardy is constantly extending, says the *Financial Times*, there is consequently an ever-increasing demand for all kinds of electrical appliances connected with its development. At present Switzerland and Germany would appear to have the lion's share of the business in supplying the machinery, and our Consul points out that British engineering firms do not seem to be making any effort to secure a share of it. In 1899 the centenary of Volta's discovery of the electric pile is to be celebrated in Como, his native town, by an International exhibition of electrical appliances, and in due time our Consul promises to send full particulars of the conditions on which firms are to be invited to exhibit. In the meantime British manufacturers of electrical machinery might find it to their interest to give the matter their attention.

Londonderry.—The Corporation last week held a special meeting to consider the offer of the New General Traction Company, Limited, to take over the entire electrical plant of the city, to light the streets as at present, and to supply private light and power to all applicants. Dr. Todd, solicitor, said that the company were prepared to take over the plant at a valuation. They bound themselves to give light to the public lamps at £15 10s. per lamp, to give private lighting at 4d. per unit, and power at 2½d. per unit. The company owned 11 miles of tramways in Coventry, 20 miles in Norwich, and four miles in the Isle of Man. It had an invested capital of half a million. Councillor Thompson asked what guarantee there was that the company would carry out what they offered. Dr. Todd said the best guarantee was, that they would spend about £100,000 in laying down plant. They had in view the working of the Strand tramway by electricity. He estimated that there would be a saving of £1,360 on the public lighting. In that, of course, he included £1,000 for depreciation at the rate of 5 per cent. Alderman O'Doherty said the danger was, that when they came to make up the valuation they might be told that their plant was antiquated, and not worth much. The better way would be for the company to mention a lump sum of the basis of the negotiations. Eventually the Corporation appointed a small committee to confer with Dr. Todd and report.

Ludlow.—The Town Council will hold a special meeting on July 7th to consider whether an electric lighting order shall be applied for.

Northampton.—The Town Council, which is desirous of erecting refuse destructors in the town at once, has temporarily postponed all questions of details until the result is known of the negotiations with the Northampton Electric Light and Power Company for the purchase of the company by the town, and with the Northampton Tramways Company for the purchase of their system by the municipality. In the event of both purchases being made, the town will combine refuse destruction with the generation of electricity, which, amongst other things, will be employed for tramcar traction.

Oldham.—At a meeting of the Electric Lighting Committee on Wednesday, Mr. Newington, electrical engineer, presented a return of the electricity works. The works were commenced in 1894, and the total cost for fourth year (1897-8) has been £2,345, against 1896-7 of £2,533. The number of units sold during the year was 322,203, against 227,932 in the previous year. The average price obtained was from private consumers 4·28d., and from public 3d., against 5·7d. and 4d. last year. The gross profit made before setting aside instalments for interest and sinking funds, was £3,492 against £2,946. The total cost per unit was 1·746d., the decrease being 0·921d. The producing of supply at such a low price is considered very satisfactory. Mr. Newington said that the output was nearly as much as the plant could meet, although extensions had been made recently.

Pembroke.—Last Saturday a Local Government Board inquiry was held with reference to the Town Commissioners' application for a £33,000 loan for electric lighting. Mr. Robert Hammond gave evidence regarding the scheme. He stated that the tenders received, including boiler house, engine house, switchboard, accumulators, all the underground work and the meters, amounted to £19,354, against the engineer's estimate of £19,850. The cost of the condensing plant was estimated at £1,500. They proposed to use a triple concentric cable, which would be thoroughly insulated, lead covered, and steel armoured, and not at high tension. They were laying down two dynamos of very first-class make, which could do 5,000 lights, which would be capable of supplying 12,000 lights on consumers' premises. The distribution was to be on the three-wire system, the total length of the cables being 14,100 yards. The cost of the buildings is put at £6,000, with the exception of the destructor works.

Penarth.—The Board of Trade has issued a provisional order to the Penarth Electric Lighting Company, Limited.

Peterborough.—The Town Council had a discussion last week regarding the salary to be paid to the newly-appointed electrical engineer, Mr. Gill. The Lighting Committee had resolved to pay £100 a year, but last week the Council reversed this decision by nine votes to eight, and made the salary £50.

Reading.—A deputation recently waited upon the Board of Trade upon the matter of the amended description of the systems of supply to be adopted by the Reading Electric Supply Company. The Board wrote to the company, stating that they are not satisfied that the reasons urged on behalf of the Corporation are such as would justify them in withholding their consent to the proposed change of system, and they propose to approve the amended description. The Reading Electric Light Company recently wrote to the Council asking them to adopt electricity for street lighting, but the Lighting Committee has recommended the Council that the company be informed that if the Council determine to light the public streets by electricity, they will probably provide works for the supply of energy for that and other purposes. The Reading Electric Supply Company intend to alter the standard pressure of their supply at consumers' terminals from 100 to 200 volts.

Rhodesia.—We understand that the electric light is being installed at the B.S.A. Police Camp, Government House, which is four miles from Buluwayo.

Shoreditch.—At the first Vestry meeting after the election, held on Tuesday night, Mr. S. G. Porter was unanimously selected as chairman for the ensuing year. The Lighting Committee recommended and the Vestry decided to insure the economiser at the electricity works with Messrs. Green & Sons, Limited, of Manchester, for the sum of £500, at an annual premium of £3 10s., the rate to include periodical inspection of the economiser. The same Committee announced that it had been agreed that Mr. Russell, the chief electrical engineer, should supervise the arrangements for supplying steam to the baths and wash houses.

Tipton.—The Midland Electric Corporation has intimated to the District Council that it will accept a maximum of 3d. instead of 3½d. per unit. These terms the Council considered satisfactory.

Walthamstow.—A Local Government Board inquiry was held recently into an application by the District Council for sanction to borrow £5,200 for about two acres of land as a site for an electric lighting station and a stone yard. Mr. Enright, the electrical engineer, spoke strongly in favour of the site, and said the saving on the cartage of coals would alone pay the interest on the money. The whole district could be lighted from this station at the lowest possible cost.

Watford.—A Local Government Board inquiry was held on 31st ult. in regard to the Council's proposal to borrow £21,000 for electric lighting. Mr. Hawtayne, consulting electrical engineer, explained the scheme. He calculated an immediate demand for 8,000 lights. 130,000 Board of Trade units would be required for lighting the streets, and the present lamp standards could be utilised. He had some idea of putting arc lamps in the High Street and part of Queen's Road. For private lighting there would be 4,000 lights of 8 C.P.; public lighting, 363 of 16 C.P.; and 100 of 32 C.P., making 5,126 lamps of 8 C.P. He had considered several sites, and had come to the conclusion that the best was the one adjoining the sewage works. The estimated cost of the building was £3,000, and it would be handy for coal delivery. There was no opposition.

Wednesbury.—At Monday's Council meeting the General Purposes Committee recommended the Council to withdraw its opposition to the application of the Midland Electric Corporation upon the terms that the Corporation supply electricity to the Council for lighting and power purposes within an area agreed upon the same terms and conditions (if any) as may hereafter be agreed upon with the local authorities of West Bromwich, Oldbury, and Smethwick; that the Corporation will not oppose the application of the Town Council for an electric lighting order at any future date. On Monday, when the matter was discussed, Alderman Williams said he believed the whole thing was intended to put a stop to the action of the Midland Electric Corporation. They ought rather to be glad that people were prepared to bring electricity to them for the benefit of the town. Alderman Lloyd also argued that encouragement should be given to schemes for the development of new industries in the borough. The above proposals were adopted.

Whitechapel.—It is stated that the District Board of Works is asking the Brighton Corporation electrical engineer (Mr. Wright) to advise upon the electric lighting of the district.

Wigan.—At the Council meeting on 1st inst., Mr. Alderman Holmes, in moving the confirmation of the minutes of the Gas and Electric Lighting Committee, said that the question of electric lighting, which was brought forward at the last meeting and deferred, was again deferred by the Committee until after an expression of opinion had been given by the Council. The Committee felt that that was one of those matters that must be connected with a loss to the town for some years to come, if adopted. They therefore wished to have the full sanction of the Council behind them before proceeding any further. Mr. Worthington said, with regard to the electric lighting, although that matter had gone back to the Gas Committee, it had come back again to them in the same form. Since then he had acquainted himself more with the subject, and he would be prepared now to endorse the resolution that was previously sent back, with regard to the appointment of a sub-committee. He found that so far back as 1890 there was an electric lighting order which had received the Royal assent in favour of Wigan, and which only applied for two years, or during such a period as the Local Government Board might consent to extend it, and he believed that it was open to a company or syndicate to apply to the Local Government Board for the transference of the power of the order to them in order that they might supply electric light to the town. It seemed that they were in a rather difficult position. They had a gas works with a capital of £350,000 on the one hand, and they were loth to interfere in any way that would reduce the assistance that the rate got from that very important undertaking. On the other hand, it might be that some company might be disposed to supply the town with electric light. And let them suppose that after a loss for a little time that company eventually turned to a profit, then they would have the same competition from an outside company that they were supposed to have from themselves if they adopted electric light. If the outside company went on making a profit, and if the Corporation wanted to turn the electric light to themselves, they would be in the same dilemma as when they bought the gasworks, and would have to purchase them at far more than the original cost. Electric lighting had made important strides since the the last committee met, and he believed in the appointment of a small committee of the Council, apart from the Gas Committee. After discussion, the Council appointed a sub-committee to make inquiries, and with the powers to employ experts to advise them, so that they would be able to recommend to the Council something definite upon which they could act, and which would prevent the electric lighting going into other hands.

Winchester.—Last week the City Council had before it tenders from the Winchester Electric Lighting Company and the Water and Gas Company for lighting the streets. The Gas Company's tender was accepted.

York.—The Local Government Board has sanctioned the borrowing of £20,000 for electric lighting purposes. At Monday's Council meeting it was stated that Prof. Kennedy reported that Messrs. Crompton & Co. now found that they could not recommend the lowest priced engines accepted by the Corporation. The Electric Light Committee, therefore, had decided to instruct Messrs. Crompton to obtain the better class engines mentioned in the tender, and the cost of the plant would therefore be increased from £8,176 to £8,654. It was stated that the Committee would now push the matter forward as fast as they could, and they hoped that some time within the next 12 months they might be able to see the electric light established in the city.

ELECTRIC TRACTION AND MOTIVE POWER NOTES.

Barnsley.—The Streets, Buildings, and Improvement Committee of the Town Council have been considering the question of tramways for the town, and have now expressed the opinion that it is desirable such tramways should be established and worked by a company and not by the Corporation. Their recommendation that the Council invite companies to submit schemes of tramways for the town, and give consent to an application for the necessary Parliamentary powers to construct tramways in the borough, was before the Council on Tuesday. The Lighting Committee recommend that instructions be given to Mr. Miller to prepare plans and details of the proposed electric lighting scheme (see ELECTRICAL REVIEW, May 20th), and that application to borrow £23,322 to pay for such works be made.

Belfast.—The Tramway Company has written to a Corporation Committee saying that the directors have again been going into the matter of electric traction, and as there was a rapidly growing feeling among the public, they are willing to make another effort to come to terms with the Corporation for its introduction in Belfast. The Corporation has accordingly appointed a small committee to meet the directors to go into the matter.

Birmingham.—The Lord Mayor has sent to the *Birmingham Daily Post* copies of the letters which have recently passed between the City of Birmingham Tramways Company and the Corporation in regard to the proposed introduction of the overhead wire on a section of the lines.

The City Council had a lengthy discussion on the tramway question on Tuesday, the end of which was that it was decided by 28 votes to 27 (six neutrals) not to re-open negotiations with the Tramway Company, as the company has failed to carry out their arrangement with the Public Works Committee, and Mr. Ross, the chairman of the company, has made statements, which were incorrect, *re* authority to use the overhead trolley.

Brighton.—In the House of Commons on Monday, Mr. Ritchie informed Mr. Bowles that the electric railway from the Aquarium to Preston Place Groyne, Brighton, was constructed on land belonging to the Corporation, without Act of Parliament. As it was above high-water mark, the sanction of the Board of Trade was not necessary, and he had no jurisdiction over the railway. With regard to the Brighton and Rottingdean Sea Shore Electric Tramroad, the provisions of the private Act were not binding on the company, unless otherwise agreed between the company and the Corporation, who were the owners of the foreshore on which the line was constructed. The consent of the Board of Trade was given to the construction of the works below high-water mark, including the poles for the overhead wires. He was not aware that the public and boatmen were exposed to any danger, but as to the possibility of depriving them of their right to use the foreshore, he would make inquiries, though he did not think the Board of Trade had any power in the matter.

Bristol.—The following figures show the popularity of the electric tramway service on Whit Monday:—Last year on Whit Monday 104 cars were run and 127,387 passengers carried. This year 121 cars were run and 130,851 passengers carried, being an increase of 3,464 passengers. Of the above number this year no fewer than 50,817 were carried on the Staple Hill and Kingswood electric lines.

Chatham and Gillingham.—During last week both the Chatham Corporation and the Gillingham Urban District Council had under discussion a scheme for the introduction of an electric tramway in certain parts of the district. A special feature is the provision of workmen's cars. The Light Railways Commissioners, at their recent inquiry, cut out what is known as the High Street route, considering that the street was too narrow to admit of the proper working of trams, but there is very little doubt now that the trams will be introduced in this district, and will run from the Dockyard to Gillingham and Luton. The great question now under discussion is the conditions to be carried out by the company as to providing workmen's carriages. The promoters of the scheme have put forward their views as to providing workmen's cars, and the company will agree to contribute £6,000 towards the cost of widening the street, and £1,500 towards the erection of a new bridge across Railway Street. Some of the Council are in favour of the Corporation having the trams in their own hands, while others wish the company to take the matter up at once, considering they would be a benefit to the towns and the trade generally.

The Light Railways Commissioners concluded their inquiry on on Monday at the Sun Hotel, Chatham, for determining the expediency of granting the application made to them by the Rochester, Chatham, Gillingham and District Electric Railways Company, Limited, for an order to authorise the construction of an electric railway through the district. The Commissioners have decided to recommend that the order be made, and tramlines will be laid to and from the dockyard gates to the Brook and Military Road, and from thence along the Brook to Luton, and also from the upper and lower dockyard gates to Old Brompton and New Brompton, and also Gillingham. This will be a great boon to the district.

Dover.—Our local correspondent informs us that so successful have been the Dover Municipal electric trolley trams during the six months they have been running, that the Corporation were, as a consequence, able to reduce the town rates by 2d. in the £. There are four miles of tramways, and the fare 1d. any distance. More new cars are on order, and as soon as these arrive, a five minutes regular service is to be established.

The electric trams did well on Whit Monday. £56 18s. being taken. This is over £1 more than on Easter Monday, and it is stated to be £39 18s. more than is necessary to cover the day's capital and working expenses.

Dudley and Stourbridge.—On 3rd inst., Sir Francis Marindin, inspector to the Board of Trade, made an inspection of the Dudley and Stourbridge tram line, in consequence of the formal application of the owners for a seven years' steam power license, the existing license terminating in the near future. Mr. S. Sellon (engineer to the British Electric Traction Company) was one of the party. During the inspection of the whole of the line it was stated that the application was merely a formal one, but that it was necessary; also that electric cars would be running in the coming autumn.

Dundee-Barnhill.—The Dundee Town Council has remitted this light electric railway scheme to the Works Committee, who will appoint a sub-committee to report upon the proposal.

Gateshead.—So that the Council may have a good idea what the electric trolley tramway system really is, the whole body is to go to Leeds to inspect the system there.

Glasgow.—A proposal is before the Corporation to raise the salary of the tramway manager from £1,250 to £1,500. This is in view of the change from horse to electric haulage. There is also a proposition that in view of the surplus in the tramway receipts, and of the introduction of electrical traction on the Springburn route, it be an instruction to the Tramway Committee to reduce the fares on that route as an experiment.

The Tramways Committee proposes various tramway extensions amounting altogether to 11·13 miles. The sub-committee have had under consideration communications from the British Electric Traction Company, who had given notice of plans, sections, &c., embodying full particulars of the proposed light railway extensions to the Paisley and Johnstone tramway system, and suggesting that a meeting might be arranged. Sir James Marwick wrote that the Corporation would oppose the proposals of the company to construct a light railway on a road on which the Corporation had been authorised by Parliament to construct an extension of their tramway system. They would also oppose the company obtaining powers which would prevent such extension. The sub-committee had also a meeting with a sub-committee of the District Committee of the First or Upper District of Renfrewshire with reference to the application of the British Electric Traction Company. The Corporation Sub-Committee stated that they were prepared to recommend the Corporation to resist the application so far as relating to roads in or leading into the city, and to apply for powers to extend the Corporation tramways along Paisley Road from Halfway House to Paisley. They also stated that the Corporation, in the event of powers being obtained to construct a double line of tramways, would pave and maintain the roadway within the tramway rails and for 18 inches on the outside thereof, as in the case of other tramways. The County Sub-Committee of the Upper District stated that they were favourable to an arrangement being come to with the Corporation, provided the Corporation would undertake to lay the tramways in question within a limited period, and that they would report the result of the meeting to their committee. On the report by the general manager, the sub-committee have agreed to accept the offer of the Westinghouse Company to equip the High Street line for electric traction on practically the same terms as their contract for the Springburn line. It was also agreed that the convener should act as representing this committee on the sub-committee in charge of the lighting on the Springburn route.

Halifax.—The official opening of the municipal electric tramway was to take place yesterday (Thursday).

Harrogate and Knaresborough.—The promoters of the Harrogate and Knaresborough Light Railway have prepared the necessary plans, &c., and these are being deposited with the various public bodies interested in or affected by the scheme. The promoters have been encouraged by support from all the local authorities, with the exception of Harrogate. According to the plans the length of the direct line from Station Parade, Harrogate, to the terminus at Knaresborough is 3 miles 4 furlongs and 6 chains. Provision is also made for a loop line and sidings, so that altogether rails will be laid for distances of 4 miles 5 furlongs and 5 chains. The estimated cost is £76,000. What may be termed the main line starts near the Jubilee Monument in Harrogate, thence proceeds by Station Bridge and North Park Road to the Knaresborough Road, which it follows through Starbeck, and on to Knaresborough, terminating in Fisher Street. The loop line intended to serve High Harrogate leaves Station Parade in an opposite direction, but ultimately forms a junction with the main line in the Knaresborough Road. Electricity will be the motive power. It is proposed to have the generating station at Starbeck, to which access will be obtained by means of a short siding. The promotors also intend applying for powers to lay down a main to the generating station in order to utilise water at present running to waste.

Hull.—The arrangements for the commencement of the construction of the electric tramways and the repaving of the main streets with wood are about complete. A start at taking up the old rails has been made on the Hessle Road, and it was arranged that the first rail of the new sytem should be laid yesterday afternoon by the chairman of the Works Committee at the south end of Porter Street.

Leeds.—The City Council at a recent meeting decided to extend the electric tramways to the Headingley, Chapeltown, Hunslet and Dewsbury Road sections, and Dr. Hopkinson, under whose charge the Kirkstall and Roundhay sections were laid, was engaged to carry out the work. The Tramways Committee had a consultation with Dr. Hopkinson on Monday, and an electrical sub-committee was appointed to confer with that gentleman with regard to the enlargement of the generating station, the necessary engines, and other details. Estimates will shortly be obtained, and the work will then be proceeded with without delay. A model of an apparatus was exhibited to members of the committee, the object of which is to prevent accident to life or limb in the event of an overhead wire breaking, by automatically shutting off the current. The apparatus, for which a provisional patent was obtained last month by Mr. Ralph Bostock, licensed victualler, and Mr. Frank Arthur Cheetham, silk spinner, Brighouse, is attached to the poles, and it is claimed for it that as soon as a wire breaks, the current between the poles is shut off. Mr. Hannam (the chairman) and other members of the committee thought favourably of the invention, but suggested to the patentees that it should be tested with trolley wires of the same thickness as those in use in Leeds, a suggestion which they decided to adopt.

In consequence of the breaking of a guard wire last week, it is stated that thicker guard wires are to be used throughout the entire route.

Limerick.—The Electric Tramway Company, Limited, have notified their intention of applying for permission through the city and county grand juries for permission to lay down a series of tramways through the city and suburbs, the gauge varying from 3 feet 6 inches to 5 feet 3 inches. Though the scheme has been outlined, the plans have not yet been furnished.

Liverpool.—At last week's City Council meeting, Mr. C. Petrie submitted the recommendation of the Generating Stations Committee—"That the tender of Messrs. Willans and Robinson, Limited, Rugby, for the supply of two compound engines and dynamos at the price of £6,530 each, and one triple-expansion engine and dynamo at the price of £6,939, subject to a deduction of 2½ per cent. upon the respective amounts, be accepted." The engines, Mr. Petrie said, were for the generating station in Pumpfields, for lighting and traction. The question was purely technical, and the Council would be well advised in taking the opinion of its officials, who recommended the proposed engines. Some little misapprehension existed to the effect that there was a difference of opinion between the reports of Dr. Hopkinson and Mr. Holmes, their electrical engineer. He had mentioned this to Dr. Hopkinson, who had written stating:—"I am of opinion, and always have been of opinion, that the engines proposed by Mr. Holmes for the new large central station will give thoroughly satisfactory results both for traction and lighting." The committee's recommendation was referred back to the committee last month. The committee had since further considered it, and they felt, having the report of Mr. Holmes before them, that they could not alter their recommendation. It was only because the Council did not quite understand the matter that the recommendation was referred back. Many misleading statements were made last Council meeting. One was that the engines made 800 revolutions, whereas they made only 230. The committee had inquired fully into the question, and if they were not perfectly confident that this machinery would give the greatest possible satisfaction, they would not have recommended its purchase.—Alderman F. Smith seconded the recommendation.—Mr. Rutherford moved as an amendment: "That before ordering the high speed engines mentioned in the recommendation, the special committee be requested to obtain the unbiassed opinion of Sir Benjamin Baker, Sir Frederick Bramwell, Mr. Kincaid (of London), Mr. Pearson (of New York), or some other acknowledged authority of eminence and experience in electric traction upon the two questions (*a*) the unit of power; (*b*) the type of engines it would be best for Liverpool to adopt in the projected 10,000 horse-power power station at Pumpfields." He did not assert that the engines recommended were not the right kind to order, but he thought the Corporation should take the best authority on the subject before committing the city to a large expenditure. The recommendation was the same as that submitted at the last Council meeting, when it was sent back to the committee on its merits. Now, however, personal matters had been introduced into the consideration of the subject, and some members who voted against the recommendation last month had that day told him that they would now vote against him whatever he might say. Mr. Petrie had referred to Dr. Hopkinson's letter, and suggested that that letter got rid of the difficulty of the difference of opinion between Mr. Holmes and Dr. Hopkinson, but that opinion was not official. He had no personal hostility towards the committee, and he trusted that if his amendment should happen to be carried Mr. Petrie would not resign. On the other hand, he might assure them that were he (the speaker) beaten he would not resign. Mr. Rutherford proceeded at great length to give a history of the business from June 11th last year, when Mr. Holmes was asked to report on the electrical power for the trial route to the Dingle. He pointed out that Mr. Holmes considered that economy and efficiency would result from combining the generation of electricity for lighting and tramway traction. Mr. F. S. Pearson, who had had twice the experience of anybody else in electric tramcars, thought differently, and said so. That was why, when Mr. Pearson was proposed as consulting engineer, the electric light section of the Council, having determined to get control of the electricity for the trams, rose as one man against Mr. Pearson's appointment, and swore they would have none of him. Mr. Holmes now recommended for the new electric generating station at Pumpfields high speed machinery whose type was experimental, made by makers to whom the construction of the engines was an experiment, and modified besides by novelties in design which Mr. Holmes had introduced. He contended that Dr. Hopkinson had not endorsed, but excused, these recommendations, and in the course of an extended argument urged that slow speed engines were the best for developing large power like 2,500 or 3,000 electric horse-power, which ought to be the unit. They were entitled to know not whether these recommended engines would give satisfactory results, but whether they were the best type, and what was the best unit of power to adopt, because they were making a start with a huge undertaking which would not only provide light for the streets and traction for the tramways, but be eventually the source from which all the small industries of Liverpool would draw their power. Mr. Rutherford proceeded to urge that the proposed engines were unsuitable for traction purposes, because they were high speed, and, therefore, more difficult in governing any variability of load, and more liable to lead to accident on account of the high rate of speed. He cited various authorities showing that the slow speed engines were more suitable for traction purposes. At all events, he submitted there was a reasonable doubt as to which form of engine was the better, and expert evidence should be obtained upon it. The experience of the whole world was that slow speed engines should be used; but at least the Council before deciding upon any definite policy should take the opinion of the leading engineer in England—someone above petty considerations, and whose knowledge would guide them to a proper and just conclusion.—Mr. M. Hyslop Maxwell seconded the resolution.—Alderman Fred. Smith defended the action of the committee. Mr. Rutherford asked them to take the opinion of some expert. Had they not appointed Dr. Hopkinson as an expert? Referring to the unofficial letter sent by Dr. Hopkinson, the speaker contended that that gentleman would not go back upon the opinion therein expressed even in an unofficial letter. The alderman was proceeding to criticise Mr. Rutherford's speech, when the Council adjourned.

When the Council met again on the 3rd inst. the matter was continued in spite of Mr. Rutherford's proposal to withdraw his amendment. Mr. Petrie, as chairman of the committee, objected to that course because Mr. Rutherford had made certain statements which must be answered, and they had a complete answer to every one of them. Alderman F. Smith, who continued the debate, said that what he understood the Council desired to do was to undertake a very great and beneficent scheme of electric traction for Liverpool. In the preparation of that scheme the committee thought it desirable to provide two stations of 10,000 horse-power each. Mr. Rutherford had pictured the terrible effect that would happen to Liverpool in case all the tramcars were stopped at one moment. If Mr. Rutherford had been a little more candid with the Council he would have told them that he had asked this very question of the engineer, and that the engineer had explained to him that it would mean that Liverpool trams would run in four sections, so that no such disaster as that pictured by Mr. Rutherford could possibly take place. With regard to the type of engines that should be used undoubtedly there was no settled and absolute opinion even amongst the foremost electrical engineers. Alderman Smith then devoted himself to arguments justifying the committee's confidence in their electrical engineer. The only modification made by Mr. Holmes to adjust the engines to what he deemed to be the requirements of Liverpool was a change of fly-wheel. They wanted to put an engine down that would not wreck their station. The high-speed engine had a fly-wheel of not more than 16 tons, and had it within its dynamo. Whereas a slow speed had a fly-wheel, which was exposed, of about 60 tons. Accident was less likely with a high speed engine than a low speed engine. Electricity was a comparatively new science, and there was continual change and progress. Therefore, was it not reasonable that their able officials should be allowed to be in the van of progress, rather than following slavishly in the rear of other people? The committee followed Mr. Rutherford on another matter, and he led them into a little bit of disaster. The committee had to be led by somebody (Mr. Grant: Forwood), but were they going to be led by Mr. Rutherford, with the secondhand opinions of competitors for some of this Corporation work against the opinions of their capable officials. Mr. Rutherford was in this matter in a minority of one on the committee. With an expenditure of £20,000 the Council should trust the committee, if they were worthy to be trusted. As an individual member, he (Alderman Smith) had given the subject his best consideration, and had honestly come to the opinion that the advice of Mr. Holmes ought to be followed. Mr. Holmes was an electrical engineer of standing, worthy of being followed. He would follow Mr. Holmes until it was shown by competent authorities that he was wrong. The discussion was carried on at considerable length, and Mr. Petrie, the acting chairman of the Generating Committee, replied. He said that the committee never admitted that there was any difference between the report of Mr. Holmes and that of Dr. Hopkinson as to the type of engine to be purchased. Mr. Rutherford had discussed the question at the Council three or four times, and the points he raised had been answered intelligently and courteously by Mr. Holmes. Mr. Rutherford made statements which he had been told at the committee were wrong, and he had seen letters which intimated that he was wrong, yet he reasserted them at the Council. He had made the question a personal matter. He had said, "I will show you up in the Council. I will show your committee up in the Council and I will state a lot of things you won't like to hear." There was nothing any member of the committee had done that he was ashamed of. If Mr. Rutherford knew of anything he should have stated it to the Council. He had two hours of the Council's time on Wednesday, which was practically wasted, and had only "shown himself up." The engines referred to at Bristol and Dublin were made for lighting purposes, but were tried for traction and found unsuitable, because they were never intended for traction. It had been stated that these engines were not used for traction in this country at all. That was quite incorrect, and Mr. Rutherford knew it was incorrect. They had worked, and with very satisfactory results at one of the stations of the South London Railway Company. They had worked for two and a quarter years, and the repairs to them had practically been *nil*. As to the variability of load the firm was willing to give any reasonable guarantee that the engines would stand any strain of that kind. The South London Railway Company were so satisfied with the engines that they had ordered 16 (?) sets of plant, each of 1,000 horse-power, for the railway. The municipalities of Leeds and Bradford had tried them and were ordering additional ones for traction purposes. The Liverpool Corporation had tried the engines for electric lighting, and had found them very satisfactory, as shown by the fact that they were the second cheapest producers of electricity in the cities of the United Kingdom. The cost of the engines would be about £20,000. On May 4th the Council referred the committee's recommendation back; but, after careful consideration, the committee had come before them again with the same recommendation. The committee had been guided by their officials, and it was to the interests of the officials that they should recommend what was best for the city. The division was then taken, the voting for Mr. Rutherford's amendment being 12, and against 49.

Manchester.—A sub-committee of the Swinton and Pendlebury District Council have arranged with the solicitors to the Manchester Carriage Company that the tram lines which are to be laid in Pendlebury shall be laid so that the cars may, if thought proper at some future time be run by mechanical power without necessitating re-construction when it is decided to adopt electricity.

Newcastle.—On 3rd inst. letters were before the special committee from Dr. Hopkinson and Mr. Columb, stating their charges for advising *re* electric and cable traction. The committee has agreed to engage both gentlemen, and the city engineer is to supply them with plans showing the proposed routes. Both gentlemen are to draw their estimates from a given basis of mileage, weight of rails, strength of foundations, engines, and machinery of every description, and the quantity of rolling stock, both systems to be worked on a basis equal to a 2½ minutes' service. It was agreed to report meanwhile to the Council upon the routes which the committee considers should be included in the new scheme.

Norwich.—The recent action of the House of Commons Committee in cutting the Surrey Street route out of the electric tramway scheme has placed a serious obstacle in the way of the St. Stephen's Street and Newmarket Road line, and while it is not yet abandoned, no fresh steps have yet been taken to arrange for an alternative route. The Magdalen Road route also presents difficulties at present, owing to the operations in progress for sewerage, and this portion of the city cannot for some time be undertaken, although the line is likely to prove one of the most remunerative on the system. The contractors are therefore confined to three main routes, Thorpe Road, Dereham Road, and Aylsham Roads. All arrangements are now complete for the car sheds near the Prince of Denmark at Sprowston, and the building of these premises has begun.

Penarth-Cardiff.—On 1st inst. a public inquiry was held at Penarth by the Light Railway Commissioners (Earl of Jersey, Mr. G. A. R. FitzGerald, Colonel Boughey, and Viscount Emlyn, acting secretary), with regard to the proposed light electric railway from Penarth to Cardiff. Various local authorities, the Taff Vale Railway Company, and the Gas Light and Coke Company, were represented. Mr. Hans Hamilton appeared for the promoters. In opening the case he said the company was formed at the end of last year by some influential gentlemen in Cardiff and Penarth, and in conjunction with gentlemen who had been and who were connected very largely with electrical traction and electrical undertakings in London. So strong was the feeling in both towns of the necessity for the undertaking that, if necessary, all the capital could be found in Cardiff and Penarth alone. The nominal capital was £25,000, but power had been given to increase this if required. Penarth had an estimated population of between 17,000 and 18,000, and the population of Cardiff was 180,000. The distance from the Town Hall in Cardiff to the Post Office at Penarth was about four miles, and the traffic between the two towns consisted of gentlemen who resided at Penarth, and who went into Cardiff for business, whilst near the spot at where the proposed railway would commence, viz., Grangetown, there was a large and increasing working class population. If the light railway was granted, trams would be run every 10 minutes. The road between the two towns was privately owned by Lord Bute and Lord Windsor, and a portion of it was within the borough and a portion in the Penarth Urban District. It had been felt for some time that a great expansion of Penarth would follow if adequate communication was granted between the two towns, and in 1897 a syndicate was formed, called the Penarth Tramways Syndicate, of some of the leading inhabitants of Penarth and some of the principal business men of Cardiff, with the object of constructing electrical tramways in Cardiff and along the road proposed for the new light railway. The application was proposed to be made under the Tramways Act, but, as the Cardiff Corporation threatened to oppose, the project was dropped. The reason for the opposition at the time was, in the first place, the fact that the Cardiff Corporation desired to extend their borough boundary so as to include Penarth, and if the borough was extended they wished to construct the tramway themselves and to exercise their power of purchasing the existing tramways. As a result of the Local Government Board inquiry, however, the extension was not allowed, and that was why the present application was being made. The proposed light railway would commence where the houses ceased at Grangetown, and would end at the Post Office at Penarth, the total length being a little short of 3 miles. The Plymouth Road extension is dropped entirely. Lord Bute and Lord Windsor strongly advocated the construction of the light railway, and they would be willing, if the project was granted, to give land for the widening of the road wherever it was necessary. Counsel proceeded to deal at length with the objections of the Cardiff Corporation and the Taff Vale Railway Company.

Mr. Ll. B. Atkinson, electrical engineer at Cardiff, and residing at Penarth, said the gauge of the new line would be the standard gauge of 4 feet 8½ inches. The lines would be laid level with the surface of the road, and the road between the rails and for 18 inches on each side would be paved with granite setts or wood blocks at the option of the local authority. The railways proposed were four in number, No. 5 having been abandoned by arrangement with the District Council of Penarth. The four lines of rails would have a total length of 2 miles 5 furlongs and 6·60 chains, and would commence at Grangetown by a junction with the existing tramways. With regard to the inclines, Railways No. 1 and 2, from the commencement to the River Ely, would be on a practically level road, Railway No. 3, from the River Ely to Cogan Hill, would be on an incline of 1 in 19, and railway No. 4, which commenced on Cogan Hill, would have a maximum gradient of 1 in 13, for quite a short distance. It was proposed, however, to reduce this incline to 1 in 21. The width of the road was, for the most part, ample. The cost of widening the road had been included in the estimate. The mode of working the railway was by electricity with overhead wires, and the promoters were either prepared to erect their own generating stations or to enter into a contract with the Cardiff Corporation. A provisional agreement had been entered into by which the local authority could purchase the railway at any time after 10 years at a value excluding the goodwill, or, at any time after 35 years, they might purchase without a goodwill. He took it that the Cardiff Corporation would have the power of purchasing the portion in their district. It would be a single line, with loops for passing. He had known electric tramways to be erected on roads which had a greater incline than the Penarth Road. The speed would depend upon the local authorities, but he anticipated a speed of 9 or 9½ miles an hour, including stoppages.

Mr. Vivian Douglas Cooper, engineer, said that he estimated the total cost of the construction of the line would be, approximately, £19,043.

Mr. B. Francis Williams then proceeded with the opposition on behalf of the Cardiff Corporation. He called Mr. William Harpur, the borough engineer, who gave evidence against the scheme.

After hearing further evidence and holding a consultation among themselves, the Commissioners notified that they could not approve of the proposed arrangement between the promoters and the land owners, as it would hamper the municipality if they required to purchase. No. 1 railway had therefore to be left out, and after the opposition of the Taff Vale Railway had been heard, the Commissioners intimated that it was unwise to grant such a small bit of line as that proposed from Penarth to Ely Bridge, and the promoters withdrew their application.

Reading.—The Town Council on 2nd inst. adopted the following report of the Finance and General Purposes Committee:—"That the committee do recommend to the Council that an application be made to the Board of Trade for a provisional order in the next session of Parliament authorising the local authority to extend the existing tramways after they shall have been acquired by the local authority as follows, namely, from the terminus near the Cemetery to the South-Eastern Railway bridge in London Road and to St. Peter's Road, Earley Rise, and from the terminus near the barracks to the Pond House, and also authorising the local authority to work the tramways themselves and to use electricity and other mechanical power for working the same."—In the discussion Mr. Martin, chairman of the committee, said the reason why they did not propose any additional extension was because they had not decided on an important question, as to what their future traction should be, whether it should be electricity or a continuation of horse traction, or by compressed air or some other new traction which might crop up during the next two years. They would thus gain two years more experience, which he thought placed them at a decided advantage, instead of rushing into a scheme at the present moment and deciding off-hand what traction they would take up. In considering the question of traction, another element was the question of gauge, and if they decided on electric traction they would no doubt have to alter the gauge throughout the whole of the town, whether it be from east to west or north to south. They thought it much better to proceed by steps.—Mr. Wellman believed that the minds of most people were made up in favour of an electrical overhead scheme, and that they were convinced that it was no good waiting and sending a deputation all over the world to find out the best scheme. The example of those business men who had risked their own money in starting companies for laying down electric tramways ought to be good enough for them; anyhow, it was good enough for the large number of people of Reading. He believed, therefore, that their minds were made up to have a good and efficient service all over the town, and not only in the west and east, but to Caversham, Redlands, Whitley, Bath Road, and anywhere where there was a considerable population, it would be advisable and to their interest to extend the tramways. He felt sure that nothing short of a complete and efficient system would satisfy the town. They were at present a long way behind other towns, and if they simply stuck to the lines laid down by this meagre resolution of the committee they would greatly disappoint the town.—Mr. Bonny said he was in possession of figures which went to prove that an outlay of £100,000 would be ample to provide a system of electric trams from the Pond House to Earley Rise, and from Whitley to Caversham. He had no doubt it would be a very profitable venture. Under the present miserable and wretched system the company paid a dividend of 7 per cent., and there was not the slightest doubt that they could pay more than that on an outlay of £100,000. He was informed by experts that that sum would pay all expenses of new equipment, new lines, and the whole cost of the installation of electrical plant. The report was adopted with only two dissentients.

Redditch.—The Redditch District Electric Traction Company, Limited, has just been registered, with £2,000 capital, to promote and obtain the necessary authority to make and maintain light electric railways and tramways in the counties of Worcester and Warwick or elsewhere.

Sheffield.—The Tramways Committee recommend that the British Thomson-Houston Company be requested to fit one truck of the 25 cars now on order with roller bearings of the Roller Bearings Company, and another with those of the Mossberg Company, and that the British Thomson-Houston Company be requested to construct the new trucks to allow of such bearings being put in, if the tests prove satisfactory. It is also recommended that the tender of the British Thomson-Houston Company, Limited, for the electric equipments and the Peckham trucks for the 13 cars on order from Messrs. Milnes & Co., at £433 6s. 8d. per car be accepted, also that the tender of the British Thomson-Houston Company, Limited, for 12 single-deck cars, including electrical equipment and trucks, at the sum of £617 16s. 8d. per car, be accepted.

Stourbridge.—A Dudley paper says that the British Electric Traction Company are pushing on well with the work connected with the conversion of the tramway from Stourbridge to Hart's Hill into an electric line, but nothing is yet being done as regards a start with the Kinver line.

Tipton.—At last week's Council meeting, when the report of the deputation to a West Bromwich conference on the tramway question was read, Councillor Doughty said that no other local authority was in the same position as themselves. Wednesbury had everything to gain by the trams, as had West Bromwich, and Dudley had already expressed the opinion that they would take the trams into their own hands. Darlaston only possessed a mile or more of trams. He thought they would sanction almost any scheme that might be put forward in order to retain Tipton. Trams were an absolute necessity, but in his opinion the overhead system was not satisfactory, and he thought if they could induce any company to lay down a cable or conduit system it would be an advantage to the public. He thought they could reasonably ask any new company formed to put down the conduit system of electricity. He seconded the adoption of the report, and this was agreed to.

York.—At Monday's City Council meeting, Alderman Agar, in moving the confirmation of the minutes of the Streets and Buildings Committee, referred to the refusal of the committee to allow the York Tramways Company the use of electrical power for the haulage of their cars. He said this action had been taken exception to, but he was satisfied that if those who took exception to it knew that the company would use that power by overhead wires suspended on standards, they would at once see that that would cause a great block in their narrow streets, and that the committee had done right.

TELEGRAPH AND TELEPHONE NOTES.

Hereford Telephones. — Increased facilities for telephonic communication have now been afforded by the National Telephone Company and the Post Office. The town is now connected with the trunk service.

Soudan Telegraphs.—A Reuter despatch dated Suakim, June 5th, says that the telegraph lines from there to Kassala and Berber are being splendidly laid. Bimbashi Manifold has left for the front, *vid* Cairo, after completing his work at this end. Of the line to Kassala 130 miles have been laid, and of that to Berber 30. Both lines are expected to be completed in three months.

Telephone Communication between Brussels and Manchester.—It is stated that some experiments were made on 6th inst. with the telephone between Manchester and Brussels, the operators at the two cities being put in direct communication with each other. Both land and sea wires had to be utilised, the wires running from Brussels through Courtrai and Lille to Calais, where they were connected with the London-Paris telephone cable under the Straits of Dover.

CONTRACTS OPEN AND CLOSED.

OPEN.

Barnet.—June 24th. The Lighting Committee want tenders from firms willing to undertake such installation for lighting the district by electricity. Particulars at the Council offices, and see this week's "Official Notices."

Bethnal Green.—June 28th. The Board of Guardians invite tenders for supplying the necessary plant and installing the electric light at the new infirmary, Palestine Place. For particulars see our "Official Notices" this week.

Bournemouth.—June 20th. The Corporation is inviting tenders for the supply, &c., of cables, arc lamps, incandescent lamps, wiring, switchboards, fittings, &c.; also steam dynamo, &c. Particulars from the borough engineer, Mr. F. W. Lacey, also see our "Official Notices" May 27th.

Bulgaria.—June 27th. Some little time ago the municipal authorities of Sophia, Bulgaria, invited tenders for the concession for the electric lighting of the public streets of the city, and for the construction and working of an electric tramway. The authorities are again inviting tenders, until the 27th inst., for this concession, particulars of which may be obtained from above.

Bury St. Edmunds.—June 13th. The Corporation invites tenders for the supply and erection of Lancashire boilers, three 60-kw. steam dynamos, transformer and booster, accumulators, street mains, and various other machinery and apparatus for the electricity undertaking. Consulting engineer, Mr. F. H. Medhurst, 13, Victoria Street, S.W. See our "Official Notices" May 13th.

East London (Cape Colony).—June 28th. The Town Council is inviting tenders for erection of buildings and the supply of electric lighting machinery, electric tramcars, plant, rails, &c., and for their maintenance for six months from completion. Particulars from Messrs. Dyer & Dyer, 17, Aldermanbury, London, E.C., on payment of £5, repayable on the receipt of a *bonâ fide* tender.

Edinburgh.—June 14th. The Corporation wants tenders for the electric wiring of the police chambers (400 lamps). Particulars from the electrical engineer, Dewar Place, also see our "Official Notices" June 3rd.

Edinburgh.—June 14th. The Corporation wants tenders for the supply of cast-iron pipes, pavement boxes, and collars for joining earthenware casing. Particulars from the resident electrical engineer.

Llandudno.—June 16th. The District Council wants tenders for the supply of meters of various sizes for 12 months. See our "Official Notices" this week for details of sizes.

London.—June 21st. The London County Council is inviting tenders for engines, dynamos, accumulators, switchboards, feeders, distributors, and service mains and all accessories, to be fixed complete in buildings at the Crossness Outfall Works, near Erith, Kent. The L.C.C. also requires tenders for providing and fixing cables, wires, conductors, casing, pendants, brackets, and other fittings, columns, lanterns, lamps, switches, and switchboards, distributing boards, fuses, cut-outs, &c., necessary for the lighting by electricity of the Crossness pumping station and works, near Erith, Kent. Particulars of both contracts from the Engineer's Department, County Hall, Spring Gardens, S.W. See also our "Official Notices" May 27th.

Sheffield.—June 13th. The Tramway Committee is inviting tenders for the erection of an electric power station for its tramway scheme. Particulars from the City Surveyor.

Southampton.—June 20th. The Corporation invites tenders for the supply and erection of lamp columns, arc and incandescent lamps, automatic switches and fittings. Consulting engineers, Messrs. Kincaid, Waller & Manville. See our "Official Notices" June 3rd.

St. Pancras.—June 14th. The Vestry wants tenders for condensing plant, steam pipes, &c., for the Regent's Park electricity station. Particulars from the chief clerk, Electricity Department, 57, Pratt Street. See our "Official Notices" June 3rd.

Tynemouth.—June 20th. The Corporation wants tenders for the supply of steam dynamos, balancer and boosters, &c. Consulting engineers, Messrs. Lacey, Clirehugh & Sillar. See our "Official Notices" June 3rd, for particulars.

Victoria.—June 24th. The Council of the city of Hawthorne (Colony of Victoria, Australia) is inviting tenders for the supply and erection of buildings, boilers, engines, dynamos, transformers, mains, meters, arc lamps, poles; also running the plant for three years. See our "Official Notices" March 11th.

York.—June 24th. The Corporation is inviting tenders for the erection of an electric light station. Particulars from the City engineer, Guildhall.

CLOSED.

Aberdeen.—For electric wiring and fitting work at the new building at the bathing station the Council has given the contract to Mr. R. Botting at £117.

Balmoral Castle.—The Electric Construction Company, Bushbury, near Wolverhampton, are to supply the dynamos necessary for the installation of the electric light at Balmoral Castle.

Dundee.—The Electric Committee has accepted the following tenders for supply of steam coal for the electricity works:—Robert Taylor, 1,500 tons of Wallsend diamond nuts (Aitken) at 9s. per ton; W. Taylor & Co., 1,500 tons of No. 1 Hamilton small coal (Eddlewood ell), at 8s. 2d. per ton—all delivered at the electric lighting station.

Belfast.—After considering the tenders submitted for the wiring of the new police office and cells, the Corporation has given the contract to Mr. W. H. Drennan.

Harrogate.—The Town Council has accepted the tender of Mr. Steinthal for ornamental electric lamps for lighting the Spa and Gardens at £189.

West Ham.—Messrs. Veritys' tender for the electric fittings for West Ham Corporation has been accepted. There were 11 competitors. Messrs. Veritys' quotation, which was not the lowest, was for the supply of the fittings at 5 per cent. below the schedule price.

FORTHCOMING EVENTS.

1898.

Friday and Saturday, June 10th and 11th.—Municipal Electrical Association Conference continued.

Friday, June 10th, at 8 30 p.m.—The Institution of Junior Engineers at the Westminster Palace Hotel. Special meeting to welcome Sir T. Salter Pyne, C.S.I., honorary member of the Institution.

At 5 p.m.—Physical Society. Agenda:—1. Exhibition of a Model illustrating Dr. Max Meyer's new theory of Audition, by Prof. S. P. Thompson, F.R.S.; 2. "Attenuation of Electric Waves along a line of negligible Leakage," by E. H. Barton, D.Sc; 3. "Diffusion Convection," by A. Griffiths, B.Sc.

Thursday, June 16th, at 9 p.m.—Institution of Electrical Engineers' Conversazione at the National History Museum, South Kensington.

At 8 p.m.—Chemical Society, Burlington House. Papers to be read:—"Preparation of a Standard Acid Solution by Direct Absorption of Hydrogen Chloride," by G. T. Moody, D.Sc.; "Researches on the Terpenes. III.—Halogen Derivatives of Fenchene and their Reactions," by J. A. Gardner, M.A., and G. B. Cockburn, B.A.; "Researches on the Terpenes. IV.—On the Oxidation of Fenchene," by J. A. Gardner, M.A., and J. B. Cockburn, B.A. Ballot for the election of Fellows.

NOTES.

The Municipals' Dinner.—The dinner of the Municipal Electrical Association was held on Wednesday evening at the Holborn Restaurant.

Errata.—On page 751 of last week's issue, line 17 right-hand column, for "torque" read "tongue;" and on page 755, line 11, for "with resistances *and* effect," read *an* effect.

On page 752 of last week's ELECTRICAL REVIEW an error arises in Mr. Apps's Röntgen Society paper on "A New Induction Coil." In line 35, for 4½ inches read 44½ inches.

Lighthouse Illumination.—An important alteration is to be carried out in connection with the revolving light at Cape Gris Nez. A new lighthouse is to be erected, much higher than the present one, so that the light will be seen at a distance of 48 miles. It is to be an electric light, having a white flash every second, and the candle-power will be no less than 3 millions. It is computed that the light will pierce the fog for a distance of 16 miles.

Machinery Interviews. — *Machinery*, of South Africa, is one of those papers which goes the length of publishing so-called interviews with machinery builders. A recent number contains one such with Mr. Norbury, of Galloway's, Limited, the Manchester boiler makers, which is in the worst possible style of interview, being little else than a clumsy vehicle for carrying certain statistics as to Messrs. Galloway's works, which would have been far better described in a regular descriptive article and of more interest, besides giving less prominence to a list of exhibition awards as tedious as the interminable list of things which constitutes the poetry of Walt Whitman. We do not think that the views propounded as to steam jacketting will meet the approval of many engineers. If anyone has found the steam jacket to be as described simply a means of robbing Peter to pay Paul, we should advise a reform in the construction of the jacket and a perusal of Fletcher's little book on the steam jacket. We are glad to find nevertheless that Mr. Norbury has been to Johannesburg, and think that other leading English firms would do well to send out representatives capable of speaking with authority, in order to look up business, not merely in the Transvaal but in other countries. It is not necessary they should all be interviewed.

The War and the Cables.—The *Times* correspondence on the cutting of the cables in war time—which we have already reproduced in the ELECTRICAL REVIEW—is continued by Mr. Charles Bright, as follows:—

With the authority of experience, Mr. Parsoné appears to have been the first to remind the public that more than one cable owned by a company of neutral nationality has been interrupted in the course of warfare. Without desiring to take up your space by a disquisition on the morality, or otherwise, of cutting neutral cables, or on the question of indemnity claimable, perhaps I might remark that, in my opinion, a useful purpose has been served, if only in exemplifying what we may actually expect in the event of our country being at war with another European Power. Surely a consideration of the prospects points, Sir, to the necessity—aye, urgent necessity—of a system of cables connecting the entire British Empire by direct and independent means—*i.e.*, without touching on foreign soil. In the event of a permanent and reliable understanding being arrived at with our American cousins, the United States would not require to be regarded as foreign territory; and if, for certain purposes, a further alliance, including Japan, were agreed to, two Pacific cable schemes might be united in one. Reciprocally, a telegraphic clause would be one of the most important items in any convention constituting an Anglo-American alliance and Customs union, whether Japan be also allied with us for strategic and trade purposes or not. Such a convention would tend to ensure the naval supremacy of the English-speaking world in the Pacific, and would render us independent of the good offices of our European neighbours. It is known that the Americans are taking active steps in the direction of a cable from San Francisco to Japan. If the understanding here referred to were brought about, a comparatively short branch from the above to Australia would also embody every element of the all-British line lately considered by the Colonial Office. My remarks are, of course, rather from the national point of view than from that of a shareholder in existing cable systems. Moreover, they do not apply to the project for an all-British line to the Cape and Australia *viâ* Gibraltar and various important naval stations—an admirable project in itself, so far as it goes. I am glad to think, Sir, that you recognise the entire subject as one of vital importance just now, and I trust that, considering the strained condition of European politics, the matter will be thoroughly gone into.

Mr. T. E. Holland replies to the above letter, also that of Mr. Parsoné, in the following terms:—

Will you allow me to refer in a few words to the interesting letters upon the subject of submarine cables which have been addressed to you by Mr. Parsoné and Mr. Charles Bright? In asserting that "the question as to the legitimacy of cable-cutting is covered by no precedent" I had no intention of denying that belligerent interference with cables had ever occurred. International precedents are made by diplomatic action (or deliberate inaction) with reference to facts, not by those facts themselves. To the best of my belief no case of cable-cutting has ever been made matter of diplomatic representation, and I understand Mr. Parsoné to admit that no claim in respect of damage to cables was presented to the mixed Commission appointed under the Convention of 1883 between Great Britain and Chili.

In the course of his able address upon "Belligerents and Neutrals," reported in your issue of this morning, I observe that Mr. Macdonell suggests that the Institut de Droit International might usefully study the question of cables in time of war. It may, therefore, be well to state that this service has already been rendered. The Institut, at its Paris meeting in 1878, appointed a committee, of which M. Renault was chairman, to consider the whole subject of the protection of cables, both in peace and in war; and at its Brussels meeting, in 1879, carefully discussed the exhaustive report of its committee, and voted certain "conclusions," notably the following:—

"Le câble télégraphique sous-marin qui unit deux territoires neutres est inviolable.

"Il est à désirer, quand les communications télégraphiques doivent cesser par suite de l'état de guerre, que l'on se borne aux mesures strictement nécessaires pour empêcher l'usage du câble, et qu'il soit mis fin à ces mesures, ou que l'on en répare les consequences, aussitôt que le permettra la cessation des hostilités."

It was in no small measure due to the initiative of the Institut that diplomatic conferences were held at Paris, which in 1882 produced a draft convention for the protection of cables, not restricted in its operation to time of peace; and in 1884 the actual convention, which is so restricted.

It may not be generally known that in 1864, before the difficulties of the subject were thoroughly appreciated, a convention was signed, though it never became operative, by which Brazil, Hayti, Italy and Portugal, undertook to recognise the "neutrality" in time of war of a cable to be laid by one Balestrini. So, in 1889, the United States were desirous of concluding a general convention which should assimilate the destruction of cables in the high seas to piracy, and should continue to be in force in time of war. The Brussels conference of 1874 avoided any mention of "câbles sous-marins."

The moral of all that has been written upon this subject is obviously that drawn by Mr. Charles Bright, viz., "the urgent necessity of a system of cables connecting the British Empire by direct and independent means, *i e*, without touching on foreign soil."

A New York telegram says that despatches from Santiago announce that the steamer *Adrian*, convoyed by the gunboat *Dolphin*, succeeded in cutting two of the three cables connecting Cuba with Jamaica and Hayti on Friday last. The cable cutting has been done with the tacit approval of England and France, and no complications are likely to ensue.

Motor Starters.—The *Electrical World* recently said regarding motor starters:—

What is ordinarily known as an automatic motor starter might better be termed a motor stopper, the name really signifying a device by which, when the current is shut off, the full resistance of the starting rheostat is inserted in the circuit. An ideal automatic motor controlling mechanism would consist of a device so arranged that when the main switch is closed on the motor the resistance arm would move gradually from resistance all in to resistance all out, at which position it would remain until the current was turned off or the motor was overloaded, in either of which cases it should again insert full resistance, and in case of overload preferably open the armature circuit. No such device is at present on the market.

Mr. F. E. Herdman, of Milwaukee, Wis., has written to our contemporary on the matter, as follows:—

I built an automatic starter, similar to the one you describe as an ideal starter, over a year ago, and the same has been regularly manufactured and on the market since that time. This starter is operated by simply closing a double-pole knife-switch to the main circuit, this action deflecting a strong spring which operates the rheostat contacts, cutting out the resistance at a speed determined by a pneumatic dash-pot. When the circuit is open, the resistance is automatically thrown into the circuit. The starter is supplied with an under voltage and an overload release, the action of either opening the double-pole knife-switch. The main switch cannot be closed unless the resistance is all in circuit with the motor, and when the knife-switch is closed the resistance will not be cut out of circuit unless the current flows through the motor, and the knife-switch would not stay closed when the hand is taken from it unless such a current existed.

Our contemporary adds that the starter described by Mr. Herdman fulfils the requirements mentioned as some of those of an ideal motor controlling mechanism.

The Heating Capacity of Wood.—An American exchange says that a writer in the *Staats Zeitung* corrects a very common supposition in regard to the heating capacity of wood, the most notable fact in the case being that such a practical and easily demonstrable error should so long have prevailed, namely, that the heating capacity of hard wood is greater than that of soft wood. The fact, as ascertained by repeated determinations, is that the greatest heating power is possessed by one of the softest varieties of such material, viz., the linden. Taking its heating capacity by the unit, the second best heater is also a soft wood—fir, with 0·99 heating power; next follow the elm and pine, with 0·98; willow, chestnut, larch, with 0·97; maple and spruce fir, with 0·96; black poplar, with 0·95; alder and white birch, with 0·94 only; then comes the hard oak, with 0·92; the locust and the white beech, with 0·91; and the red beech, with 0·90. These examples leave no doubt of the general fact that hard wood heats the least.

Röntgen Society.—At the meeting of this society held at 11, Chandos Street, Cavendish Square, W., on Tuesday, 7th inst., papers were read by Mr. T. C. Porter on "Work on the X Rays," and Mr. A. A. Campbell Swinton, on "A Pin-hole Röntgen Ray Camera and Its Applications."

Mr. John Brooke Goodman.—Mr. John Brooke Goodman, a young electrician in the employ of the Electric Traction Company, at the works of the Central London Railway, now in course of construction between the City and Shepherd's Bush, lost his life by a distressing accident on June 1st. He was assistant superintendent of the electric lighting arrangements in the tunnels, &c., and on the day in question he was at the Oxford Circus station, where there is a small installation of two 200-volt, 100-ampere, 800 revolution dynamos, belted to high-speed vertical engines. The belt of the left-hand set had come off and had been replaced, the engine being again started at about quarter speed. Although the precise cause of the accident will never be known, it seems quite certain that when going round to look at the belt while the engineer was altering the tension screws, Mr. Goodman slipped or stumbled, lurched on to the pulley of the dynamo and was then thrown with terrible force against the wooden wall of the shed, rebounding on to the second dynamo with which his head came into such violent contact that his skull was fractured, death resulting within a minute or two. Mr. John Brooke Goodman was the third son of Mr. Edward John Goodman, assistant editor of the *Daily Telegraph*. He was born on December 20th, 1874, and was thus only 23 years of age. He had only been about six weeks in the employ of the Electric Traction Company at the time of the accident. His early death has cut short a very promising career. Industrious, energetic, and well informed in the technical and practical phases of electrical engineering, he would undoubtedly have risen to a high position in his profession.

Another New Element.—Prof. Ramsay, who several years ago, in conjunction with Lord Rayleigh, discovered argon, has succeeded in eliminating from the atmosphere a new gas. This elementary substance, which has been named crypton, or "concealed," is obtained by the evaporation of large quantities of liquid air. The residue is a hitherto unknown gas, transparent, heavier than argon, and, like that element, inactive. Crypton is present in the atmosphere in the proportion of 1 to 20,000 parts. The chief lines of the spectrum are green and yellow, the yellow being nearly coincident with the helium yellow line D 3.

The Paris correspondent of the *Standard* says that at Monday's sitting of the Academy of Sciences, M. Berthelot read a communication relating to the new constituent of atmospheric air, the discovery of which is due to the investigations and experiments of Prof. Ramsay and Mr. Morris W. Travers. These gentlemen lately received from Dr. Hampson 750 cubic centimetres of liquid air, which they reduced by evaporation to 10 cubic centimetres, and collected in a tube the gas furnished by the residue. This gas was deprived of its oxygen by the help of metallic copper, of its nitrogen by the action of the electric spark, and of oxygen after that by a mixture of magnesium and pure lime. This operation effected, there remained 26 cubic centimetres of a gas which presented, besides the weakly-defined spectrum of argon, an additional spectrum till then unknown. It was characterised by two exceedingly brilliant lines, one being almost identical with D 3. The other, green, may be compared in intensity with the green line of helium. Its wave length was 5,566·3. Another slightly weaker gave 5,557·3. The density of the gas was approximately 22·5, that of oxygen being 16. According to the velocity of sound, the ratio of specific calories is 1·666, the same as that of argon and helium. It therefore follows that the new gas is monatomic, and constitutes an element. These facts go to prove that the atmosphere contains a hitherto unknown gas heavier than argon, with a characteristic spectrum, less volatile than nitrogen, oxygen, and argon. Messrs. Ramsay and Travers give crypton as the name for this new gas. The position in the periodical table it is not possible to determine in an absolute manner. They, however, hazard the conjecture that the pure gas has a density of 40, and an atomic weight of 80, and that it may be classed with helium. Those gentlemen are continuing their investigations, and preparing a larger quantity of the gas to that end. M. Berthelot, who received a small supply of the new gas in a Fluckyer tube, has verified the existence of the new lines by means of his spectroscope.

The Parliamentary Electrical Energy Committee.—It is understood, says the *Times*, that the Joint Committee of Lords and Commons upon Electrical Energy (Generating Stations and Supply) have arrived at the conclusion that the proved public advantages of electrical energy in the generation of light and power warrant the granting to undertakers of compulsory powers for acquiring sites for generating stations and lands or easements for pipes and mains therefrom. The Committee recommend that provision be made for the granting of these powers in the provisional orders of the Board of Trade, subject to confirmation by Parliament, it being pointed out that such provision would facilitate a continuance of the existing practice according to which more or less uniform conditions under which undertakers are to work are provisionally settled by the Board of Trade. Procedure by private Bill should, the Committee hold, be reserved, as at present, for exceptional cases. As to the bodies which should be entrusted with these powers, the committee suggest either local authorities or incorporated companies (whether the incorporation be by special Act of Parliament or provisional order, or under the Companies Acts). With respect to liability for nuisance, the committee are of opinion that where the site for a generating station is acquired under compulsory powers, and is specified in the provisional order or special Act, the undertakers should not be subjected to any further liability than that which, according to Lord Blackburn ("Geddis *v.* Bann Reservoir," 3 App. Cas., 455), is imposed by the common law in the case of persons exercising statutory powers and duties. On the other hand, where the site for a generating station is acquired by agreement, they think the undertakers ought to be subject to the liability imposed by the common law. The committee explain that the several Bills now pending in Parliament, in which effect is proposed to be given to new developments of the electrical industry have been brought to their notice, but they have not considered them in detail nor taken any evidence upon them. They have treated them only incidentally as showing the lines upon which the industry is likely to expand. They have laid down the general principles which they suggest should guide Parliament and the Board of Trade, but whether those principles should, in whole or in part, be applied, and whether any, and what, special conditions should be imposed, must of course be decided in each individual case according to its merits. The committee express the view that compulsory powers may properly be given even where the proposed site is not within the area of supply; and in this connection they also agree that the laying of mains should be permitted from the generating station to the boundaries of the area of supply.

Bi-Metallic Wire on the Pennsylvania Railway Telegraph System.—An American exchange says that Mr. A. M. Schoyer, superintendent of telegraph, Pennsylvania lines west of Pittsburg, about a year ago placed bi-metallic wire in service on several of the branch lines of this great railway system in and around Pittsburg, and because of the very satisfactory service which that wire rendered, he has recently introduced bi-metallic wire on the main line of the road between Pittsburg and Columbus, the size of the wire being No. 9 B. & S. gauge. Our contemporary adds that the splendid position of the Pennsylvania system to-day shows conclusively that the utmost care is exercised in conducting all branches of its business, and because of the excellent service which that system renders to the public, it necessarily follows that any material which is used by it receives the stamp of approval of a company which is second to none. In view of this use it can be said that bi-metallic wire is now a standard type of wire for overhead construction.

War Fatalities.—From the New York *Electrical Engineer* we learn with regret that two of the Edison Company's electricians were working down the Bay laying torpedoes off Sandy Hook from a small boat, when they were run down by a French ship and drowned. These are the first war victims in the vicinity of New York. Our contemporary remarks that the sad incident is but a further proof of the active part that electricity is playing in the present war, and that pensions should be awarded to the families of the two men.

Royal Institution.—At last Monday's meeting the special thanks of the members were returned for the following donations to the fund for the promotion of experimental research at low temperatures:—Messrs. G. J. Romanes, £5; Sir Frederick Bramwell, £100; Prof. Dewar, £100; Dr. Ludwig Mond, £200; Charles Hawksley, Esq., £100; Sir David Salomons, Bart., £21; Dr. Rudolph Messel, £100.

The Royal Society.—Among the papers down for reading yesterday was one by Prof. W. Ramsay, F.R.S., and Morris H. Travers, "On a New Constituent of Atmospheric Air," and one by Mr. J. E. Petavel, "On the Heat Dissipated by a Platinum Surface at High Temperatures."

Presentation.—On Tuesday last, the staff of Messrs. Crompton & Co., Limited, entertained Mr. Chamen, Corporation electrical engineer at Glasgow, at dinner at the White Hart Hotel, Chelmsford, and presented him with a gold watch and chain and an illuminated address. Mr. Chamen was, previous to his appointment at Glasgow, engineer-in-chief of Messrs. Crompton's contract department.

Shock Fatality.—On May 19th, a young man in the employ of the United States Electric Lighting Company, at Washington, met his death under circumstances somewhat similar to those attending the victim of the Chelmsford accident. He was attending to the wires at a manhole when he received the full force of the current, and all efforts to restore him to consciousness were of no avail. The deceased was one of the best workmen the company had and was a thoroughly experienced hand. The affair was purely an accident, for deceased had given instructions for the current to be switched on to the cables from the station, but it was on sooner than he anticipated, he not having finished making the connection.

Technical Education.—The Kingston-on-Thames Technical Education Committee (under the Surrey County Council) has decided to hold a class for electric lighting during next winter, the pupils to receive object lessons at the Corporation's electric lighting works, established two years ago.

"Submarine Telegraphs."—The Queen has been pleased to accept a copy of the recent work on "Submarine Telegraphs," by Mr. Charles Bright, F.R.S.E., and of the *brochure* entitled "Science and Engineering during the Victorian Era," by the same author.

Personal.—We are glad to be able to announce that Mr. H. Hirst is rapidly recovering from the effects of the operation recently performed on him, and that he hopes soon to get up from his sick couch.

On Tuesday the Londonderry Corporation appointed Mr. Robert Valentine Macrory (late of Messrs. Siemens Bros. and Co.) to the position of Electrical Engineer for the City. There were 51 candidates.

NEW COMPANIES REGISTERED.

Limerick Electric Tramway Company, Limited (2,238).—Registered in Dublin May 2nd, with capital £2,000 in £1 shares, to equip and to maintain and work by electricity, steam, horse, or other mechanical power, all tramways belonging to the company, or in which the company may be interested, and to carry on the business of tramway, railway, omnibus, and van proprietors, &c. The subscribers are:—W. H. Wilson, 37 College Green, Dublin, stockbroker, one share; N. McGarvie, 19, Killeen Road, Rathmines, Dublin, stockbroker's clerk, one share; J. A Wilson, 37, College Green, Dublin, stockbroker, one share; W. Butler, 47, Goldsmith Street, Dublin, accountant, one share; J. Chambre, Commercial Buildings, Dublin, merchant, one share; H. F. Fuller, 8, Wellington Road, Dublin, M.Inst.C.E., five shares; G. W. Fitzgerald, 65, Haddington Road, Dublin, civil engineer, one share. The number of directors is not to be less than two nor more than seven. The subscribers are to appoint the first. Qualification, £50; remuneration as fixed by the company. Registered by T. W. Hardman & Sons, 14, Molesworth Street, Dublin. Registered office, 22, Mason Street, Dublin.

T. F. Braime & Co., Ltd. (57,524).—Registered May 26th, with capital £20,000 in £1 shares, to acquire the business carried on by T. F. Braime at the Northern Works, St. Helen's Street, Hunslet, Leeds, and to carry on the business of mechanical, electrical, and general engineers, stampers, pressers, piercers, brass founders and finishers, tinners, coppersmiths, &c. The subscribers (with one share each) are:—T. F. Braime, 148, Chapeltown Road, Leeds, engineer; Mrs. L. Braime, 148, Chapeltown Road, Leeds; J. H. Braime, Elm Cottages, Rothwell, near Leeds, engineer; Mrs. M. Braime, Elm Cottages, Rothwell, near Leeds; Miss M. E. Braime, Elm Cottages, Rothwell, near Leeds; G. Crowther, The Ridge, Bingley, chartered accountant; A. W. Waide, Methley, Leeds, farmer. The number of directors is not to be less than two nor more than five; the first are T. F. Braime, J. H. Braime, and A. W. Waide. Qualification, £200. Remuneration as fixed by the company. Registered by Waterlow Bros. & Layton, Ltd., Birchin Lane, E.C.

Redditch District Electric Traction Company, Limited (57,527).—Registered May 26th, with capital £2,000 in £10 shares, to promote and obtain the necessary authority to make and maintain light railways and tramways in the counties of Worcester and Warwick, or elsewhere, to make and maintain any such light railways and tramways, and to supply electric light, heat and motive power. The subscribers (with one share each) are:—E. Horton, The Grange, Prescot, near Walsall, manufacturer; J. J. Gittings, Glenthorn, Birchfield, Birmingham, manufacturer; W. J. Kershaw, 34, Waterloo Street, Birmingham, chartered accountant; H. P. Butt, 73, Thornhill Road, Handsworth, clerk; R. P. Dodd, 48, Kingscote Road, Edgbaston, Birmingham, civil engineer; R. Green, Silvermere, Clarence Road, King's Heath, civil engineer; C. H. Hales, 138, Oldfield Road, Balsall Heath, clerk. Table "A" mainly applies. Registered office, 37, Waterloo Street, Birmingham.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Metropolitan Electric Supply Company, Limited (25,395).—This company's annual return was filed on April 27th, when 62,400 ordinary and 100 founders' shares were taken up out of a capital of £1,000,000 in £10 shares. 2,032 are considered as paid, and £10 per share has been called and paid on the remaining 60,468 shares.

Bournemouth and Poole Electricity Supply Company, Limited (55,189).—This company's statutory return was filed on May 20th. The capital is £150,000 in £10 shares (7,500 preference). 6,000 of each class have been taken up, £10 per share has been called, £119,680 has been paid, and £320 is in arrears.

Oldham, Ashton, and Hyde Electric Tramway, Limited (55,318).—This company's statutory return was filed on April 27th. The whole capital of £80,000 in £10 shares (4,000 preference), has been taken up, and £4 per share has been called. £31,230 has been paid, £770 is in arrears, and £120 has been received in advance of calls.

County of London and Brush Provincial Electric Lighting Company, Limited (34,320).—This company's annual return was filed on May 20th. The capital is £800,000 in £10 shares (40,000 preference). 40,000 ordinary and 20,000 preference have been taken up. £10 per share has been called on 30,000 ordinary and 20,000 preference, and £2 per share has been called on 10,000 ordinary. £519,880 (including £40 in advance of calls) has been paid, and £160 is in arrears.

Willans & Robinson, Limited (40,660).—This company's annual return was filed on April 22nd. The capital of £300,000 in £5 shares (30,000 preference) has been taken up, and 14,463 preference and 14,462 ordinary are considered as paid; £5 per share has been called on 12,537 preference and 12,538 ordinary, and £1 per share has been called on 3,000 preference and 2,997 ordinary; £131,372 has been paid, and £3 is in arrears.

Electric Street Car Manufacturing Syndicate, Limited (55,080).—This company's statutory return was filed on April 22nd. The capital is £25,000 in £1 shares, of which 7,130 have been taken up. 10s. per share has been called, and £3,552 10s. has been paid, leaving £12 10s in arrears.

CITY NOTES.

Great Northern and City Railway Company.

This week the prospectus of this company has been before the public, inviting applications for £780,000 in 4 per cent. preferred ordinary "A" £10 shares at par, and £780,000 5 per cent. deferred ordinary "B" £10 shares at par. Interest at 3 per cent. per annum will be paid half-yearly on May 1st and November 1st, during construction, on both "A" and "B" shares, as authorised by Parliament, on amount paid up from time to time. The contractors, Messrs. S. Pearson & Son, Limited, guarantee the payment of a minimum interest of 4 per cent. per annum on the "A" shares, and of 3 per cent. per annum on the "B" shares during the period they work the railway, not exceeding three years after opening of the line.

The directors are Sir Charles Scotter, chairman, Sir Allen Sarle, the Earl of Lauderdale, Colonel R. Williams, M.P., Sir Francis Knollys, K.C.M.G., K.C.B. Sir Douglas Fox and Mr. Francis Fox are engineers. Secretary, Mr. H. Barrow Doo, 18, Eldon Street, Finsbury, E.C.

The Great Northern and City Railway (about three miles in length), in direct connection with the Great Northern Railway, will afford a short through communication between Finsbury Park station, where the various suburban lines of the Great Northern Railway Company converge, and Moorgate Street, in the City of London. This railway, with three intermediate stations at Drayton Park, Essex Road, and Old Street, will provide a frequent and convenient railway service for the densely populated district through which the railway will pass, and will thus fulfil the double purpose of serving a large local traffic, and of furnishing the Great Northern Railway system with a City terminus for its rapidly growing suburban traffic. The motive power will be electricity; but this railway will differ from other electric railways, in that both tunnels will be 16 feet in diameter, and will take the Great Northern Railway Company's heaviest suburban trains, consisting of 11 vehicles, with a seating capacity of 500 passengers. The journey will occupy 12 minutes.

The directors estimate the minimum annual revenue as follows:—

Local traffic:—	
At the low estimate of 10,500,000 passengers, which is less than 4,000,000 passengers per mile, at an average of only 2d. per passenger	£87,500
Local season-ticket holders, 10 per cent. of local receipts	8,750
Through traffic:—	
Assumed for first three years' working at only 25 per cent. above the Great Northern Company's guaranteed minimum	25,000
Sundry receipts:—	
Interest payable by Great Northern Railway Company, parcels, rents, advertisements, &c.	5,000
	£126,250
Less working expenses, say, 40 per cent., on local traffic, and 25 per cent. on the Great Northern through traffic	44,750
Net revenue	£81,500

The prospectus says that recent improvements in electric working prove that 40 per cent. is a liberal allowance for working expenses.

To pay interest at 4 per cent. on debenture stock of £520,000, and on preferred ordinary shares of £780,000, a net revenue will be required of £52,000.

The local traffic is calculated on a daily service of only 125 trains each way, upon which the carrying capacity will be equal to nearly four times the number of passengers assumed.

It is mentioned that the Metropolitan Railway runs daily through King's Cross 265 trains each way, the Metropolitan District 278 trains each way through Victoria, and the South London Electric Railway 220 trains each way for its purely local traffic.

The company has entered into a contract for the amount of the share and debenture capital of the company with Messrs. S. Pearson and Son, Limited, of Westminster, the well-known contractors, for the construction and equipment of the railway and works, in accordance with the Company's Acts, including land, buildings, rolling stock, electrical installation, motors, &c., with all Parliamentary, legal, engineering, administration, and other liabilities and expenses whatsoever during construction, including the payment of interest. The contractors assume all risks of compensation and damage by tunnelling or otherwise, and the company will enter upon a completed line, fully equipped with rolling stock, and in working order. Messrs. Pearson have entered into an agreement to work the railway for a period of three years after completion, the directors reserving to themselves the right to take over the working at any time at one month's notice.

The list opened on Tuesday and closed on Thursday.

London Electric Supply Corporation.

An extraordinary general meeting of this corporation was held on Tuesday at the City Terminus Hotel for the purpose of considering and, if thought fit, passing the following resolution: "That the capital of the company be reduced from £1,250,000, divided into 200,000 ordinary shares of £5 each and 50,000 preference shares of £5 each, to £850,000, divided into 200,000 ordinary shares of £3 each, and 50,000 preference shares of £5 each, and that such reduction be effected by cancelling capital which has been lost, or is unrepresented by available assets to the extent of £2 per share on each of the 111,000 ordinary shares which have been issued and are now outstanding, and by reducing the nominal amount of all the said ordinary shares from £5 to £3 each."

Lord Wantage, who was voted to the chair, said there had been a small but increasing profit every year since the date of the receiver's appointment. The working for the year 1897 showed a profit of £16,586, being more than double that of 1896. Their lamp connections showed a corresponding increase, for whereas in 1896 the numbers were 106,474, in 1897 they had increased to 123,730, or 17,256 increase for the year—a rate of progress equal to nearly 20 per cent. This favourable condition had been reflected in the value of the company's shares. It was 12 months since he last addressed the shareholders, and on that occasion they asked him to carry on the business for another year. He thought the shareholders would agree with him that the time had now arrived when the receiver should retire, and that the company should resume the possession after a break of four years. It was owing to the careful, economical, and skilful management of the receiver that the company had been saved, and was now in a prosperous condition. It was proposed that the whole board of directors should retire, leaving it in the hands of the shareholders to appoint a new board. Though it was not proposed to make any large changes in the constitution of the company, so far as the number of directors was concerned, he thought it was desirable that they should not fill up all the vacancies on the board at once, in case it might be found convenient to bring in other persons who would assist in the development of the business. He considered they should only elect four directors. The chairman then read a long report made by Mr. Bain, the receiver, on the affairs of the company. He concluded by moving the adoption of the resolution, which was seconded by Mr. Pyke, and unanimously agreed to.

A further resolution was afterwards passed altering the articles of association in order to conform with the requirements of the Stock Exchange with a view to obtaining a quotation for the company's stocks.

The following were then elected to act as the board of directors:—Lord Wantage, the Earl of Crawford, and Mr. R. S. Bain.

The Western and Brazilian Telegraph Company, Limited.

The report of the directors to be presented at the thirty-fifth ordinary general meeting of the company, held on Thursday, June 9th, at Winchester House, states that the total earnings amount to £72,332 9s. 10d., as against £71,315 12s. 2d., showing an increase of £1,016 17s. 8d. compared with the half-year to December 31st, 1896. The working expenses amount to £37,774 1s. 11d, as against £38,160 19s. 4d., a decrease of £386 17s. 5d. Including the amount brought forward from June 30th, 1897 (£3,867 15s. 2d.), and the dividend received upon the shares held in the "Platino" Company, the balance to the credit of the revenue account is £49,520 3s. 1d., from which has been deducted £8,060 8s. 4d. for interest on debentures and debenture stock, £2,159 12s. 4d. has been invested on account of the debenture stock redemption fund, and £5,000 placed to reserve fund, leaving a balance of £34,300 2s. 5d. The directors now recommend the payment of 6s. 9d. per share, free of income-tax, for the half-year on the ordinary shares, making, with the dividend paid in November last, £3 5s. per cent. for the year, leaving a balance of £1,428 5s. 11d. to be carried forward. In the case of shares which have been divided into "preferred" and "deferred," the 6s. 9d. per share now recommended will be payable, viz: 6s. to the "preferred" shareholders (making up the full dividend of £5 per cent. on these shares to December 31st, 1897), and 9d. per share to the deferred shareholders. The loss on exchange during the half-year has been diminished owing to the additional collection on international traffic which came into force on July 1st, but the rate of exchange has still fallen. The receipts of the current half-year show a considerable improvement upon those for the corresponding period of 1897. Negotiations for closer working between this company and the Brazilian Submarine Telegraph Company, Limited, have been in progress, and an agreement will shortly be submitted to you. The ninth annual drawing of the "A" and "B" debentures took place at the company's offices on January 17th last, in the presence of Mr. H. de Meray, notary public, when debentures amounting to £18,000 were drawn; of these £8,000 "A" and £9,300 "B" had already been exchanged for debenture stock and the balance, viz, £700 "B" debentures have since been paid off at par. The dividend warrants will be posted on June 9th, 1898. The retiring directors are Mr. W. S. Andrews and Lord Richard H. Browne, who offer themselves for re-election. The directors report, with much regret, the death of their late colleague, Major Wood.

The auditors, Messrs. Turquand, Youngs, Bishop and Clarke, retire, and are eligible for re-election.

The general meeting of this company was held at Winchester House yesterday, Mr. W. S. Andrews presiding. The negotiations for closer working between this company and the Brazilian Submarine Company are not yet completed. They are progressing satisfactorily and pretty actively, and, it is believed, will result successfully, the results being welcome to the Governments and the public and the companies. Of course, nowadays, it was necessary to do things which were agreeable all round. He asked them not to put any questions to him regarding the subject. The report was adopted We shall print a longer report of the meeting next week.

The Metropolitan Electric Supply Company, Limited.

The following circular has been issued:—

Sir or Madam,—You will receive herewith a notice of an extraordinary general meeting, which has been summoned to consider a scheme with reference to the alteration of the founders' shares, and the practical consolidation thereof with the ordinary shares of the company, and also, if thought fit, of passing a resolution approving an agreement, a draft of which will be submitted to the meeting, whereby the founders' shareholders will have their founders' shares converted into ordinary shares, and in consideration of so doing, will have an option of subscribing for 225 ordinary shares at par for each founders' share held by them.

Though your directors are prepared to advise the adoption of this scheme, and the passing of the said resolution, they recognise that the shareholders may wish for some explanation why the board are now prepared to recommend a settlement more in favour of the founders' shareholders than that originally offered by the board, and which was referred to by the chairman at the annual general meeting.

The board appreciate that the compensation contemplated by the proposed agreement appears a large one, but they believe it will be warranted by the advantages which will accrue to the whole body of shareholders by the surrender of the special rights attaching to the founders' shares.

At the annual meeting the shareholders expressed their unanimous approval of the policy of the board in purchasing a freehold site at Willesden, and the erection thereon of a large generating station. These works involve an early issue of capital, but as to the terms of such an issue the interests of the holders of the founders' shares and of the ordinary shareholders in the company are directly divergent.

Another, and perhaps a more cogent reason, exists in the necessity of creating a strong reserve fund, in doing which the directors are hampered both by express prohibitions introduced into the articles in the interests of the founders' shares, and also by the consideration that if those reserve funds were formed out of profits, which would otherwise be divisible amongst the holders of ordinary shares, they might, when formed, be claimed as to one-half by the holders of the founders' shares.

It seemed impossible, in the face of these difficulties, to avoid a litigation, which would certainly have caused the company much embarrassment, by delaying the issue of the new capital.

It was, moreover, apparent that a similar opportunity of extinguishing the rights of the founders' shares would, in all probability, never occur again, and the directors felt bound by the repeated pledges given to the ordinary shareholders, to spare no effort in getting rid of the founders' shares, and placing all the shareholders of the company on an equal footing.

The extraordinary general meeting called to consider the above question was held at Winchester House on Tuesday last, Sir Eyre Massey Shaw in the chair.

The Chairman said the circular fully explained the reasons for the meeting. When he met them last there appeared to be no possibility of coming to terms with the holders of the founders' shares. The founders were determined to contest the right of the company to issue new capital. The chairman went on to remark that compromise was the only possible basis of settlement, and by consolidating all their interests they would be able to build up a reserve. The business of the company was never in a sounder position than at the present time, notwithstanding considerable reductions in the price which had taken place at the beginning of the present year, from 7½d. to 6d. per unit. The increase in the revenue for the quarter showed a most satisfactory increase over that of 1897. The returns that morning showed 63,000 lamps connected for the 12 months against 43,000 for the preceding period. There were 394,000 lamps connected, and applications for 13,000. In spite of competition, therefore, from local authorities, they had every reason to believe in the progress of the company.

After the solicitor had explained the exact position of the founders' shares, and sundry questions had been raised and answered, the following resolutions were put to the meeting and carried:—

"That it is expedient that the special rights and privileges of the 100 founders' shares in this company, whether with regard to dividend, capital, reserve fund or otherwise, should cease and be abolished upon the terms that each registered holder of a founders' share or founders' shares in the company should, upon having such share or shares converted into one ordinary share or shares, have the option of subscribing for 225 ordinary shares in the company at par in respect of each founders' share so held by him, and that the draft agreement for the purpose submitted to this meeting be and the same is hereby approved."

"And the directors of this company be, and they are hereby authorised to adopt the said agreement, and to affix the seal of this company thereto, with full power to assent to any modifications in the agreement which they think expedient in the interests of this company, either before or after the adoption thereof."

A vote of thanks to the chairman then concluded the proceedings.

Brazilian Submarine Telegraph Company, Limited.

The forty-ninth ordinary general meeting of the shareholders of the above company was held on Wednesday at Winchester House, Old Broad Street, Mr. J. Denison Pender presiding.

The Chairman, in proposing the adoption of the report, said the first thing that devolved upon him was to refer with regret to the death of a colleague. Since they last met they had lost Lord Sackville Cecil. His training as a young man enabled him to acquire a knowledge of electrical business which was of considerable value to the company, and his death was therefore a great loss to them. When one unfortunately fell out, it was, of course, the duty of the directors to find a successor, and he was glad to say that in the present instance they had been able to secure the services of Sir John Wolfe Barry, K.C.B., as a member of the board. Although Sir John Barry might not be known to them personally, those who had watched the great engineering feats that had been carried out of late years must know his name perfectly well. He thought, therefore, they were to be congratulated upon having obtained the consent of Sir John Barry to act as a director. He would now draw their attention to a few points in the report. With regard to the accounts, the income for the half-year ending December 30th, 1897, amounted to £100,300; for the previous half-year it was £79,133, which showed an increase for the last half-year of £21,000. Of that increase £20,000 was due to increased message receipts and small sums of £62 and £250 respectively for interest and transfer fees, and dividends from other telegraph companies. The increase in the message receipts was satisfactory, and arose first from their having carried a larger amount of traffic than in the previous half-year—the increase being 97,000 words of ordinary commercial traffic and 18,000 words of press messages, which, as they knew, was carried at a considerably reduced rate. A considerable portion of that increased traffic was, he hoped, taken from competitive lines on account of the satisfactory working of their system. The second factor that had led to their increased receipts was the reduced loss on exchange upon the traffic receipts collected in Brazil, resulting from the provisions agreed upon at the International Conference in 1896, at which their company was represented. Those provisions which were now being carried out by the Brazilian telegraph department and by the telegraph companies, came into operation on July 1st last, and consequently its beneficial effect was apparent for the first time in the accounts which were now under review. Unfortunately, the fall in the gold value of the milreis had continued. Between July and December, 1897, it was fairly steady at an advance of about 7½, but in the current half-year it had fallen to a little less than 6d. It had of late, however, shown a rising tendency, which he hoped would continue to the advantage of the Brazilian Government and of themselves. If they compared the receipts of the past half-year with the corresponding period of 1896, they found an increase of £11,327—a much smaller sum than the £21,000 which he had just mentioned as the excess over the previous half-year. Turning to the expenditure side of the account, they found that the total expenditure for the half-year was £26,000 odd, and that for the previous six months was £20,500. That showed an increase of £5,661, which was fully accounted for by the fact that whilst in the June half of 1897 there was no expenditure upon repairs to cables, in the December half nearly £6,000 was spent under that head. He had before called their attention to the item of cable repairs, and asked them, in examining the accounts, not to take too much notice of any diminution under that head, because the experience was, that sooner or later heavy repairs had to be carried out. If they saved them in one year they came in another, and therefore, although they were to be congratulated on getting through a half-year without any heavy expenditure, if they took the average, that expense came out at a pretty considerable amount. So far, however, they had been exceptionally fortunate in that respect. There were increases and decreases of expense under a number of heads of which he would not trouble them with the particulars, but the net results were an increase of £36 in London and £234 at stations, together making £270, which he thought they would look upon as very satisfactory. Even against that small increase there was a decrease of £235 under certain heads, so that there was an actual decrease on the total. After payment of £3,200 for the debenture interest and sinking fund, and providing for the payments of income-tax, there was a credit balance on the half-year's business of £69,580, to which had to be added £7,221, the balance brought forward from June 30th, making together £76,801. The usual interim dividend for the September and December quarters, amounting together to £39,000, had been paid; £25,000 had been transferred to reserve, and £8,662 had been carried forward. Before arriving at that final figure there was deducted a special item of expenditure, quite apart from the ordinary expenses of the half-year. Last year, as they were all aware, the Diamond Jubilee of the Queen was celebrated, and to mark such an unique event many companies gave a bonus to their staff. The directors of the associated telegraph companies considered the matter, and decided to give a bonus to their staffs, and that was carried out on a principle jointly agreed upon all round. In their case the bonus also marked the twenty-fifth anniversary of the existence of the company, and he felt sure that every shareholder had reason to be satisfied with his investment, at whatever period of the company's existence he became interested in it. That consideration for their staff had been fully appreciated by those who served them at home and those who were abroad. He hoped they had still got with them many original shareholders, as he was pleased to say they had officers, who entered the service when the company was formed, and when submarine telegraphy was in a very different position to that which it held to-day as a public investment. They had had the defect in the No. 1 Lisbon cable mentioned to them at past meetings. That defect still existed, but as the cable was carrying the traffic in a satisfactory manner the directors had left well alone, and had not undertaken the removal of the fault, which, however, was in deep water, and which, when it did break down, would be a rather costly, and long business to put right again. He thought he had touched upon all the salient points, but it was rather hard to find anything new to say, seeing that they met half-year after half-year, and received their dividends and bonus regularly every three months. Not only were they receiving a really substantial return upon their investment, but funds were being put to reserve to insure their capital, and therefore there was very little more to be wished for. There was one paragraph in the report to which, perhaps, they would expect him to refer. The directors said:—"Negotiations for closer working with the Western and Brazilian Telegraph Company, Limited, have been in progress, and an agreement will shortly be submitted to you." He begged that the shareholders would not ask him to answer any questions on that subject, because the negotiations were not quite concluded at the present time, and when they were concluded they would all be called together to consider what he believed would be an agreement beneficial to the shareholders of that company and beneficial to the general public, and therefore certainly beneficial to the two countries by which those cables were connected.

Mr. F. J. Hamley said he noticed that £25,000 had been again added to the reserve fund, and he would like to know when the directors would consider that fund sufficiently large.

The Chairman said that, as a large shareholder, he would very much like to have an increased dividend, but the directors not only wanted to give a regular dividend every three months, but also to make the shares of the company one of the best securities going, and they could not do that without insuring their capital. That was the reason they were going on increasing the reserve fund.

Mr. F. Youle seconded the motion for the adoption of the report, and it was carried.

A vote of thanks to the chairman and directors and the staff concluded the proceedings.

Harrow Electric Light and Power Company, Limited.

The report of this company presented to the general meeting on May 24th says, that during 1897, 1,540 8-C.P. lamps were added to the mains, making a total of 5,440 lamps with 87 customers. It had been necessary to practically double the size of the station and provide more plant. The station is now equal to a supply of 9,000 lamps, and further plant can easily be put in. In 1897 50,109 units were consumed. The balance to credit of revenue was £513. This has been devoted to interest on debentures, mortgages, and loans, writing off preliminary expenses, &c. New capital (£20,000) has been issued.

The Electric and General Investment Company, Limited.—Subject to the completion of the audit, the directors have decided to recommend to the shareholders the payment of a further dividend upon the capital paid up on the ordinary shares at the rate of 30 per cent. per annum for the six months ended May 31st last, together with a bonus of 10 per cent., making, with the interim dividend of 10 per cent. already paid, a total dividend of 35 per cent. for the year, and also to recommend a dividend of £50 on each founders' share for the year. The trustees for the founders' shares reserve fund propose to distribute to the holders of such shares a sum of £20 per share out of the proceeds of investments sold and dividends received in respect of the founders' reserve fund, making, with the before-mentioned dividend, a total distribution of £70 on each founders' share. The dividends, &c., to be payable on June 28th, 1898.

Callender's Cable and Construction Company.—The accounts for 1897 show a credit balance of £24,746. It is proposed to pay a dividend for the year of 10s. per share, with a bonus of 2s. 6d., being 12½ per cent. The sum of £3 000 is appropriated for depreciation of machinery and plant, and £5,196 is carried forward.

The transfer books and register of members of the above company are closed from 8th inst. until 16th inst. inclusive.

Stock Exchange Notices.—The Stock Exchange Committee have ordered to be quoted in the Official List:—Eastern Telegraph Company, Limited—Further issue of £129,653 4 per cent. mortgage debenture stock. The Stock Exchange Committee has appointed a special settling day as under:—Tuesday, June 28th: Cape Electric Tramways, Limited—114,843 additional vendors' £1 shares, fully paid, Nos. 285,158 to 400,000.

Royal Electric Company of Montreal.—Messrs. Coates, Son & Co., have been advised that the directors of this company have declared a dividend on the share capital for the quarter ended May 31st of 2 per cent., being at the rate of 8 per cent. per annum, and that the same will be payable on and after July 2nd.

Commercial Cable Company.—The directors have declared a quarterly dividend of 1¾ per cent. on the capital stock, payable on July 1st.

TRAFFIC RECEIPTS.

The Bristol Tramways and Carriage Company, Limited.—The receipts for the week ending June 3rd, 1898, were £3,717 3s.; corresponding period, 1897, £2,461 14s. 7d.; increase, £1,255 8s. 5d.

The City and South London Railway Company.—The receipts for the week ending June 5th, 1898, were £949; week ending June 6th, 1897, £945; increase, £4; total receipts for half-year, 1898, £23,627; corresponding period, 1897, £23,335; increase, £292.

The Dover Corporation Electric Tramways.—The receipts for the week ending June 4th, 1898, were £184 10s. 10d.; total receipts to June 4th, 1898, £2,541 11s. 1d.

The Dublin Southern District (Electric) Tramways Company.—The receipts for week ending Friday, June 3rd, 1898, were £817 1s. 8d.; corresponding week last year, £578 6s.; increase, £238 15s. 8d.; passengers carried, 113,193; corresponding week last year, 87,882; aggregate to date, £10,315 4s. 10d.; aggregate to date last year, £10,627 17s. 7d.; decrease to date, £312 12s. 9d.; mileage open, 8 miles.

The Liverpool Overhead Railway Company.—The receipts for the week ending June 5th, 1898, amounted to £1,869; corresponding week last year, £1,324; increase, £545. 1898 includes Whit Monday, 1897 includes Whit Sunday.

The Western and Brazilian Telegraph Company, Limited.—The receipts for the week ending June 3rd, 1898, after deducting 17 per cent. of the gross receipts payable to the London Platino-Brazilian Telegraph Company, Limited, were £3,066.

THE TELEPHONE INQUIRY.

(*Continued from page* 722.)

The Select Committee of the House of Commons appointed to consider the desirability of giving greater facilities to municipalities in connection with telephonic development sat again on Tuesday last, under the chairmanship of Mr. Hanbury.

Mr. J. C. Lamb, C.B., second secretary at the Post Office, said that at the last sitting of the Committee they referred to the signing of the heads of agreement between the Post Office and the National Telephone Company in August, 1892. The full agreement was not signed till March, 1896. Two years were occupied in endeavouring to give effect to the policy of Her Majesty's late Government, and that involved laborious negotiations, which more than once threatened to break down. They had to find a solution of many difficulties. One was the question of the price to be paid for the trunk wires. The price was to be the sum shown by the company's books. Generally, the heads of the agreement said the price to be paid was to be the cost price, as shown by the company's books plus 10 per cent., but when they came to investigate the matter they found the cost price was not shown in the company's books, and therefore they had to come to an arrangement with them as to the method in which the value of the wires was to be ascertained. It was mutually agreed that two engineer experts should be appointed, one by the company, and one by the Post Office, to ascertain the estimated cost price. Another difficulty arose in connection with the areas, and it was only after long negotiation that any understanding could be arrived at; the company wished to work the trunk wires themselves, because they saw it would necessitate extra points of switching. When the Government would not agree to that, the company suggested that one end of the trunk wire should be worked from the company's exchange and the other end from a post office. That was also rejected, and then a plan had to be devised to reduce the difficulty of additional points of switching, and that took a very considerable time. Another question arose with regard to the number of wires to be erected between the exchanges of the company and the Post Office. They also had to come to an agreement with respect to poles. A great difficulty was that the company was not willing to enter into the question. They felt it was a thing they were urged by Government to enter into. They felt that in parting with the trunk wires they were parting with that part of their system which afforded very great protection against competition.

The Chairman: Did the full agreement of 1896 differ in any respect from the heads of the agreement?—It did not differ in principle.

Witness proceeded to deal with the question of the charges for the use of the trunk wires, which were those now in existence. At present they had no express messengers at the post offices to carry telephonic messages except in some parts of London.

The Chairman: The effect of the present arrangement is to play into the hands of the National Telephone Company?—No; it is not the law of the Medes and Persians. The present arrangement is simply arrived at as the result of a real consideration of what the public demands are.

Is it not a fact that under the present arrangement a telephonic message can only be sent to a subscriber of the National Telephone Company in Glasgow?—No.

To whom can it be sent?—It can be sent in the same way as it is frequently sent to Paris. That is, the correspondent at the other end attends the call office and receives the message.

But how does he know when to attend?—There are arrangements made for the regular attendance every morning of people who have business to do.

Are there the same arrangements in Glasgow?—I do not know; but it would be possible.

Mr. Cohen pointed out that that would not cover the point put forward by the chairman. How would a person not expecting a message know a message was being sent?

Witness said it was a usual thing for a telegram to be sent asking the person to attend at the call office.

The Chairman: Not a very business-like arrangement.

Witness said it was the custom. He considered there was no demand for the express messengers to carry telephonic messages. If there was a demand he would like to know where it was.

The Chairman: Do you see any difficulty in extending the system of telephonic communication by express messengers apart from the effect it would have on the telegraphic revenue?—I do not think there are any other difficulties.

Continuing, Witness said the trunk system had gone on extending since 1896. Thirty extensions had been carried out or were being carried out under guarantee by the company. The miles of wires purchased for the company were 29,000. The miles of wires constructed were 24,526. The mileage in course of construction at the present time was 4,647 miles. The mileage guaranteed was comparatively small. With regard to the areas of the company, the principles adopted in making them were as follows:—(1) Industrial areas of wide extent should be recognised in cases where there are any considerable towns forming centres of business. (2) That neighbouring towns intimately connected with one another in business relations should be included in the same areas; and (3) That small towns and villages in any one of which it would be hopeless to establish a local exchange system unless there was some cheap means of communication with each other, should be grouped together in one area. All urban districts were areas in themselves. Pretty well the whole of the country was divided into areas in which the National Telephone Company had the power to establish an exchange without further license. The company was under no obligation to start an exchange, but the Post Office could grant a license to any other body to start an exchange. Since the agreement was signed in 1896 in only one case had the monopoly of the telephone company been broken down, viz., in Guernsey. The charges there were low, but he did not know that they were lower than the company was prepared to supply the service at. Changes had been made in the areas from time to time, the tendency having been to rather increase the area. The largest area was the London area. Before the company was confined to areas, they had to a large extent arranged themselves in areas, and the London area was in existence. The area was not nearly so big as in some places abroad. There was no limit on the discretion of the Post Office as to laying trunk wires. The only effect a large area had was to reduce the use of short trunk wires. In a number of those areas they had Post Office exchanges competing with the National Telephone Company's exchanges. The principal exchange was at Newcastle-on-Tyne, where they had 626 subscribers. The number of subscribers to the National Telephone system in Newcastle-on-Tyne was much larger. The charges of the Post Office were: For business houses, £8 within half a mile of the exchange, £9 within three-quarters of a mile, and £10 within a mile. He believed the charge of the company was a uniform one of £10. Previous, however, to October of last year the Post Office charged £10 for half a mile, £12 for three-quarters of a mile, and £14 for a mile. The Post Office charges were based on what was supposed to bring in a profit to the tax payer. They were not allowed to canvass, and were not allowed to give preference to firms. The company gave preference, but he did not consider it was the business of the Post Office to complain. He could not say to what extent the preferences had been given by the company. The reduction in the price at Newcastle was bringing them an increase in the number of subscribers. They had offered to put their subscribers at Newcastle in communication with the subscribers of the company, but the company were not willing that that should be done. The Post Office had no legal power to insist upon such a connection.

Questioned by Mr. Stuart, Witness said it would not be possible for the Post Office to lay a trunk line of a few yards in Newcastle and so join their system to the National Telephone system. A trunk line was defined as a line used to connect one area with another.

The Chairman: Do you know any towns where there is competition in which the price charged is lower than where there is no competition?—I do not think that is so.

You do not think competition has had any effect upon their prices?—I cannot tell what effect it has, but as a matter of fact the company's charges are higher in Newcastle than in other towns, probably because they are smaller towns.

Mr. Cohen: Is it not a fact that their prices are based on your charges?—I think that is so.

The Chairman: You have been in unequal competition owing to higher rates?—Yes.

Without disclosing secrets could you tell the committee whether you have made any loss?—No.

And we may say you have made a fair profit?—Yes.

Although there are two competing systems?—Yes.

Are the charges of the company higher in Cardiff and Swansea?—For certain distances I think they are.

Questioned by Mr. Bartley, Witness said the company considered it their duty to fall in with the policy of the Government when the heads of agreement were drawn up, and he did not wish the impression to go forth that they purposely put difficulties in the way.

As regards sending Post Office messengers in London and not in other parts of the country, who authorised that arrangement?—The idea was to give a local service, and it was set forth in a Treasury minute. The whole service was contemplated as a local service, and the question of doing it between one town and another was not in the minds of those who did it.

How does it differ from sending from one town to another?—The impression I suppose was that the telegraph was sufficient to meet that.

Mr. Cawley: Is it in the interest of the public that the National Telephone Company should not have the competition of the Post Office?—I find it very difficult to answer that question. My opinion is that it is very undesirable for a private company to have a monopoly. On the other hand, I am firmly convinced that the establishment in one town of competing systems of telephones would not be in the interests of the public. My opinion is that the whole thing should be in the hands of the Post Office.

Sir J. Woodhouse: You agree there is no obligation imposed by the Post Office, either in the original license or by any agreement with the Telephone Company that they should supply the company with the facilities for which they are licensed?—Yes.

Therefore in two respects; first, no obligation to supply, and secondly, no restriction as to the charges to be made, it does not differ from any other monopoly granted?—The whole arrangement differs.

But don't you agree that it has been very much to the disadvantage of the public?—I think it has been.

Did I understand you to say with regard to the agreement of 1892, that Sir James Ferguson took one line of action, and the Government another?—No.

Do you mean that the Department would have taken one action and Sir James Ferguson another?—No. What I mean is that Sir James Ferguson was requested by the Government to carry out a certain line of policy, and he did so.

What was the difference?—The policy of the Department was to purchase the whole of the National Telephone Company's undertaking.

And the policy of the Government was to take only the trunk system?—Yes.

And the tendency of the policy of the Government was to discourage competition?—That was the tendency.

Further examined by Sir J. Woodhouse, Witness said there was no effective competition between the New Company and the National, for the New Company had no exchange. The competition in Manchester was a very feeble competition. The tendency of the policy of the Post Office since 1892 had been towards making the National Telephone Company a monopoly, but at the same time all the rights of the Postmaster-General had been fully preserved. The heads of the 1892 agreement were brought before the House of Commons in 1894 when it was laid on the table. The Treasury Minute lay in the House in May, 1892, and the Bill to raise the money for the purchase came before the House on May 26th, 1892. The agreement was signed August 11th, 1892, and the Postmaster-General went out of office on August 19th. The agreement was signed the day the vote of censure on the Government came in.

By Mr. Colville: Some of their subscribers in Newcastle had been obliged to become subscribers also to the National Telephone Company.

By Mr. Boscawen: General application had been made by local authorities and other companies for licenses to start telephonic services in different towns, and they were ready to comply with the terms of the Treasury minute. The Postmaster-General had been in consultation with the Chancellor of the Exchequer on the subject, and they had not seen their way to granting those licenses. He thought they had considered each case and had arrived at the conclusion that they were not justified in granting the request. They had received applications from the Corporations of Glasgow and Tunbridge Wells and Manchester, and in Glasgow it was admitted that the service was defective.

Mr. Boscawen: Yet in no case has a license been granted?—No.

Consequently, the condition in the minute is practically a dead letter?—The right is there still.

Is the right of any use if it is not carried into effect?—I think it is.

Is it the intention of the Post Office in the case of future applications to refuse as the previous ones have been?—I think that is a question that the chairman could answer better.

Have you any different line of policy in the Post Office?—I must decline to answer that, unless the chairman instructs me.

Have not the Telephone Company taken the cream of the country?—They began in that way, but they are extending their services.

Proceeding, Witness said he would not allow municipal bodies to establish telephonic systems in places where there was no service, but would leave it to the Post Office. The Post Office had not established many services of late years, because there was no demand for them. From their own point of view, the company had pursued the wise policy of getting the leading men of different places to work with them. He did not know the means employed, but it was the outcome of a bad system. From a commercial point of view, it was not an unreasonable system for the company to adopt. His remedy would be to take over the whole system, and put it in the hands of the Post Office.

By Sir H. Howorth: When the legal proceedings against the Telephone Company were going on the Post Office submitted proposals to the Treasury for establishing telephones, and in a letter dated December 16th, 1880, the Treasury consented on the understanding that it would enable the Department to negotiate satisfactorily with the telephone companies. He believed that great inconvenience to the public would arise if they had competitive systems in different places. It would probably take eight or nine years for the Post Office to establish a really proper competitive system over the country. In Sweden the State had bought up all the local districts, with the exception of one. In France there was no private company, and in Italy there never had been a private system. The only place where there was a municipal service was Holland, and in that country the trunk lines were in the hands of the Government. Some facilities had been given by the Government to the Telephone Company outside the agreement.

NEW HAVEN STREET LIGHTING.

The average reports of city lighting committees are not absorbingly interesting documents, but once in a while we (New York *Electrical Engineer*) come across one that gives us some real information. An example of such is the 1897 report of the Committee on Lamps of the city of New Haven, Conn., just issued. As the lighting of this city is in most intelligent hands a closer inspection of this report will prove of value to lighting committees and central stations as well. New Haven is lighted by three systems, gas, naphtha, and electric; there being 442 arc lights, 105 Welsbach, 633 plain gas and 512 naphtha lamps. All lighting is done by contract with private companies. The city is now paying $98·55 per arc light of 1,200 C.P., the electric lights being lighted at dusk and extinguished at dawn every night in the year, thus covering 4,000 hours of burning. Regarding the question of complaints due to outages, &c., we notice that from these various causes gas gave rise to 1,168 complaints, naphtha 709, electric lights 401. Quite a marked percentage of these complaints were due to the effect of a high wind last November, in which, however, the electric light showed up remarkably well. While none of these were out or broken, the Welsbachs showed one out, plain gas showed eight out and one broken, while naphtha showed 77 out, for that one night. During the whole year 278 lamps were reported out at various times, of which 50 occurred in a single night during February, 1897, when one of the circuits was broken by a falling tree during an extraordinarily high wind. Considering that the total number of electric lamps is 442 burning every night, and that only 278 lamps were reported out during the entire year, the record is a very good one. That the service must have been excellent is strongly evidenced by the fact that the entire amount deducted during 1897 from the bills of the electric light contractors was only $21 33.

In his very able comments on the figures presented, Mr. Henry Hopkins, Superintendent of Street Lighting of New Haven, states that the service rendered by the electric lighting contractors has been of a high grade. Mr. Hopkins also has something to say on municipal ownership of electric lighting plants, and as we believe his motives will not be questioned by any one who has followed his career, his opinion is worth recording. Mr. Hopkins says:—"From what data and facts I have been able to obtain on both sides of the subject, I would say, that until the time comes when more information and accurate facts can be obtained, it would not be good business policy to enter into any such project. The recent showing up of the Philadelphia Municipal Gas Works amply sustains my belief, and ardent supporters of municipal ownership must have received a severe shock. And it is only one of many cases that could be quoted." Coming from a city official, this is a most encouraging sign that there are still many clearheaded men in municipal employ in America.

Electric Power for Mines Drainage. — A second scheme for unwatering the Tipton mines was enunciated before the South Staffordshire Mines Drainage Commissioners on Wednesday last week. It was explained that the first scheme had gone as far as it would at present. The drainage of the level had not quite had the anticipated effect. They expected it would fetch out at least 3,000,000 gallons, whereas it had only brought a third of that amount. The question they had to decide therefore was what was to be done in regard to the unwatering of the mines, seeing that they could not expect by any reasonable amount of levelling to attain the end they desired — in fact, the cost of driving levels into every proprietor's colliery would be larger than could be met by the funds the Commissioners had at their command. It was, however, absolutely necessary that they should deal with the water in some way or other. The original Tipton district engineering scheme was to have two large pumping engines at different stations, and an extensive hydraulic system whereby they could pump from various points in the district which were not reached by the main engines. Since the scheme was propounded, the Midland Electric Corporation for Power Distribution, Limited, had tried to establish themselves in the district, and if they succeeded, as they believed they would, the Commission, instead of having to find a large capital for an hydraulic system, besides the heavy cost of maintenance, would get a supply of electrical power at so much per unit, whilst the capital outlay would be considerably less. It appeared most desirable, if the Electric Power Company came into the district, that they should take advantage of their scheme, in order to drain the surface at points where at present water got into the mines because they were lower than the brooks, and at which no amount of levelling would be thoroughly effective. Their general manager (Mr. E. Howl) and surface works engineer (Mr. E. B. Marten) had gone carefully into the question, and found that there were at the present time about 50 points in the district below any drainage, where reservoirs could be made and pumps started driven by electrical power. By having these stations and electrically-driven pumps to deal with excessive rainfalls quickly, it was believed that the quantity of water now getting into the mines would be reduced by about one-third, which would be a great saving. They were now pumping, roughly, about 9,000,000 gallons every 24 hours, and if the suggested scheme could be carried out this quantity would be reduced to about 6,000,000 gallons, which their present engines could cope with. Then it was proposed to deal with that water which found its way into the mines, but would not flow to the main engines, by a system of semi-portable engines taken, by arrangement with proprietors, to collieries where they were most required. Probably eight or ten such pumping stations would drain the whole district, and enable mines to be worked that were now under water. The Commission had obtained authority to spend £100,000 on the Tipton district engineering scheme, but up to the present they had not spent much of this amount. It was calculated that the capital sum required to provide the 50 pumping stations would be about £20,000, in addition to which there would be the price to be paid to the company for the supply of the electrical energy and the cost of looking after the various stations. The sooner, the chairman added, the Electric Company came forward and helped the Commission out of their difficulty the better. The company had offered the Commission terms which were satisfactory, and he sincerely trusted that they would be able to carry out their proposals.

Electric Launches.—We understand that the British Electric Traction Company have undertaken the control of the Immisch Electric Launch Company, and that launches can now be booked at Donington House, Norfolk Street, Strand. The Immisch Launch Company, who were the pioneers of the electric launch business, now possess a fleet of over 20 launches, which are acknowledged to be the finest on the river Thames. An interesting descriptive and illustrated pamphlet, giving full particulars as to rates, and much useful information to frequenters of the river, can be had on application. The headquarters of the company are still at Platt's Eyot, Hampton.

THE MUNICIPAL ELECTRICAL ASSOCIATION, 1898.

SWITCHBOARD APPARATUS.*

By J. R. Blaikie, Chief Assistant Electrical Engineer, Bristol.

The control and measurement of electric energy is one of the most fascinating details of this branch of engineering.

The switchboard, with its glittering array of polished metal and graduated dials, has always an attraction for the lay mind, while its intricacy or beautiful simplicity is a source of wonder or poetic appreciation to those better acquainted with such devices.

Almost every station has some noticeable peculiarity with regard to its switch gear, and there are few stations that have not lived to see radical changes brought about in this portion of the original scheme. The result at the present time is that it is almost impossible to classify the types now in use. This striking nonconformity, although intensely interesting, is not particularly happy, since it appears to show either ignorance or vanity on the part of the designers.

One must admit that the spirit of commercial industry is to suppress varieties in favour of a standard. It would be ridiculous to suppose that the mere straining after novelties has been the whole cause of the present multifarious assortment. Switchboards have been conscientiously designed and constructed to suit individual cases, simply because there was no general standard that might be adopted. After certain results and experiments, modifications and improvements have been gradually introduced. But this form of private research work is too frequently misguided and uneconomical. The experimenter cannot, as a rule, afford to test a portion of his work to destruction. So long as it answers his immediate purpose he is satisfied.

A certain elegance of variety and some treasures of ingenuity must be sacrificed to further the march of scientific progress. One must be content to labour in a vast organisation and strive towards a higher ideal than a more or less original switchboard. It is hard for a young enthusiast to surrender an opportunity for displaying a capacity for design in a field of such unlimited possibilities. It is far easier for him to imagine that there are peculiar necessities and requirements in the case under consideration; but seeing that there are life risks, and that the very heart of the undertaking lies in the switchboard, surely it should be the outcome of the strongest possible combination of experience, and beyond the reach of individual fancy.

* Read June 8th.

Before dealing with the disposition of the component parts of the switch gear, it might be well to inquire into the duties and characteristics of the details.

The necessity for ever breaking a circuit while carrying much energy is not universally granted. For example, Prof. Forbes, in his paper on "The Electrical Transmission of Power from Niagara Falls," November 9th, 1893, says: "I hold that it is a piece of culpable ignorance, ruinous to the machinery, if anyone should ever, on a large power circuit with alternating current, suddenly break the circuit while current is passing. The practice is quite unnecessary, and has given rise to a large proportion of the breakdowns of alternating current machinery." Nevertheless, there are switches at Niagara (see *Cassier's Magazine*, page 291, Niagara number) capable of breaking 5,000 horse-power, without damage to themselves, &c. Prof. Fleming agrees with Prof. Forbes, but he asks what happens if the circuit opens itself, and what is to be done about fuses. Unfortunately Prof. Forbes omits these points in his reply.

In practice, of course, one never opens a circuit conveying much energy, unless some unforeseen circumstance throws the whole or a portion of the machinery out of the usual control. Could not such emergencies be met by inserting a moderate amount of resistance or impedance in the circuit, increasing either by degrees, if necessary? The same might apply to cut-outs when they are under the observation of an attendant. In the author's opinion main switches should work through steps in this manner, making it impossible to make or break with large currents.

Assuming, as is customary, however, that a sudden break is necessary, or that the switch is in such form that a sudden break could be made by a mistake, or accident, on the part of the attendant, while transmitting a large amount of energy, the essential characteristics of the design appear to be as follows:—

1. That there shall be no danger to the operator, either by electric shock or from particles of molten metal flying free, this latter to apply to adjacent apparatus as well.
2. That there shall be no maintained arc.
3. That the contacts shall not be burnt or injured, in such a manner, as to prevent the efficient working of the switch on closing again.

4. That the contacts and current carrying portions of the switch shall always be in such a condition that no heating will occur while carrying the maximum current for an indefinite period.

With reference to the first condition there are several well known satisfactory examples. The plug form having a large insulating handle and shield, the breaks being in earthenware pots, gives a pretty certain immunity from danger. A sufficiently long handle or mechanism actuated by cords can be considered safe.

Another method is to mount a plate glass screen between the operator and the breaking contacts, but this does not protect the other apparatus.

To secure a certainty of break many contrivances have been devised. The simplest means is a sufficiently long air-gap in the circuit.

For the sake of eliciting the opinions of the gentlemen assembled, some breaks (total length) for various conditions are suggested, assuming that the breaks are made with considerable and uniform rapidity.

Amperes	100 to 300 volts alternating or continuous.	500 to 1,000 volts continuous.	2,000 volts alternating.
	Inches.	Inches.	Inches.
5	¾	4	4
25	1	6	6
50	1¼	8	10
75	1¾	10	12
100	2	12	13
150	3	12½	14
200	4	13	15
300	5	14	16
400	6	15	18
500	7	16	20

(When these breaks are in the tubes, and so protected from air currents, it might be well to add, say, 50 per cent. to the length of the gap, and the same if the breaks are in a vertical direction.)

The air-gap may be in one line, but in order to save space and ensure a rapid break, it is more frequent to have several breaks made simultaneously in a circuit. It is not safe, however, to draw out two or more arcs, close together in air, without a substantial fireproof insulator between, as a slight current of air will blow them together, and thus defeat the action of the switch.

The plug switch becomes rather too cumbrous in large sizes since the sockets must be very deep or the plugs must be spaced out considerably.

One very happy solution is the use of an electro-magnet in the main circuit to blow out the arc when it is formed. Another effective, though perhaps rather complicated means, is the application of a shutter, or clapper, which flies through the path of the arc and blows it out with the air currents set up. Some other designs cause the circuit to be broken under water or an insulating oil, but to the author this appears to be a last extremity, as there are obvious objections to the use of a liquid.

To satisfy the 3rd condition "that the contacts shall not be burnt, &c.," is a comparatively simple matter. The rate of breaking is a primary consideration, though it may not apply so forcibly in the case of the alternating currents. The use of springs, or the multiplicity of simultaneous breaks, suggests itself at once. A liberal weight of metal, or the proximity of a good heat conducting fireproof insulator, reduces the temperature of the arcing points somewhat. As an extra precaution, the blades are usually made of wedge shape, and plugs are tapered, so that they may clear themselves more or less on returning, by shearing off the small globules of metal left on the contact faces. It is therefore desirable that the mechanism should be able to withstand such strains, and so proportional that sufficient force can be applied. Another way of overcoming this difficulty is to provide auxiliary contacts which break just after the main contacts, and so carry the arc. These contacts may be merely butting surfaces, which are not much the worse for being burnt, or provided with easily renewable faces, or some material having a high melting or volatilising point; such as carbon.

The degree, in which the various switches on the market meet this requirement, is readily seen.

The current-carrying capacity of the contacts is of the greatest importance, since a defective contact deteriorates at a sort of compound interest law. Taper plugs and spring jaws almost invariably share this responsibility. When one reflects that trouble from this source may loosen the whole contact from the board by destroying an ebonite bush, melt the solder from a sweating thimble, and allow a cable to fall, or even render the handle of the switch useless or unsafe, there is enough material for serious thought. In addition to this, there is not a very far remote chance of fire. Possibly there may have been few accidents up to the present time from this cause, owing to the newness of the apparatus, or from the fact that many switches are not working up to their full capacity. Certainly in point of design this is one of the weakest features. In some instances, the spring in cast brass and copper, without any means of adjustment for wear, is all that can be relied upon. In the case of four plugs rigidly fixed to a handle there are instances where they are supposed to go tight home into four *fixed* conical sockets. There are a few relics of the dark ages, when current was allowed to pass through the hinge or pivot of a switch. Of course there are contacts of the laminated type, built up of hard drawn or hammered copper, which are admirably suited to their purpose. As a general conclusion, under this heading, it appears that it is advantageous to have few, preferably only one breaking contact in a circuit, which can easily be arranged by means of flexible connections. This arrangement gives the operator an opportunity of feeling the condition of the spring contact while forcing the switch home.

It has occurred to the author with reference to this subject, that there might be a useful application of a well-known invention of a paint which changes colour on heating.

The merits and risks of automatic apparatus open a very wide question. Where springs are employed, they should only be strained through a small part of their range, and carefully secured from all possible chances of getting heated, either by current passing through them, or by conduction or radiation from other sources. There should also be some provision for retaining the spring, or parts of it, should it happen to break. A single speck of rust on a steel spring will sometimes cause it to break; but the reliability of such springs as are used in watches and rifle locks may be urged in favour of their use when thoughtfully applied. Weights released by triggers and catches are frequently used with success, but the inertia may sometimes be a drawback. Special attention should be paid to hinges, &c., in such apparatus, since a slight defect may alter the adjustment, or foul the whole mechanism. In switch work it is quite common to have brass working on brass, both of the same composition; this is sure to cut and bind in time. When it comes to talking of an automatic appliance that does not work, adjectives fail. Another point sometimes neglected is the provision of suitable buffers, or arrangements for taking up the mechanical shock or jar. Unfortunately nearly all insulating materials are mechanically weak, so they should never be subjected to rough usage. In most cases these switches are set by hand, and can therefore have strong reliable contacts. Where they have to be operated at a distance by means of a small current, the contacts are a serious trouble. An accumulation of small impulses can be used, or the much-abused mercury cups have to do duty. There are details in mercury cups, however, which make all the difference. The cups should be of iron nickel-plated, the copper forks should also be nickel-plated, and be shaped to cause as little splashing as possible.

For large currents and high voltages a multiplicity of breaks should be employed, so that a comparatively low speed will be sufficient. The author has had under his notice a switch for 15 amperes, 100 volts, in daily use for about three years. Three others, one for 15 amperes, 200 volts, the other two from 8 to 15 amperes, 100 volts, for 18 months. All these switches have given complete satisfaction, and up to the present time have required absolutely no attention.

Switches requiring a shunt coil permanently in circuit are generally looked at askance, not for the sake of the coal here represented (though one does sometimes hear about the fuel consumed by a voltmeter) but mainly because the shunt coil has been known to break down.

If it were recognised that a coil will not stand unlimited cooking at, say, 150° F., that it is subjected to high pressure strains, due to induction at times, and that in the case of alternating currents, the wires must be specially supported and secured to resist the tendency to vibrate, then perhaps a coil could be made worthy of the occasion. What may be good enough for a single arc lamp is not good enough to bear the reputation of a cental station.

So much for main switches. Plug connections have some points in common, though the problem is very much simpler. A taper plug between two blocks of metal, although almost universal for laboratory instruments, is rarely, if ever, used on a switchboard. A spring clip made to sandwich two projecting tongues is sometimes used, but the most usual form is a screw plug to connect bars on the back and front of a slate panel. Another form connects a back and front board by pushing a parallel plug through spring contacts. Ample weight of metal will, in most cases, make a sound connection, since there is nothing to impair the original fit.

For very heavy currents, perhaps, in the case of screw plugs, it may be well to have a spanner appliance instead of the ordinary fluted handle. The fire risks should also be considered, in the event of a plug being taken out by accident while carrying a current. Facilities for replacing a portion of the bars damaged in this way would be advantageous.

Fuses, although so simple in conception, are often one of the most troublesome details. For low tension circuits certainly the problem seems elementary, yet there are cases where links of copper as large as the mains have been substituted for fusible metal.

There is a difference of opinion as to the most suitable metal for a fuse. Tin, lead, and copper are generally employed. Then comes the question as to whether a thin strip, a single wire, a number of single wires stretched parallel to each other, or a number of small wires twisted together, makes the most reliable fuse.

The purity of the metal is also of great consequence. In designing a fuse, the objects in view are:—

1. Safety to attendants and adjacent instruments from molten metal or splintered insulating material.
2. A positive break in the circuit when the fuse does melt.
3. An accurate knowledge of the capacity under the condition of its mounting.
4. Durability.
5. A safe, simple, and rapid means of replacing.
6. Mechanical strength, rendering it independent of skilled or specially careful handling.
7. Protection from other sources of heat from imperfect contacts, &c.
8. Compactness.

Taking a few common examples, they are mostly defective in one or two points.

The tin strip reduced in section at the centre is generally suitable for low tension work, but it is almost invariably unprotected, and frequently in such a position that it will blow right in an attendant's face if he should happen to close a switch on a "short circuit."

This type is the most durable, and the most accurately gauged, but if a large range of sizes is required it is a nuisance to have to keep so many spares, especially as they are usually of a particular pattern. A rapid replacement is managed by throwing over a link or inserting a plug to connect another fuse already mounted. Otherwise it is satisfactory.

For high tension work, there are quite a lot of examples that will not break the circuit in the case of a sudden "short circuit." Copper wire is generally most successful, since there is a less quantity of vaporised metal left in the path of the arc. In very small sizes, however, it is difficult to manipulate. Running in its normal condition, at a high temperature it deteriorates rapidly. Again, with a variety of fittings and mountings, the value for any particular gauge alters considerably. Where the balance is held in favour of copper, there should always be an easy means of inspection at any time. Either a transparent shield should be used or a duplicate system employed, which will allow a fuse to be removed and examined without interrupting the supply. One well-known fuse consists of a length of wire soldered at either end to plugs having ebonite handles. The mechanical weakness of this arrangement may lead to serious accident. The operator gets one plug in, then, perhaps, breaks the wire, and the live end sags down and touches his hand. Besides this, there is the inconvenience of having to solder the wire to the plugs. Another has a wire fitted into a gauge glass, sealed at the ends, and half full of a liquid. These have been known to explode with great violence. Let us hope that they have long since joined the ranks of "our old type."

A lead wire encased in an India-rubber tube, or a copper wire in an asbestos sheath, have been used with success as far as the break goes; a wire in a glass or earthenware tube, with the ends open, is reliable if of sufficient length. One of the most recent designs has many novel features. The holder is in the form of a drawer made of earthenware, having a partition down the middle lengthwise. The fuse is a short length of wire, strained over the partition by means of two springs, the current being conveyed through flexible conductors from two wedged contact pieces projecting from the back end of the drawer. When in use the drawer is filled with a special oil and pushed home, so that the wedges enter spring jaws. When the fuse wire melts, the springs carry the ends down under the oil, and so extinguish the arc. The makers claim that with this fuse 500 amperes at 2,000 volts can be broken without any hitch.

The percentage of error in adjustment must be rather large, since it would take some time to warm up a large mass of earthenware and oil, and again, the unknown tension of the spring introduces another source of error. The fuses are arranged in duplicate for inspection and rapid replacement and are extremely compact.

Ammeters.

Ammeters for the switchboard should be altogether different from laboratory instruments. The scale should be more accurately readable at the lowest part, if there is any difference. On a rising load, one cannot run too close to the capacity of a machine, while it is of the highest importance that one should know when the load has fallen sufficiently when switching out a machine. Again, when used on circuits, for perhaps 20 hours out of the 24, they are only indicating on the lower part of the scale. In practice they are often subjected to powerful external influences, since it is generally convenient to fix them close to the main omnibus bars. They should, therefore, be specially protected from such disturbances. The moving parts should be strong enough to stand excessive currents passing momentarily, and for many cases the movement should be damped.

An ideal instrument, if not quite dead-beat, might have a damping arrangement adjustable, so that the necessary amount could be applied under peculiar circumstances. An arrangement of terminals such that a standard instrument could be connected in series by means of flexible leads to enable the instrument to be checked while in position would be very convenient. Where a glass cover is used, it should be far enough away from the pointer to minimise errors due to static charges on the surface.

The Edgewise pattern is becoming popular now for two reasons; it is more compact as a switchboard fitting, and when fixed in rows, and the index of each standing at a different value, you get a curve formed. The shape of this curve becomes more or less familiar to the attendant, so that he more readily notices a change which may point to an irregularity in the outside system. Ammeters for the exciting circuits of the machines are usually only required for alternators. To make intelligent use of these, they should be easily readable through the range of the rheostat. They need not be readable below the minimum current required for excitation. They should be very accurate, well shielded from external influences, dead-beat, and strong enough to stand rushes of current when the field is switched on or off.

It is impossible to pass over the subject of ammeters without drawing attention to the Weston instruments. To those not familiar with these, a summary of their advantages may be of interest. Unfortunately they are only suitable for continuous currents. The scale is perfectly uniform throughout the range. The action is remarkably dead-beat. The accuracy is very high, it is independent of external influences, and the calibration is not impaired by comparatively rough usage. The current measured does not pass through the instrument, so that it may be used on any part of the board, the connections being two small wires. It is really a voltmeter, measuring a minute difference of potential across a shunt which is placed in the main circuit. Any number of shunts can be connected by means of small plugs to one instrument. A pretty device sometimes used with these ammeters is a luminous scale. The scale is translucent, the gradation lines and figures being opaque. A small lamp fixed behind shows up the reading boldly, so that it may be seen at a distance. The recording ammeter is rarely used, and it is, perhaps, an unnecessary refinement.

Integrating meters, ampere-hour, or wattmeters are hardly switchboard apparatus at present. They certainly would be useful adjuncts, and will probably become general. The usual form of case may be an objection. If the makers would turn out something all over lacquered brass and a reasonable shape, there might be a development in this direction. The same remarks on ammeters with reference to calibrating with a standard instrument might be applied here. The roller form of register instead of dials, in a large size, which could be made of aluminium, would be an attractive feature.

Voltmeters.

It is most essential that voltmeters should be accurate instruments. They must be sensitive to very small changes, and for some classes of work dead-beat. They should be free from temperature errors, and capable of continuously indicating the normal pressure for very long periods. They should always be protected by fuses easily accessible. Remarks on ammeters with reference to static charges on glass covers are applicable in some cases.

There are three distinct classes of voltmeters in every day use, electro-magnetic, electrostatic, and those depending on the expansion of a metal due to heat. The electro-magnetic are not available for alternating currents generally speaking, and except for the purpose of recording instruments, where some power has to be expended in overcoming the friction of the pen on the paper, they do not possess many advantages. The Weston instrument, however, from its dead-beat action and extreme accuracy, is again a favourite. As a voltmeter it can be fitted with a luminous scale, and it is usually provided with a movable index in the shape of a disc, which eclipses a circular aperture in the pointer. This form of index is very easily seen from a distance. Electrostatic voltmeters are useless for recording, and some forms are liable to stick, owing to the very small forces which actuate the pointer. They can, however, be used for alternating and continuous currents, and they consume a minimum of energy. They are most commonly employed for high tension work. Some engineers object to a dangerous potential across an instrument, especially as it has to be observed closely, and frequently tapped to ensure a correct reading. A small sparking gap has to be introduced to protect the instrument, and with concentric mains a momentary rise of potential is common and causes the fuses to blow.

The familiar "Cardew" is a most useful instrument, being applicable for continuous and alternating currents, and is very dead-beat in action. It gets out of adjustment rather too easily, however, and is an awkward shape to accommodate on a switchboard. The horizontal pattern is much steadier than the vertical owing to the steadier rate of cooling. The consumption of energy is rather heavy. In spite of its many defects it is very popular, probably its wide open scale and sensitiveness compare very favourably with rival instruments.

Recording voltmeters are developing, and may now render faithful accounts of electrical pressure. But from some points of view they are still imperfect instruments, since they may sometimes ignore the willingness of the spirit, whilst testifying to the weakness of the flesh. Where these instruments are used, the temptation to tamper with them should be removed, and the interpretation of the charts humane.

Rheostats, Multiple Switches, and Field Switches.

Rheostats are often suggestive of the skeleton in the cupboard. They are unsightly, and the connections are frequently clumsy, even though they may be sound. The choice of resistance material is a matter of great interest. Some alloys possessing excellent qualifications under laboratory tests have been found to have become rotten and brittle after a few years use, or they may suffer mechanical injury during construction, either from bending, &c., or heat applied for soldering. Radiating surface should constitute one of the principal features of the design, ventilation being not an unmixed blessing, as the more air you get through the rheostat, the more dirt and dust is deposited. Compactness is desirable where it can be obtained without sacrificing other advantages. The displacement due to the expansion of the metal while hot must be provided for, and in forms other than the spiral, this is rather an awkward matter. Spirals of wire are unsatisfactory, since they are liable to shake together and interlock if accidentally displaced. They accumulate a lot of dirt, are inconvenient to clean, and also involve comparatively confused connections to the multiple switch. Where a rheostat is only in the field circuit of an exciter and consequently small, it may be wound on a block of slate having a sliding connection along one edge. The slate absorbs a good deal of the heat, which can then radiate from the larger surface. It is objectionable to have the contact on the actual wire, as the wear and any slight sparking might in time cause the wire to break. A great advantage, however, can be claimed from the fact that such an arrangement may be fitted on the board always in sight and kept thoroughly clean. An improvement on this form and suitable for larger work is effected by having special contact pieces fitted, and in the use of several small wires in parallel, whereby a large radiating surface is gained. Tubular resistances would be better still, introducing at the same time additional mechanical advantages.

With reference to multiple switches, besides ample current carrying capacity, there must be exceptional provision for wear, as this may be very heavy. Circular switches, or linear motion derived from a screw, are most usual, but as there is a chance of the operator forgetting for the moment which way to turn the handle, it is preferable, in the author's opinion, to have a lever working through a quadrant in a verticle plane at right angles to the board, the connections being so arranged, that the rising of the handle raises the voltage of the machine.

It is sometimes necessary to make fine adjustments, and occasionally large alterations rapidly, so that a good regulating switch should have two handles, one having a number of intermediate steps between any two steps of the other.

Field switches should always be so arranged that they short-circuit the windings at the instant of cutting off the current. The author is acquinted with two designs, one by Messrs. Siemens, the other by the Electric Construction Company, which are well suited for this duty.

SYNCHRONISING APPARATUS.

In alternating current stations this apparatus is of first importance, and should be the object of the designer's special care and foresight. The possibility of a mistake on the part of the operator should be thoroughly investigated. The risk of breakdown in any part of the apparatus having been reduced to a minimum, provision should be made for replacing any defective detail within a minute or two, with no possible chance of reversing a connection, or there should be a simple method of throwing a spare set into circuit. There have been three or more methods suggested for synchronising. First, two lamps, or one lamp and a voltmeter, in series, off the secondaries of two transformers in series, the primaries being one on each of the pair of leads required to be synchronised. Second, a similar arrangement, having a telephone or buzzer to indicate the flow of current through the secondaries. Third, gold-leaf electroscope which can be used direct on 2,000-volt mains. The first method is almost always employed, and it has the advantage of being easily seen by the driver, enabling him to adjust the speed of his engine. This information can also be obtained by lighting the station with alternating current arc lamps. When the armature is at the correct speed, the coil holders appear to be stationary, or revolve very slowly forward and backwards as the speed is too high or too low. It might be almost worth while to switch on a lamp in broad daylight, when synchronising, for this purpose. Where alternate current arc lighting is adopted a gold-leaf synchroniser could be used. It is more secure from breakdown for having no transformer. It is very dead-beat, but at present it has not been developed as a switchboard instrument, and requires modification to preserve the extremely high insulation necessary. While on the subject of synchronising, it is instructive to notice that in English stations an artificial load on the incoming machine is considered unnecessary, although usually employed on the Continent.

In one English station it has been found advantageous to parallel machines through an impedance coil, and then short circuit the coil in two steps. As an extra precaution the paralleling of all machines, up to 400 kw. capacity, is done through a 20-ampere fuse, and this fuse is not blown more than once a month. (It may be mentioned that the armatures are of the coreless type.)

Having discussed the details, the general arrangement and construction of the board may be criticised. Slate or marble are usual as a base, but all holes should be bushed with ebonite, and ebonite plates fixed under all instruments for high tension work. There is a skeleton form, however, made of a lattice work of wood or angle iron, on which the various instruments are mounted. This form is highly efficient from many points of view, but in appearance it is untidy, and it occupies a good deal of room. A recent development consists of a number of cells, made by vertical slate partitions fitted into slate shelves, which are built into the wall. In this arrangement there is, of course, no back, the connections being visible from the front, and carried up through a vertical series of cells.

The commonest form of board is constructed of slate slabs, or panels, having the instruments on the front and all connections at the back. It is the back of such boards that should be most closely watched. It is often necessary to change an instrument, or connect a new machine or feeder, and with high tension current at all points such work is frequently attended with great personal risk. Accumulations of dirt and dust have also to be removed periodically.

Such boards, if designed in a standard panel form to permit extensions, should also have a standard system of back connections suitably protected, and in no case should miscellaneous cable and wire connections be allowed.

On double-pole boards the opposite poles should be far apart, either horizontally or vertically. For the arrangement of omnibus bars and varieties of combinations some reasonable limit should be fixed.

Breakdown terrors are usually more prominent in the minds of high tension engineers. They may stimulate more careful design, but there is also a tendency to run to seed in a progression of combinations. It may be reasonable to have a means of dividing the main omnibus bars, and perhaps have a spare set, sometimes called "hospital bars," for the purpose of connecting any particular circuit or any particular machine.

With reference to the relative position of the apparatus there is a decided preference for the complete set belonging to one generator, or one feeder being in a vertical line, well marked. It is also advisable to have the lines as close as possible, in order that the effect of any adjustment can be watched in the other lines. This principle is so important that where some parts of the apparatus are necessarily large, it might be worth while adding auxiliary gearing to permit of concentration. It is, of course, essential that the handles of all the controlling gear should be within easy reach, and that the indications of all instruments should be accurately readable from a convenient position.

A necessity or temptation to lean or stretch over any portion of the board should never exist.

It seems almost absurd to mention such an obvious precept, yet it is common enough to find a clock which has to be wound periodically mounted on the top of a switchboard. There are boards protected on the front, but this rather encourages carelessness, and is often at the expense of safety at the back. By all means guard against every conceivable accident, but under the roof of a central station a board should be assured from wilful misuse or grossly ignorant handling.

A main switch, fuses, or other safety device, and ammeter, are among the first requisites of a panel; then, perhaps, there may be plug connections, synchronising connections, field switch, and rheostat switch. Voltmeters are usually common to the whole board, and here a suggestion may be borrowed from an American practice—in that of mounting a voltmeter on a swinging bracket from the end of the board. It can then be moved to show to the best advantage at that part of the board where an adjustment is being effected.

Field switches may be advantageously mounted on the machine; by this arrangement there is a saving of conductors, and the man who lets down the brushes may be more confident that the machine is not excited at the time. For continuous current machines the rheostat, and multiple regulating switch, might also be mounted on the machine, or on the wall close by, thereby saving long conductors. Since the electrical pressure regulation is shared between adjustments of exitation and speed, both may be fittingly performed by one man, preferably the driver or dynamo attendant, whose attention can thus be directly called to the brushes at every alteration. Further, it can be urged that fire risks are minimised by distributing the rheostats, and situating them away from the wood platform or other such work in connection with the switchboard. In the case of alternating current machinery, the rheostat switches at least must be on the board, or close at hand.

But there are some alleviations to compensate for the fire risks involved. Alternating current usually means high tension, and the heat generated is of use in keeping the board at a slightly higher temperature than the surrounding atmosphere. There are occasions, when there is a fog, or perhaps in the event of a mishap with steam connections, that this higher temperature may save condensation and consequent troubles.

One of the most pressing considerations in connection with the switchboard, as a whole, is the efficient protection from dust and accumulations of dirt, especially at the back. Not only should elaborate precautions be taken, but an easy and safe means of inspection and cleaning should be a prominent feature of the design.

From an æsthetic point of view, a little license can be granted if all details are well designed. Wood mouldings and panelling add greatly to the general appearance. Some engineers severely cut down anything that is inflammable; this, like everything else, can be carried to excess. When one considers the proximity of such material to an open fire, in an ordinary dwelling house, and the small risk one attaches to it, a little ornamentation on a switchboard appears to be reasonable. There is no necessity, however, to make a switchboard a subject for rococo decoration, and, as mentioned before, there are fitter places for a clock than in a surmounting scroll.

With a view to standardisation, another suggestion hails from America. One of the largest firms manufactures unit panels always on a standard size of slate. They make 14 different capacities on a panel 48 inches × 16 inches × 1¼ inches thick, and a blank panel 28 inches × 16 inches × 1½ inches to go underneath. They are bolted on to steel frames and adapted for unlimited extension. The space required for a switchboard is not of such great importance if correctly estimated when designing the buildings. Too often, however, it has to go somewhere between two windows, in a cramped position, with little or no room for extensions.

The best position is probably on a gallery extending down the length of the engine room, except in belt or rope driven stations, in which case it should be parallel with the drives to be safe, in the event of an accident with the gearing. An elevated position such that the operator can see and signal a driver at the stop valve of any engine is about the ideal.

Though perhaps a little foreign to the subject, a system of engine-room signals might be conveniently touched upon here. It is too small a matter to be treated on under its own heading; but, at the same time, it is important in the administration of duties from the switchboard. In large concerns a well organised system is indispensable, and in small stations, therefore, unorthodox signs should be considered as bad form. The practice of shouting and cat-calling about an engine room, though it may betoken hearty goodwill and enthusiasm among young assistants and pupils, is, to say the least of it, undignified; such cries should be reserved for personal accidents. A regulation whistle or bell, whichever can be more clearly distinguished from the usual hum, should serve to call the attention of drivers. The number of a machine can be indicated by displaying a tablet having both sides painted the same. If the board can be seen from every stop valve, alterations of speed can be signalled by moving an extended hand and arm "up" or "down," the driver signalling the normal speed by moving his hand rapidly back and forwards in a horizontal plane. When the view is blocked, different toned bells, or a number of strokes may be employed, but it is remarkable to find how easily such signals can be forgotten, or confused, after being in daily use for months. Another method is to illuminate a small window, having a word painted on it, by means of a small lamp. Almost any method will answer the purpose provided that it is universal.

Turning once more to the question of standardisation, manufacturers have now had the opportunity of gleaning from innumerable specifications, and of silently witnessing some failures. Perhaps a psychological treatise on the switchbard attendant is still required.

There are, without doubt, some curious instances of irregularities due to absence of mind or fatigue. It is not at all uncommon to see a man feel the bearings and fill the oil cups of a standing machine; but when it comes to the switchboard attendant signalling "raise speed" on a particular engine, the driver adjusting the governor of a *standing* engine, and the attendant signalling back "all right," the subject becomes distinctly interesting. Then there is the man with the laboratory training, who taps every instrument, including the clock and the almanack, before taking a reading. Fuses and plugs have been pulled out while carrying currents. There was a story once of the exciting current being switched off an alternator while running in parallel. Possibly designers have already, or can easily obtain sufficient information of this description for their guidance.

Once launched on this fascinating theme ideas and suggestions spring like mushrooms. In the interests of science let us suppress the prolificacy of imaginations, born of watching and wakefulness, in the midnight hours.

Leave such work to professional designers who regard inspirations in the positive degree, and to men who live for "estimating," before whose searching gaze the colours and glories of originality pass and die away.

The author has endeavoured to point the necessity of good standard work for switchboards, and to discourage the individual of designing propensities among "Resident Engineers." He is aware that much has been done already towards establishing a standard, but has recently received replies to inquiries from several large manufacturing firms, "we have no standard, as we find all specifications differ."

It should be reserved for the resident or consulting engineer to judge, a representative body of engineers to frame rules and regulations, and for designers and manufacturers to perfect details and study economical production.

In conclusion, the author desires to express his thanks to the gentlemen and firms who have rendered him liberal assistance in the preparation of this paper.

SINGLE v. MULTIPLE GENERATING STATIONS.*

By JOHN F. C. SNELL, Borough Electrical Engineer, Sunderland.

THIS question is one by which doubtless many of us will be met, especially those engineers in charge of direct current central stations, though the question will doubtless also affect to a less degree those supplying alternating current. There is no doubt that too little care has been taken in many cases to gauge the extent of the demand which will be made upon supply stations, and one finds small sites adopted in many cases, or small stations put down without seemingly any regard for future extensions or future uniformity of design. While, on the one hand, it is imperative for the well being of these undertakings to keep down the capital cost per kw. installed, on the other hand, it is foolish and ill advised to pay no heed to the future, and to design the station initially, so that extensions may not be made systematically, and the result be a credit to the designer in the future, and, at the same time, economical to the municipality which he represents.

One cannot overlook the insignificance of many of our stations at the present day compared with, as the author thinks, the dimensions they must attain in the not remote future, and the question which each engineer will have to consider, will be, shall the whole town plant be centralised upon one site (which in most cases would have to be extra-mural) or shall there be several supply stations at different points? The author commenced these notes before the question was raised, at the late Parliamentary Committee and before it had begun its deliberations, and it is interesting to note, that while engineers generally admit the safety of extra high pressure supply, many of the most eminent admit that multiple stations have great advantages. The whole question is determined by the following points:—

1. The critical limit of H.P. installed from the point of economy.
2. Economical generation.
3. Efficiency of distribution.
4. Load factor.

Critical Limit of H.P.—This has been satisfactorily determined by Dr. Alexander Kennedy in the discussion on Mr. Ellington's paper on hydraulic power supply, read before the Institution of Civil Engineers in 1894. The Professor there states that he has found this critical limit to lie somewhere between three and five thousand H.P. installed (Mr. Ellington's limit being much lower) and once this limit is reached, it is just as economical to build another station, as to go on increasing the capacity of the first. This point being conceded, the questions of site, nuisance, and economical generation will be considered below. The author's opinion is, that given sites obtained with economy and carefully chosen, that this principle of multiple stations is the right one, inasmuch as other factors, such as additional safety and reduced capital outlay on mains, and increased efficiency in distribution are thereby obtainable.

Economical Generation.—It is impossible, of course, to lay down any standard on which a town supply can be based. But no doubt the ideal to be aimed at is a direct current system, with its simplicity, availability for power purposes, possibility of storage (which we may hope will yet greatly improve) and its undoubted reliability; condensing plant with its added efficiency, reduced charge for water and boiler cleaning; and a convenient position for economically obtaining coal. It is impossible, except in rare cases, to obtain these advantages as it were naturally, *i.e.*, to find a site, at once alongside of water, and a railway siding. By far the greater number of towns will have to adopt auxiliary means for cooling circulating water, if they must needs obtain the advantages of condensation, and it would therefore seem that in many cases it is unnecessary to build stations outside a town, the only factor against this being the increased cost of the sites in more central positions, but which may well be outbalanced by the cost of mains to various sub-centres, when one generating station is adopted. In the City of London no doubt, the case is a specially peculiar one, but in the other large cities and towns there are plenty of available sites which would be easy to obtain, where the station may be practically erected *on* the mains it supplies. The question of a slight charge on the coal for cartage, or even the much more pronounced one of condensation, may be much outweighed by the inefficiency of the distribution. That a site situated by a river, for example, where surface condensation may be obtained, is one of the greatest blessings that a station can have will be admitted, but not so if a system has to be adopted which entails an inordinate price for trunk mains and repeated transformation.

Distribution.—It may be taken as an axiom, that simplicity of distribution is desirable, and even necessary, and we shall find that out more and more as time goes on, also that the lower the pressure adopted, consistent with economy, the safer and more reliable the supply. One does not want to rake up the old discussion of the pros and cons of alternating and direct currents, but let these remarks apply to all stations of both classes; therefore, from these points of view alone, multiple stations with simple radiating feeders appear to provide the simplest system obtainable. It cannot be overlooked that the amount of conductors radiating from one huge extra-mural station, would sometime become enormous, and expensive culverts would have to be constructed.

Capital Costs.—Multiple stations are not any dearer to construct than single generating stations, for if one analyses the costs of one of the London companies, or municipal towns having multiple stations, and bears in mind the relative miles of streets covered by their distributing mains, one will find very little difference in the cost of the two systems at this earlier stage, and one may venture to say that the difference as the load increases will be in favour of those stations which are fixed directly on the centre of gravity, as it were, of the system which they supply.

Load Factor.—There does not seem to be much in this point. If anything there is a chance of a better load factor at several stations than with one large and distant one. Take a system which is supplying light and power, and supplying tramways, there can be no doubt that the system will have a better efficiency of distribution when several stations are erected; will be better able to deal with the requirements of the tramways and leakage; and better able to solve the problem of the decreasing space in the streets available for mains. The load factors of Glasgow and Liverpool, with multiple stations, or at Westminster, are as good as towns of equal importance where the whole supply is from one station, and the proportion of maximum load to plant installed much the same. So there is not much in that argument against multiple stations.

Nuisance.—Objections which may be raised to intra-mural stations are:—

1. Cartage of coals and ashes.
2. The absence of natural means of condensation of steam.
3. Smoke nuisance.
4. Vibration.

(1) The extra 8 or 9 per cent. payable on coal for cartage (as may happen in the case of multiple stations), may be much more outweighed by the decrease in efficiency of distribution when the station is outside the town, added to which must be the interest on the capital cost, which the extra mains entail.

(2) *Condensation.*—This has been touched on before, and, as has been said, probably the majority of stations in future will have to provide artificial means for dealing with the circulating water if condensation of steam is to be adopted. Those stations which have some natural source, such as a river or the sea, will no doubt have the advantage, and he would be unwise who would omit to sieze these opportunities, if they are at all possible. The saving which may be obtained from the reduced consumption of steam, and consequently of coal, the absence of any charge for feed-water, and the less cost of cleaning the boilers are the advantages. Doubtless, therefore, there are cases where the economics of this problem can be better met by centralising the plant (probably in the future this may mean three-phase plant), where this great engineering advantage of condensation can be obtained, and the supply re-distributed from multiple sub-stations.

Vibration.—This point which has been raised as a deterrent to the adoption of stations inside certain towns is one which, with care in dealing with the foundations and formation on which the station is erected, and by the adoption of three-crank engines, can be neglected. Atmospheric exhaust vibration is a matter which can be easily got over by exhaust silencers, or, of course, by adopting condensing plant.

Smoke Nuisance.—This point is mentioned because often brought forward as an argument for extra-mural stations. One may confidently say that in these days there are few of us who would care to admit that our stations would be complained of from this point, and with careful stoking and management the smoke nuisance is more visionary than real.

To briefly summarise, the actual problem we are confronted with, is that a station already exists, and we have to extend with both financial and engineering success, and our respective committees will not care about large alterations being ultimately made by the substitution of existing plant by other systems. The most natural method therefore seems to be this, to prospect new areas by high tension direct current machinery, where possible, with sub-stations feeding into low tension networks, the latter so designed that ultimately they may become part of the general network into which the second or more stations will ultimately feed, these taking the place of the temporary sub-stations.

This paper contains nothing new, and is intended merely to be a basis on which the arguments for and against the principle enunciated may be thrashed out, and I must apologise to the members of the Association for what may well be considered a plagiarism.

MANAGEMENT OF ELECTRICAL UNDERTAKINGS BY LOCAL AUTHORITIES.*

By Councillor HESFORD, Ex-Chairman of the Electricity Committee of the Southport Corporation.

IT calls for no great demand upon our credulity to-day to assume that electrical undertakings can be efficiently administered and profitably managed by local authorities.

* Read June 8th.

We have evidence of this sufficient to convince the most sceptical, even Government departments. Yet, with such evidence plainly before us, the anomaly remains that of the total number of provisional orders annually obtained, many drift into and dwell for years in the regions of the doldrums. Here pessimistic majorities love to dwell until leavened by the optimists when the good ship soon finds its way into the trade winds. Having arrived in such active sphere, committees generally exhibit a desire to understand something of the work they are called upon to do. Nay, their zeal is generally worthy of emulation by every manufacturing committee of corporations. Some are even as jealous as the boy who took the bellows to pieces to see from whence the wind arose. It is a new thing, is a common remark, and who does not like to see and hear of something new.

Having taken their decision to establish a station, alas, difficulties face them at all points. Shall an engineer be at once engaged to design and subsequently work the station, or is it better to call in the advice of some consulting engineer to advise and plan. To approach the makers of machinery at this point, as private individuals do in building factories and works, is rank corporate heresy. On such a mementous question members seek advice from those of their friends who have already gone through the mill. But here diversity of opinions is the bewildering fruit of their efforts. Every committee know what they want. It is a station and system of distribution that shall be second to none. It must be planned for utility and convenience, and meet the unknown wants of futurity. Its machinery should be designed to adapt itself with precision and success to all the varying requirements, work at a cost that shall top the record, and be obtained from the lowest tenderer. These are the ideals, and the question is how to get them.

Friends tell us privately that consulting engineers are divided into schools, and that somehow or other their district will be found to be well suited to the particular system that the engineer called in generally advises. The advantages of such system are explained and made manifest, whilst the disadvantages of others are clearly portrayed.

Having read or remembered something of the battle of the gauges fought by railway engineers in the first half of this century, and its termination by the evidence of convenience, members of committees subside into despair of being able to give a clear reasoned decision on any system. In this condition the influence of persuasive oratory generally prevails and soon seals their capture.

An engineer is engaged and a suitable system declared.

Should the committee continue in the jelly-fish condition produced by abundant and earnest advice of opposite polarity, they will be spared the distractions of listening to the arguments of Lancashire *versus* water-tube boilers, or high speed *versus* slow speed engines, one advantage of being in a plastic condition of mind. The station being now completed, committees for a time at least are rid of their perplexities and difficulties. This is for a short time only. Errors in design and equipment soon make themselves apparent. Our buildings are too narrow or too short is a frequent cry. But that much belauded day plant is the dilemma of most committees. Having been at work a year or two it leaks out gradually that the small unit specially advised for economical day load work is too small, and of insufficient power in some cases to energise the transformers alone.

We are advised to sell them, but to whom? If the Asiatics could be induced to take them as readily as they take modern rifles, what a relief to corporations and benefit to the buyers it would be. The advice is frequently given to sell this or scrap that, often advisable and perfectly sound from a business point of view, must or ought to bring to every committee the concomitant duty of making a reserve fund, out of which the unpaid sinking fund on such plant can be met.

But the primary and foremost duty of committees having stations under their control, ought to be the production of electrical energy at the lowest possible cost. None need be at loss for a standard whereby to measure such costs. With the excellent and up-to-date tables in *Lightning* the failings of every station becomes apparent. Certainly few, if any, can excel in every item of costs in the group into which they as measured by output fall. All can, however, try to stand well by comparison where skill and forethought in design and equipment, as well as management make themselves felt.

The policy of willingness to lay cables to supply proposing or likely customers has hitherto been attended with general success. Of the day when it will become the poor man's light, we all anxiously await the dawn. Whenever the cost of distribution can be cheapened considerably that day will have arrived. Everyone connected with electricity committees remarks on this at present very costly process.

Street Lighting.—Electricians all advise, and wisely no doubt, the lighting of our streets with electricity. What a smug satisfied look would pass over the face of every corporate electrical engineer if he could obtain it.

The nice 3,000-hour load factor would delight him. How is this desirable change to be brought about. The prize is worth every effort. But all here know that corporate gas committees are tough thick-skinned gentlemen. The one lever that would be rapid and successful in gently lifting them from their commanding position is the one of less cost. Bring that about by whatever means you like, and the object of our desire is attained.

Charging.—No paper on management would be complete without reference to the prices charged. In this matter corporations stand well in comparison with private companies. By a large and constantly increasing number the Wright system of charging is finding favour. Personally, I am strongly in favour of retaining the maximum price, intact, setting the time limit of such price to suit the circumstances of each locality. For all energy consumed beyond the time of maximum price, I would drop it to the lowest possible charge consistent with covering all charges.

A reserve fund I deem a necessity.

In a word my policy would be one of charging the lowest price the system will bear, rather than the one that generally obtains in the gas world of charging the maximum that the public will quietly consent to pay. In conclusion, as an earnest member of committee, let me add that it will be the opening of a grand day for the popularity of electric lighting, when the greater portion of the capital, energy and resource now expended by electricians on various schemes for improving steam engines and boilers, shall be spent on the cheapening and perfecting of the means of distributing energy for lighting purposes. An average of from £8 to £10 per connection is a very heavy capital charge to carry.

The interest and sinking fund on this amount is equal to one-third the annual cost of light in cottage houses.

Nor as a member of a corporation can I ignore the fact that the calamities that we were almost passionately pressed to anticipate and guard against by the expenditure of capital on duplicates have not generally shown themselves in practice.

Accepting the press as my authority, the major portion of failures in lighting have occurred in consequence of weakness or defects in the distributing plant.

Our boilers, steam pipes, and engines have not failed so often as the underground portions of our systems. It is on this portion of the plant that members of committees entertain a fear, that is fruitful of halting and indecision.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

THE DESIGN OF ELECTRIC RAILWAY MOTORS FOR RAPID ACCELERATION. By Prof. CHARLES A. CARUS-WILSON, Member. Read May 26th, 1898.

(*Continued from page* 785.)

From equation 16 we find the accelerating current to be 30 amperes; so that the total current at starting is 45 amperes, assuming that the induction factor remains constant throughout. These results are shown in fig. 5. Horizontal ordinates represent time in seconds, and vertical ordinates speed in feet per second, and also amperes.

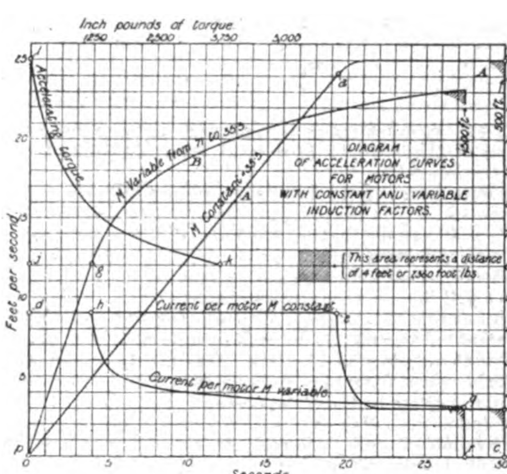

FIG. 5.

The acceleration is 1·25 f.p.s. per second, and can be kept constant until the starting rheostat is all out. The speed at which this takes place can be found from equation 6, by inserting the known value of $\frac{M\ v}{d}$, and putting $E = 500$, $R = 0{\cdot}6$, $C = 45$. We find that the speed is 24·2 f.p.s., or 97 per cent. of the final speed. The error involved in assuming that the acceleration is constant up to full speed does not amount to 1 foot of distance. From the figure we see that half the distance is covered in 20 seconds during the process of accelerating, and the remaining 250 feet is covered at full speed in 10 seconds. The whole area of the curve $p\ a\ b\ c$ represents 500 feet.

The maximum current, 45 amperes, is constant up to the point a, when the starting rheostat is all out. This is shown by the current-curve. At the point e on this curve, corresponding to the point a on the acceleration curve, the current will rapidly diminish; the form of the curve has been calculated and plotted in the figure.

We must now consider the influence of series winding on the curves of current and acceleration. In fig. 6, let values of the current be measured horizontally, and values of the induction factor be measured vertically. Take $a\ h$ equal to 15 amperes, and set up $h\ b$ equal to 35·5 on the vertical scale. Then b is a point on the induction curve of the motor. For, whatever are the values of M for large currents, the value of M for 15 amperes must be 35·5 in order that the motors may run at the required rate at full speed.

Take $a\ g$ equal to the maximum current, 45 amperes. Produce $a\ b$ to cut a vertical line through g in c. The greatest possible induction factor the motors can have at 45 amperes is given by $g\ c$, equal to 106 on the M scale. For the induction curve of a series-wound motor cannot be convex to the axis of current, though it may be a straight line passing throughout the origin if no part of the iron in the magnetic circuit is magnetised over the bend of the magnetisation curve. We have shown in this case that the induction curve must pass through the point b; hence the greatest possible value of M for these motors is found by making the induction curve a straight line passing through b, giving us a maximum induction factor of 106.

Our calculations hitherto have shown us that the motors must have an induction factor of 35·5 at 15 amperes, and that the maximum current at starting must be 45 amperes. We have not, however, determined the value of the induction factor at 45 amperes. All we know is that if M is constant, and equal to 35·5 for all currents, we shall cover the given distance in the given time.

It is clear that there are an infinite number of possible induction curves, all passing through the point b, having different values of M for 45 amperes, all less than 106. Any one of these curves would

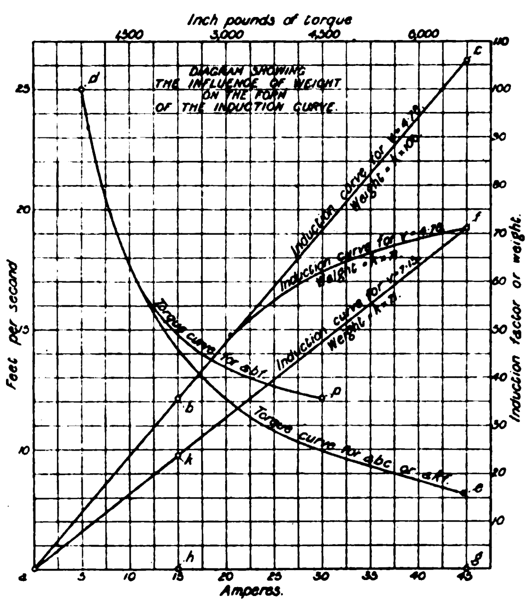

FIG. 6.

comply with the specification as to time and distance, but we shall see that none of them would be so good from the point of view of economy as the line $a\ b\ c$.

When the maximum current to be carried by a motor is fixed, the weight increases nearly in proportion to the induction factor for that current. We shall assume that for any current the weight is given by k times the induction factor for the current, where k is some constant. Hence, of all induction curves that might be chosen, that given by $a\ b\ c$ will involve the greatest weight.

Let us suppose that the practical considerations of space and cost limit the weight of the motors in this case, so that the maximum value of M for 45 amperes is 71—twice that for 15 amperes. The induction curve must then pass through the points $a\ b\ f$; let the curve $a\ b\ f$ in the figure be the curve chosen.

From the induction curve we can construct a curve giving the total torque available for all purposes. In the figure this is drawn at $d\ p$, horizontal ordinates giving torque in inch-pounds on each motor axle, and vertical ordinates speed in feet per second. By deducting from the horizontal ordinates of this curve the torque required to overcome the retarding forces we obtain a curve of torque available for acceleration. This curve is reproduced at $l\ k$ in fig. 5; it cuts the speed axis at 25 feet per second.

We can now construct the acceleration curve for the series-wound motors. The maximum total torque is 4,500 inch-pounds; deducting 750 inch-pounds for the retarding forces, assumed to remain cons'ant at all speeds, we get an initial acceleration of 3·12 f.p.s. per second —more than twice that obtained when M was constant. The speed of the car when the rheostat is all out is 12·1 f.p.s.; this speed is reached in about 4 seconds, and is shown by the point g. From p to g the acceleration is constant. The form of the acceleration curve beyond this point has been found by graphic construction, and continued up to the point at which the area, as obtained with a planimeter, is equal to a distance of 500 feet; this is at 27·5 seconds from the moment of starting.

The current curve has also been drawn. The maximum current is passing for 4 seconds, after which time the current decreases; the value at any time being obtained from the acceleration curve by using equation 6. An examination of the curves in fig. 5 shows that the effect of increasing the induction factor by series winding has been to decrease slightly the time required to cover the given distance, the saving of time in this case being 2·5 seconds.

If we compare the acceleration curves for the constant and variable induction factors, we shall see that the series-wound motor gains in distance up to the point at which the curves cross one another, and after this point loses in distance. If the distance gained is equal to that lost, there will be no difference in the time required to cover a given distance. This may often happen. The form of the acceleration curve depends upon that of the curve of accelerating torque. If this is nearly straight between k and l, the acceleration curve will rise up steeply, and the gain in time may be considerable. If, on the other hand, the torque curve is very much bent, the acceleration curve will bend over rapidly, and the series-wound motor will take a longer time to cover the given distance than one with constant induction factor.

The form of the torque curve depends on that of the induction curve. Hence, the straighter we can make the induction curve the shorter will be the time required to cover the given distance.

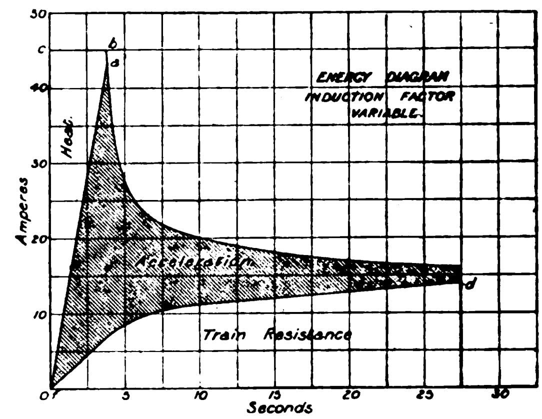

FIG. 7.

A ratio of maximum to minimum induction factor of two to one is very commonly obtained, and in such a case the series-wound motor may show a gain of 5 to 10 per cent. in the time occupied. We have, then, a reason why the induction curve should be as straight as possible.

The energy expended in covering the given distance is shown in each case by the area of the current-curve. A glance at the diagram is sufficient to show how great a saving is effected by the use of the series winding.

The two current-curves have been reproduced in figs. 7 and 8. If we multiply the vertical current ordinates by the tension of the line, we may take these to represent watts instead of amperes. At the point f the whole of the energy is being expended in heat. The heat loss at any point may be calculated by finding the speed and the resistance in the circuit, and then multiplying this by the square of the corresponding current. If the heat watts is divided by the tension of the line, we obtain the part of the total current that represents the loss due to heat.

When the current representing the heat loss has been deducted from the total current at any instant, the remainder represents the expenditure of energy in producing acceleration and overcoming train resistance. The proportion of these two can be obtained from the curve of total torque, since that tells us how much is being used for accelerating, and how much for overcoming train resistance at any speed.

The curves $o\ a$ and $o\ d$ in figs. 7 and 8 have been constructed in this way, thus dividing the whole area into three portions, representing respectively the energy used in heating, in accelerating, and in overcoming train resistance.

In comparing the two diagrams we see that the areas giving the energy used in overcoming friction must be the same; for the distance

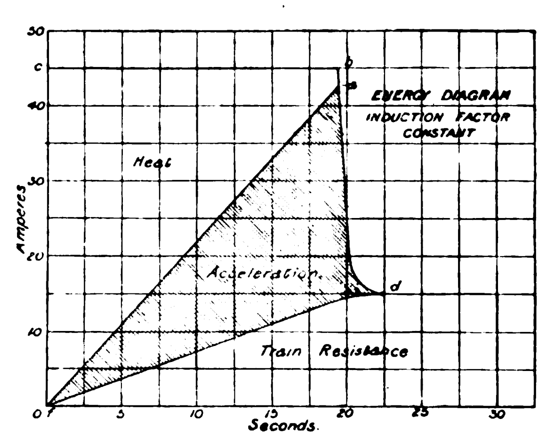

FIG. 8.

is equal, and so is the frictional resistance to motion. In this case the energy thus expended is, by calculation, 109 thousand foot-pounds.

Since the final speeds in the two cases are respectively 25 and 23·2 feet per second, the kinetic energy for the motors with constant and variable induction factor will bear to one another the ratio of the squares of these numbers. The values are, by calculation, 109 and 86·7 thousand foot-pounds. There is thus a small gain in favour of the series-wound motors, owing to the fact that the final speed is less than with the motors with constant induction factor.

It is, however, when we come to consider the areas representing the heat loss that we see wherein lies the great advantage of the series winding. The energy expended in heating with the motors having constant M is more than five times that expended with the series-wound motors, the actual values being 32·2 and 169 thousand foot-pounds respectively.

Examination of the diagram shows that the area giving the heat loss is very nearly one-half of the area of the current-curve up to the point at which the starting rheostat is all out. Now, the effect of the series winding is to reduce the time during which the starting rheostat is in the circuit. And this reduction is brought about in two ways. First, the speed at the point when the rheostat is all out is reduced in direct proportion as M is increased. Second, the increase in the initial acceleration sets back this point still further. Thus, in fig. 5, the point a gives the moment when the rheostat is all out with constant M. The speed is 24·2 f.p.s. If M at the start is doubled, owing to the use of series winding, the speed is reduced to 12·1 f.p.s., and the point g then still further set back, so that the time is reduced from 20 seconds to 4 seconds.

Since the speed when the starting rheostat is all out varies nearly inversely as M, and the initial acceleration varies nearly directly as M, the area giving the heat loss varies nearly inversely as the square of the induction factor at the moment of starting.

By increasing the induction factor indefinitely we could reduce the heat loss to that due to the resistance of the motor only; in other words, we could do without the starting rheostat altogether. The reason why we are unable to do this is because the maximum possible value of M is determined by the form of the induction curve. Thus, we have seen in fig. 6 that in this case the greatest possible value of M is 106. If the weight involved in using this value of M were not an objection, we could reduce the heat loss to 13,000 foot-pounds. Such a value for M would, however, be inadmissible, on account of the cost of construction and the space taken up, and we have to be content with a loss two or three times this amount.

A reference to fig. 5 shows that the points, such as a and g, where the rheostat is all out lie on a curve passing through the origin. This curve is nearly a parabola, whose horizontal ordinate varies inversely as M^2. It is thus evident that, the more the heat loss is reduced, the greater will be the increase in M required to effect any further reduction; so that there is a point at which it is not worth while increasing the weight of the motor, the saving effected not being large enough to compensate for the disadvantages of the heavier motor.

The following table shows the expenditure of energy in foot-pounds in the two cases:—

	Constant induction factor.	Variable induction factor.
For acceleration	109×10^8 ...	$88{\cdot}7 \times 10^8$
For train resistance	109×10^8 ...	$109{\cdot}0 \times 10^8$
For C^2 R loss	169×10^8 ...	$32{\cdot}2 \times 10^8$
	387×10^8	$229{\cdot}9 \times 10^8$

The expression "train resistance" means here all forces opposing the motion, including those due to the friction of the gearing and the torque lost in the motor itself.

Referring once more to fig. 6, we have seen that the induction curve of the motors must pass through the point b, and that if the maximum value of M is limited to 71 the induction curve must be bent so as to pass through the point f.

If now the velocity ratio employed can be increased, in the ratio of 71 to 106, or—what would come to the same thing—if the diameter of the driving wheel can be decreased in the same ratio, the induction factor at 15 amperes must be reduced to 23·8, so that the final speed may remain unaltered. Let $h\,k$ equal 23·8 on the M scale. It follows that a straight line through a and k will cut the vertical line through g at f, where $g\,f$ is equal to 71 on the M scale.

We have thus made our induction curve pass through the point of maximum M for 45 amperes, and $a\,k\,h$ is the best induction curve from the point of view of economy. We have done this by simply increasing the velocity ratio and altering the inclination of the induction curve to the axis of the current. This inclination will depend upon the permeance of the air-gap if the iron circuit is unaltered. Hence, by rightly proportioning the gap and the velocity ratio, we can obtain results approaching very nearly to the greatest possible economy.

Since $h\,k$ in fig. 6 is equal to $0{\cdot}1747\,\frac{e\,t\,d}{\mathrm{D}\,v}$, and $a\,h$ is equal to $2{\cdot}03\,\frac{\mathrm{T}\,\mathrm{D}}{e\,t}$—T being the retarding force in pounds at the car axle—the tangent of the angle $k\,a\,h$ is given by

$$\tan k\,a\,h = 0{\cdot}086\,\frac{e^2\,t^2}{\mathrm{T}\,\mathrm{D}^2}\,\frac{d}{v} \qquad (18)$$

Hence we can write,

$$p\,\mathrm{A}\,\mathrm{S}\,g = 685 \times 10^4 \times \frac{e\,t^2\,d}{\mathrm{T}\,\mathrm{D}^2\,v} \qquad (19)$$

where p is the numerical constant defined on page 1, A is the number of surface conductors, S is the number of turns per pole in the series winding, each carrying the whole current, and g is the permeance of each polar gap in centimetres.

It will generally happen in practice that the weight limit requires a velocity ratio that is unattainable even with the largest values of d. We have here a difficulty that influences greatly the design of railway motors when spur gearing is employed, namely, the limited clearance between the gear wheel and the ground. We have to get the largest value of v with the smallest value of d. It is obvious that the greatest possible ratio of v to d is determined simply by the clearance.

(To be continued.)

ELECTRICITY AND THE WAR.

The interest in the war is well maintained in the columns of our American electrical exchanges. We have already stated the opinions of two journals regarding the probable effect of the war upon the electrical business in the States. It was considered that the war would place the electrical trade in a bad way eventually. The New York *Electrical Review* seems to take an entirely different view. It says that the only apparent effect of the war on the electrical industry in the United States has been to set the majority of the manufacturing plants running day and night. The wire and cable companies are overburdened with orders, chiefly from the Government. Makers of dynamos, motors, searchlights, ship-lighting sets, and small supplies are also unusually busy. Many of these companies are working short-handed in their administrative forces, owing to the fact that a considerable number of their people have volunteered their services to the Government in various capacities. The war will result in profit to the electrical industry, and the electrical fraternity has been and will be of invaluable assistance to the Government.

It is interesting to note that among the officers attached to Dewey's squadron was Lieut. Bradley Fiske, who is well known to the electrical fraternity as the inventor of the Fiske range-finder, and for his electrical work in other directions. Lieut. Fiske was on the *Petrel*, and it was his ship to which the task was assigned of destroying the remnants of the Spanish fleet after the battle was over.

It is to be hoped that the volunteer electrical corps, which is being rapidly organised by Capt. Eugene Griffin, Dr. Louis Duncan, Lieut. F. J. Sprague, Lieut. O. T. Crosby, and others, will not be placed on the same footing as other volunteer corps recruiting for other purposes. The electrical volunteers' immediate superiors will be men in his own line of work, whose ability he recognises. Our New York namesake remarks, "The volunteer electrical corps does not and need not know military tactics—it must and does know how to handle a pair of pliers."

In connection with the war news it is interesting to print the following telegram sent by President McKinley to the Electrical Exhibition, on its opening in Madison Square Garden, New York, early last month:—

"It gives me pleasure to open the Electrical Exhibition in Greater New York, and to participate in this demonstration of the latest method of transmitting, recording, and publishing by means of electricity. I congratulate you upon the achievements of American genius. I am glad to know that the resources of the wonderful electrical arts have already been so far advanced in the United States, that American electrical goods are welcome the world over."

In regard to the action of Admiral Dewey in cutting the telegraph cable at Manila, the New York *Electrical Engineer* says: "He cut the cable, but what a grand thing it would have been if he had had with him some good cable men who could have taken hold of the cut end and kept one of his ships in touch with the outer world." The battle of Manila offers an illustration of the wisdom of having experts in telegraphy and electrical engineering attached to every army or fleet. "If the electrical end of Commodore Dewey's establishment had been cared for as scrupulously as its strictly fighting end, he could have made his victory even more complete in its moral effect by showing the Spaniards the hopelessness of a war against so ingenious a people as ours. There is one brilliant electrical engineer with the Dewey fleet, Lieut. B. A. Fiske, but he is helpless while the cable lies at the bottom in deep water, for of all the ticklish things to hold and raise a heavy cable is about the worst."

On the legality of Admiral Dewey's act, the *Western Electrician* says:—"It is generally held that all nations reserve to themselves the right to cut submarine cables in wartime as a military necessity or belligerent right, but it is possible that a civil claim for damages to the service may be admitted."

At the request of Lieut. Maxfield, U.S.A., the Government censor, all the foreign employés in the offices of the United States and Hayti Cable Company in New York have been "laid off" from the company's service, their places being filled by native-born American citizens.

HEAVY MOTOR VEHICLES AT LIVERPOOL.

Not much attention has been accorded to the trials of motor vehicles made recently at Liverpool by the local Self-Propelled Traffic Association, the object being to arrive at a type of heavy motor waggon suitable for trade requirements in and around Liverpool. Though entries were numerous, only six British vehicles were entered, and all the Continental vehicles were excluded by the 3 tons limit of the Light Locomotive Acts of 1896. Only four vehicles finally competed, yet they attracted a good deal of local interest, and numerous light motor vehicles were employed in carrying judges and others over the course.

All the competing vehicles were steam-driven; there were no oil or electrical vehicles, though oil was represented well among the light attendant carriages, all of which were sent by the Daimler Company of Coventry.

Two exhibits came from the Steam Carriage and Waggon Company of Chiswick. No. 3, of Class II, which comes under the figures of minimum load 5 tons, minimum average speed 4 miles an hour, minimum platform area 110 square feet. It was carried on 6 wheels, and is described by the *Times* correspondent as resembling a traction engine with attached waggon. It and its smaller companion, No. 4, had water-tube boilers and an air condenser. Vehicle No. 1 was sent by the Liquid Fuel Company, of East Cowes. It was entered under

Class I., minimum load 2 tons; minimum speed 6 miles per hour; platform area, 60 feet. It ran 35 miles in 5 hours inclusive of all stops, a very creditable performance.

The Lancashire Steam Motor Company, of Leyland, were the owners of the fourth vehicle, which carried 4 tons, and was built for 6 miles per hour, and was carried on 4 wheels with a steel frame, and the boiler is below the platform. Its steel tyred wheels gave a deal of trouble, so that on the third day it did not turn out. Gradients of up to 1 in 20 were found on the various trial routes selected, and a report is promised at an early date. Present appearances point to the heavy motor car traffic being monopolised by steam-driven vehicles, whereas for light cars oil motors seem best, though for city work on smooth pavements electricity holds the place, as evidenced by the London electrical cabs, which still seem to be running satisfactorily and regularly, being daily in evidence all over the city and west end.

Had it not been for the hampering restrictions regarding road locomotives, the motor vehicle industry would to-day have been in a flourishing condition, and it would not have passed through the undesirable phase of company promoting, which has so much retarded honest development.

NEW PATENTS AND ABSTRACTS OF PUBLISHED SPECIFICATIONS.

NEW PATENTS.—1898.

Compiled expressly for this journal by W. P. Thompson & Co., *Electrical Patent Agents*, 322, *High Holborn, London, W.C., to whom all inquiries should be addressed.*

11,570. "Improvements in or connected with electrolytic cells." G. Bell and G. W. Bell. Dated May 23rd.

11,579. "Improvements in electric signalling on railways." J. W. Wadkin and D. J. Jarvis. Dated May 23rd.

11,604. "Improvements in or connected with the electro-metallurgic production of iron steel and their alloys with chromium tungsten, nickel, manganese and the like." E. Stassano. Dated May 23rd. (*Complete.*)

11,609. "An improvement in electrical fuses and cut-outs chiefly applicable to the bridge fuse." A. W. Sowry and H. E. Munslow. Dated May 23rd.

11,610. "An automatic electrical temperature indicator." A. H. Wood and D. M. Hayllings. Dated May 23rd.

11,627. "Improvements in electric cables." W. S. Smith. Dated May 23rd.

11,640. "Improvements in accumulators or secondary batteries, and apparatus for their manufacture." F. Heimel. Dated May 23rd.

11,678. "Improved apparatus for use in the electro-deposition of metals." W. Dunn and W. J. Twining. Dated May 23rd.

11,723. "Improvements in and relating to the making and breaking of electric circuits." J. A. Steven and C. Hamilton. Dated May 24th.

11,730. "Smethurst concentric ceiling rose." A. A. Smethurst. Dated May 24th.

11,731. "Improvements in the globes of electric incandescent and similar lamps." English Industrials, Ltd., and G. E. Heyl-Dia. Dated May 24th.

11,732. "Improved means for measuring current or voltage in electric lamps." English Industrials, Ltd., and G. E. Heyl-Dia. Dated May 24th.

11,757. "An improvement in jointing or junction boxes for connecting, distributing, and the protection of electric wires." T. McEwan. Dated May 24th.

11,773. "Improvements in connection with permanent magnets." C. Thompson. Dated May 24th.

11,783. "Improvements in and relating to conductors for electric railways." H. H. Lake. (W. A. P. Willard, jun., United States). Dated May 24th. (*Complete.*)

11,858. "Improvements in the manufacture of elements or plates for secondary batteries or electric accumulators." F. King. Dated May 25th.

11,860. "An improved means for making and breaking electric circuits." A. W. Saubbrey. Dated May 25th. (*Complete.*)

11,880. "Improvements in, or relating to, coils for heating by electricity." A. Cleaver. Dated May 25th.

11,906. "Improvements in, or relating to, fuseboards." A. Vandam and T. H. Marsh. Dated May 25th. (*Complete.*)

11,917. "Improvements in means for silvering or plating the glass bulbs of incandescent electric lamps, or the like." F. Fanta. Dated May 25th.

11,922. "Improvements in electric lamps." A. A. C. Swinton. Dated May 25th.

11,924. "Improvements in electric lamps." W. Peto. Dated May 25th.

11,926. "Improved circuit connections for continuous current shunt machines." A. Sengel. Dated May 25th.

11,936. "Improvements in electric arc lamps." R. Gaynor. Dated May 25th.

11,989. "Improvements in, and relating to, telegraphic transmitting and recording or receiving apparatus." J. C. Mewburn. (B. Hoffmann, France.) Dated May 26th.

12,011. "Improvements in electric gas-igniters." F. Dreimel, J. Lehmann, and A. Sylten. Dated May 26th.

12,013. "Improvements in printing telegraphs." L. Kamm. Dated May 26th.

12,016. "Improvements in systems of electrical control." H. H. Leigh. (F. J. Sprague, United States.) Dated May 26th.

12,019. "Manufacture of active material for accumulator batteries." H. Tobler and J. H. Graeber. Dated May 26th. (*Complete.*)

12,049. "Improvements in electrical resistance coils." S. W. Outtriss. Dated May 26th.

12,092. "Improvements in electric bells for cycles." A. R. Gould. Dated May 26th.

12,106. "A new or improved electrical appliance for curative or remedial purposes." H. Krauss. Dated May 26th.

12,172. "Improvements in electric arc lamps." K. Panian and M. Bernhard. Dated May 28th.

12,175. "A new or improved composition for the manufacture of carbon pencils for arc lamps, incandescent filaments, and the like." C. Schnabel. Dated May 28th.

12,190. "An improved chemical composition intended for the manufacture of mantles or blocks for use in electric arc lamps." P. Mersch. Dated May 28th.

ABSTRACTS OF PUBLISHED SPECIFICATIONS.

Copies of any of these Specifications may be obtained of Messrs. W. P. Thompson & Co., 322, High Holborn, W.C., *price, post free*, 9d., (*in stamps*).

1897.

17,924. "An improvement in field magnets for electric generators and motors." C. Tuson. Dated July 30th, 1897. This invention relates to the construction and winding of a field magnet, so that the coils employed can be easily wound ready to be put in place. A hollow cylinder of steel is made with deep recesses in its ends, leaving an internal shell cut away at each side to leave opposite pole pieces. Two insulating wires are wound, each forming a complete ring. Each of these rings have their sides introduced at both ends into the recesses and are passed through the cylinder. They cross each other on each side of the cylinder and when electrical currents are passed through the rings the cylinder is rendered magnetic, and the inner face on one side being of one polarity, and the opposite face being of the opposite polarity. 1 claim.

18,276. "Improvements in electric lamps for miners' use." H. H. Lake. (Communicated by O. Siedentopf.) Dated August 5th, 1897. This relates to a novel arrangement of terminal openings, and of protecting the dome; covering the lamp bulb. The protecting dome is of glass and is hinged upon the casing of the lamp in such a manner that it swings downwards when opened, so that the lamp can be readily replaced. It also covers the terminal openings for charging the secondary battery in the lamp; as they are arranged upon the front of the lamp so that when the dome is closed the contact pieces are prevented from becoming dirty. 2 claims.

1,996. "Improvements in electric rollers for therapeutical and massage purposes." J. W. Gibbs. Dated January 25th, 1897. Date applied for September 22nd, 1896. This invention is an electric roller consisting of a central body provided with axial bearings for the handle. There are a series of contiguous generating face-plates, as copper and zinc, around the centre of the body. The face of the roller is smooth and a circuit is established by the moisture of the body upon application. 2 claims.

13,268. "Improvements in electric mountain railways." E. Andre. Dated May 28th, 1897. This relates to a device for increasing the tension of the dynamo during the down journey without dangerously increasing the speed of the car. There is an arrangement enabling the motor to act as a dynamo, irrespective of the kind of current used, and to impart current to the line wires by increasing the number of revolutions. There is also an additional dynamo adapted, to be connected up with the motor in series, in order to increase the tension of the latter by means of its own tension and to act at the same time as a brake. 2 claims.

17,824. "Improvements in electric alarms for cars." A. Nathan. Dated July 29th, 1897. This invention consists of a vertical shaft, at the upper end of which is pivotally connected a spring-supported lever, provided with an arm directed downwards, mounted on the shaft, below the lever is a vertically movable disc supported by springs. To this disc there is fastened a tubular insulating sleeve, which is free to move up and down the shaft with the disc. At the bottom of the sleeve is fastened a plate. Below this is another plate mounted on the shaft by an insulating sleeve rigidly fixed. There is an electric bell in circuit with these plates, and when the lever is pressed down the plates touch, which closes the circuit and operates the alarm. 3 claims.

5,131. "Improvements relating to electrical resistances." E. W. Bowles. Dated March 25th, 1897. This relates to liquid resistances to prevent waste of electro motive force when resistance is not required. The resistance is short-circuited by adapting to the appliance which carries the movable pole plates, contact pieces, which, when the pole plates are together, come into electrical connection with the fixed contact pieces in the circuit, and bridge over the space between such contact pieces. 1 claim.

THE

ELECTRICAL REVIEW.

VOL. XLII. | JUNE 17, 1898. | No. 1,073.

CONTENTS:

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON.

Telegraphic Address: "AGEEKAY, LONDON." Code A B C.

Telephone No. 988 Holborn.

ALL Letters should be addressed to the Proprietors, H. Alabaster, Gatehouse & Co.

ADVERTISEMENT RATES ON APPLICATION.

The "Electrical Review" is the recognised medium of the Electrical Trades.

SUBSCRIPTION RATES.—In *Great Britain*, Post Free per Year, 19s. 6d. To *all other countries*, per Year, £1 4s.

BINDING.—Subscribers' numbers bound, including case, for 4s. each volume.

CASES.—Cloth Cases for Binding can be had, price 2s. 6d. each.

READING CASES, to hold from One to Twenty-six Numbers until the Volume is complete for Binding, can now be had from the Publishers, Price 6s. or Free by Post (in Great Britain), 6s. 6d.

FOREIGN AGENTS.—*New York:* D. VAN NOSTRAND, 23, Murray Street. *Paris:* VEUVE J. BOYVEAU, 22, Rue de la Banque. *Berlin:* ASHER & Co., 5, Unter den Linden.

Cheques and Postal Orders (on Chief Office, London) to be made payable to Mr. H. ALABASTER, 4 Ludgate Hill E.C.

LETTING OFF STEAM.

THERE was decided in Mr. Justice Bigham's Court last week a case of much interest to steam users, and as it is reported in another part of this issue we purpose devoting a little of our space to commenting upon this action in particular and to technical law cases in general. Naturally one would gladly welcome any new process which would reduce the coal bill, provided all other things are equal, and when an inventor comes forward claiming to evaporate some 75 per cent. more water per pound of coal than is effected in every day practice, and produce a horse-power-hour with less than half the coal we are at present compelled to consume, the prospect is an alluring one to company promoters.

The mysterious Guittari concoction which since 1896 has been threatening to revolutionise present steam practice is described in Specification No. 5,393 of the above-mentioned year, and briefly the process is as follows:—

"The invention has for its object to lessen the consumption of fuel in the generation of motive power by the employment in the boiler of water impregnated with a compound of carbonic acid gas, whereby the generation of pressure is rendered possible with an expenditure of heat energy very much below that by which it would be possible to generate steam in the ordinary way. The use of carbonic acid gas alone for this purpose would not, however, be practicable, as the gas would be quickly driven off from the water on the application of heat, with the result that the gas would become lost and the water be left in its natural condition. The invention consists essentially in the addition to the water of a compound resulting from the combination of carbonic acid gas and a re-agent, whereby the separate evolution of the carbonic acid gas is prevented, and the condensation of the combined gases and vapours after doing work is rendered possible without loss. This re-agent is ethene chloride, commonly known by the name of Dutch liquid." The impregnated water is then supplied to the boiler, the steam generated is used in an engine, passed through a surface condenser, and the ejected liquid used over and over again.

We regret that we are not at liberty to publish the plaintiffs' report *in extenso*, but we may state that the plant on which the tests, referred to in the lawsuit, were carried out consisted of a 10 H.P. nom. Colchester horizontal compound engine with surface condenser. High pressure cylinder 6 inches diameter, low pressure cylinder $10\frac{1}{2}$ inches diameter × 14 inches stroke; fly-wheel 5 feet diameter and 8 inches wide, with water space under rim; speed, 155 revolutions per minute.

Two locomotive multitubular boilers, each with 38 tubes 6 feet 4 inches long × $2\frac{1}{4}$ inches diameter; heating surface, 164 square feet, each boiler with grate area of $5\frac{1}{2}$ square feet.

The fire-boxes of both these boilers had, however, been bricked up so that the grate area was approximately 2 feet × 1 foot 6 inches = 3 square feet in each. One was charged with plain water, the other with Guittari's patent mixture.

During the progress of the trial before Mr. Justice Bigham, the report of the syndicate's consulting engineer was handed to one of the witnesses, the data of which contained two items of the utmost significance. One was that 16·3 lbs. of Guittari mixture had been evaporated per pound of coal; the other that 1·4 lbs. of coal produced a brake H.P.-hour. The tests of the plaintiffs, however, with Guittari stoking, gave 9·7 lbs. of water and 3 lbs. of coal! How are these descrepancies to be explained away; especially when we are assured that tests made by another well-known engineer, previous to those of the plaintiffs, and who was called on their behalf, gave substantially the same results as theirs! It is a well-known fact that if every heat unit in the coal could have been given to the water, 16·3 lbs. could not possibly have been turned into steam, and when we consider that not more than 70 per cent. of the heat was utilisable for that purpose, the figure obtained by the plaintiffs seems to be a reasonable one. Moreover, when questioned by his Lordship, this gentleman stated that he could not say whether the process was worth anything or not.

Guittari himself, a skilled stoker of the Italian Navy, it is said, could doubtless have thrown some light on the matter, but at the critical moment he was *non est*, and so the secret of the marvellous properties of his invention was left untold.

His Lordship, in his masterly summing-up, gave a brief extract from a report made by the plaintiffs in 1896 for a Mr. Belcher, but had he read a little further he would have noticed the plaintiffs concluded that although in the plant submitted to them at that time (a very small vertical boiler, which Guittari stoked, and an engine which developed between one and two H.P.) the patent liquid seemed superior to plain water, yet the results fell far below that of good steam practice with plant of moderate capacity. Still, the learned judge dismissed this point, and rightly so, as having no real bearing on the case at issue.

One factor which had a very important bearing on the result, was the correspondence between the parties previous to the experiments, the plaintiffs insisting on having a free hand and entirely repudiating the suggested methods of operation put forward by the defendants.

The tests were carried out with about equal brake loads upon the engine, and with equal grate surfaces for each experiment, but even without the plain water test the Guittari result of 3 lbs. of coal per H.P.-hour, with an evaporation of about 9¾ lbs. of water or mixture, was sufficient to prove the mixture to have no advantages, and on this the learned judge spoke very strongly and to the point. Even had an advantage been shown for the mixture, of what value can a process be which must be stoked by the inventor? There is but one Guittari, but there be many boilers.

One of the points in dispute was with reference to the use of an assisted draught, and in addressing the jury, the defendants' counsel laid very great stress upon this point.

Counsel did not apparently secure a full grasp of the purport of the assisted draught, which no doubt would be that it enabled a more rapid combustion to be secured. Instead, he grasped the idea that more air could thereby be put through the furnace, and went on to say that the more air that could be put through the furnace the better would be the results obtained; that air was equivalent to so much fuel, and saved the employ of so much coal, and therefore by multiplying the indraught of air the boiler power was so much multiplied. It was equivalent, said the learned gentleman, to a grate and half, but by what occult method of calculation he arrived at this result we know not. There was not the slightest allusion to the air giving power to burn so much more coal. The argument was perfectly clear and distinct that it was as a fuel the air or oxygen must be considered. We confess we were astonished. We had not thought it possible that so elementary a fact could have been so misunderstood, or that such an entire absence of technical knowledge existed anywhere among a body of men at the English Bar, including, as it does, so many men of really scientific attainments. Such an argument by a ready speaker put in a plausible manner before some juries composed of men of the same unfamilarity with the most elementary science of every-day life might work the gravest injustice if the case really turned on the point.

Fortunately in the case at issue the result did not depend on this, and the learned judge did not think it necessary to allude to it except in a very brief way, but evidently he was fully cognisant of the fallacy, and could have corrected the error had it been necessary so to do. It is often an extremely difficult matter to put facts in a manner that a jury will comprehend, and it becomes the more so when cross-examining counsel put questions that cannot be answered, which have not in them the scientific basis on which to build a reply.

Questions are sometimes quite irrelevant, and often absurd. We think non-technical counsel ought to avoid such cases as involve technical details, and we are a little doubtful as to whether jurymen ought not to be selected to some extent by their qualifications in technical cases.

An Interesting Experiment.—Mr Henry N. Warren, writing in the *Chemical News*, Vol. lxxvi., p. 200, claims "the production of electrical energy by the direct action of the atmosphere." The experiment by means of which he demonstrates this may be described as follows:—Plates are prepared of a special porous compressed graphite, and about one-quarter of each plate is rendered active by immersion in platinic oxalate, drying and igniting in an atmosphere of hydrogen. In contact with a solution of ferrous sulphate, the platinum surface induces oxidation of the iron by the oxygen of the atmosphere. Several of these plates are attached to a circular lead beam, which surrounds a porous diaphragm containing as negative element a rod of amalgamated zinc, the carbons being so arranged as to allow the platinised portion to project above the solution, which consists of strongly acidified ferric sulphate. On completion of the circuit, a powerful current is at once generated, and continues until the complete reduction of the ferric salt has taken place, which naturally terminates the action. On now withdrawing the zinc, the platinum surface condensing the atmospheric oxygen steadily re-oxidises the ferrous salt, and thus renews the action when required.

THE MUNICIPAL ELECTRICAL ASSOCIATION.

Probably the most important point raised by Mr. Gibbings in his Presidential Address was that relating to the standardising of plant, and the remarks made were singularly opportune, because they paved the way for Mr. Wordingham's paper on the "Uniformity of Plant." As the President pertinently remarked: "In the first place each manufacturer has his own particular type and sizes of plant and apparatus; each consulting engineer has his own ideas of speeds, periodicities, and systems of supply, and each borough electrical engineer has probably more 'fads' than all the rest put together." This is a frank avowal of the difficulties that have hitherto retarded the adoption of a system of standardisation, and certainly bespeaks a desire to remove some of the obstacles that have formerly stood in the way. No doubt much difference of opinion exists on many of the topics raised by Mr. Gibbings, and the following paragraph taken from the address sets forth one of the most debatable subjects in municipal supply:—

"My own opinion is, as regards the supply of electricity, that at present there is only one wise course for us to pursue. We are bound to act in the interests of our clients rather than to subserve the interest of the public generally. Only in that way shall we enlarge the constituency of our customers and thus be moving in the direction of a cheaper supply. In a certain city, which owns the gasworks, it has long been the practice to supply all the gas for the public lighting of the streets without making any charge whatever upon the rates. The whole cost has, in fact, been treated as if it were part and parcel of the costs of production for private consumption, thereby, of course, raising the price per 1,000 cubic feet charged to private consumers. Street lighting is undoubtedly a public necessity and a general boon, but the gas consumer alone in this instance is mulcted in the expense. I do not know that any great injustice arises, however, for the gas consumers are almost co-extensive with the ratepayers. But I should certainly deprecate any attempt at present to supply electricity for street lighting purposes on the same basis. It would practically mean burdening a comparatively few, that is, the consumers of electricity for the advantage of all. The entire cost of the public lighting, including the capital cost of erecting lamp pillars, represents no inconsiderable sum of money, and the burden would simply be intolerable. In addition to this it would not be, as I have already stated, a sound commercial policy."

The foregoing is by no means the only important point raised in the address, and, however opinions may be divided on Mr. Gibbings's method of dealing with the difficulties, there can be only one opinion as to the practical and able manner in which the whole field of municipal electric supply is surveyed.

Our record of last week's proceedings practically ended on Wednesday night, which were terminated by the annual dinner, held at the Holborn Restaurant. On Thursday morning the members assembled to discuss a paper on "Uniformity of Plant," by Mr. C. H. Wordingham; "Appropriation of Profits and Repayment of Loans," by Bailie Wm. Maclay, and "Single *v.* Multiple Generating Stations," by Mr. J. F. C. Snell. Following the admirable practice of former meetings, the papers were generally either taken as read or the principal features of the paper were referred to. The first paper of the day, Mr. Wordingham's, is referred to at some length in another part of this issue, but it may be interesting to record some of the principal points of the discussion. At the outset the President made an interesting announcement to the effect that a joint committee of the Municipal Electrical Association and the Institution of Electrical Engineers had been formed to consider the subject of standardising plant. Mr. Dawbarn, of the Brush Company, was first invited to contribute to the debate, and expressed his gratification as a manufacturer that the subject had been raised. They were prevented at the present time from making for stock, and they could not make provision for the future. It would have a great effect on cost if they could make a large number of machines at the same time. He thought it would be of immense service to manufacturers if they knew that in this matter they had the moral support of the Association. Passing on to another phase of the subject, Mr. Dawbarn said that many stations in this country had been started with small units, but the later practice of using large ones was sound, though at the start they suffered from the disadvantage of being run at an inefficient load. Mr. Chamen (Glasgow) thought that there was a general consensus of opinion as to standards, the question was, how to do it. With regard to the voltage of lamps, he was employing 250-volt lamps in Glasgow. Although this voltage might not be convenient for interior arc lamps, they had to remember that the inclosed arc lamp was rapidly coming in, and he thought it possible for three of these to work on 250-volt circuits. By working at 500 volts (across the outers) it meant practically 50 per cent. difference in what they could do with copper. Capt. Sankey agreed that the standardising of plant was of the greatest importance, and the suggestion proceeding from the Association was excellent. He spoke in favour of a standing committee of the Association to which questions of voltages could be referred. Mr. Robt. Hammond, as a consulting engineer, welcomed the movement most heartily. It was their duty to pay the least amount for good plant, and that can only be arrived at by standardisation. He had been much struck, when visiting the works of the Westinghouse Company in America, to see rows and rows of engines in stock. They had worked up their business by the facility with which they could supply engines from stock. He looked forward to the days when those concerns would be most successful who stocked. The question of pressure was the least part of the subject, but the size of plant ought to be capable of settlement. He expressed his dissent with the division of initial plant into sets; they had not in the past considered sufficiently the question of space. With regard to the periodicity question, what were they going to do with the works at present in existence. Mr. Snell (Sunderland) said, though engineers would like standard practice, they could not get it. Mr. Boot (Tunbridge Wells) referred to the financial difficulties of altering present plant to a standard. Mr. Cottam (Hampstead) raised the question whether they would not stifle progress by saying that they would make everything uniform; had they arrived at the stage when that could be done; local conditions very materially affected the question. Mr. Gibbings said there was a good deal of misconception as to the lines on which they proposed to go; it was impossible to standardise the whole system of plant; they could only attempt to standardise periodicities, horse-powers, and so on. Mr. Wordingham in replying on the whole discussion said he was prepared to admit that they were influenced by individual circumstances. He fully recognised that the question of lamps was a matter for argument, and could only be settled by a thorough discussion. That Association could not deal with the matter, for they constituted only a small section of engineers. Replying to Mr. Hammond's point as to size of plant, he thought that the best way of spending money was by subdividing plant; the periodicity question would be settled because most single-phase alternating current machines would be scrapped within the next 10 years. He did not suggest that they should alter everything, nor did he put forward any hard and fast rules; it was only standardisation in the way of sizes, and on general lines that they could proceed.

The "Appropriation of Profits" was the subject of the next paper, and Bailie Maclay dwelt upon the principal points, more, as he said, with the idea of drawing out discussion. It may be mentioned that the paper which is dealt with in another part of this issue does not agree with putting profits from electricity works to the relief of rates, but to be devoted to the lowering the price of electricity. Mr. Councillor G. Pearson (Bristol) was not slow in responding to the worthy Bailie's challenge, and said at the outset he did not agree with it. He held that those upon whose credit money was raised should have a share in the business. In Bristol they had 50,000 ratepayers, and 1,000 electricity consumers, and not more than 1 ratepayer in 50 had the advantage of electric lighting. If they used the credit of these 50,000 ratepayers for establishing electricity works, they might reasonably ask those who paid for the luxury to pay a little more, and so reduce the taxation. Before going in for public lighting, however, he considered that reductions ought to be made to the consumer. Mr. Higginbottom (Manchester) disagreed with the disposal of profits set forth in the paper. If ratepayers found money for an undertaking, and a profit was made, they were entitled to receive an amount of that profit; if there was a loss on the undertaking it did not fall upon the consumer but upon the ratepayer. The speaker alluded to the protection accorded to the consumer by the Board of Trade.

Mr. Robert Hammond said one of the most difficult things in accounts was the very great difference that existed between the ultimate disposal of what some called profits and others gross profits. If every chairman of committee had the Act of Parliament in his head they would have accurate account keeping. He did not know till then that it was possible to evade the Act by supplying public lighting for ½d. per unit. He found in the case of Glasgow that they were only contributing 1 per cent. to the sinking fund, whereas in Manchester and Sunderland they had to contribute sufficient to repay the loan in 25 years. Leeds, however, which had applied for a provisional order to acquire the Leeds Electric Lighting Company's works had obtained permission to retain the loan for 40 years. They ought to consider that it was the general ratepayer who had to sanction the loan, and nothing pleased him more than to think that a small profit was going into his pocket. Mr. Barnard (Hull) pointed out that if they applied for a loan for machines they were given 15 years to repay, for mains 20 years, and if together 25 years. Mr. Arthur Wright said he once had the opinion that when they started the supply of electricity they were going to supply electricity to ratepayers. Some corporations got only 25 years to repay the loan, and he thought that ought to be the limit, because if they got 42 years they wanted a bigger depreciation fund. Returns to the ratepayers could be made in two ways, by handing over large sums, or building up a sound business, by lighting streets at cost, laying services and mains all over the town. That was a far sounder way of repaying the general body of ratepayers, than handing over sums of money year by year. Lowering the price did not necessarily increase the deficits, and might, in fact, increase the profits. The chief points of Bailie Maclay's reply were, that he was not there to show a bright and shining example. Things appeared to be different in Glasgow, for there was not a single occasion when they had a deficit; they gave something to the ratepayers, in fact, all they had to spare. They raised their money by issuing stock, and when their term expired they borrowed a fresh loan. He agreed with Mr. Wright on the subject of street lighting, they never thought of giving current for street lighting at less than cost.

The next paper was that of Mr. Snell's on "Single *v.* Multiple Generating Stations," but on account of the lateness of the hour, it was not possible to do more than hear a few opening remarks from Mr. Chamen.

The arrangements for the afternoon included a visit to the new works of Messrs. Willans & Robinson at Rugby, and it may be said without exaggeration that it constituted the most valuable object lesson in standardising that was provided during the Convention. Two special saloon trains were provided for the visitors who travelled to Rugby in almost Royal style. Messrs. Willans & Robinson's works are no doubt among the finest workshops in the country, and the excellence of the methods carried out here merit more attention than we are able to give at the moment.

The last day of the Convention was devoted to discussing Mr. Snell's paper, to which we have already referred, and a series of papers on electric traction. Those of Mr. R. C. Quin (Blackpool) and Mr. J. E. Stewart were taken first, and evoked a fairly long discussion. Mr. Rider brought out one or two good points; he objected to depending upon the tramcars for fly-wheel effect, on the ground that it was impossible to find a town where uniform motion of tramcars could be obtained, the speed and the power of the car were constantly varying. He did not approve of car mile, and he considered ton mile as bad; what they had to compare was the passenger mile. He was in favour of an entirely separate committee for a tramway, and the electricity committee should supply electricity to a tramway committee as to a separate consumer. Alderman Higginbottom, Bailie Maclay, and other speakers, followed, but perhaps their remarks will be more appropriate when we publish the papers.

APPROPRIATION OF PROFITS AND REPAYMENTS OF LOANS.

The paper contributed by Mr. Bailie Wm. Maclay, the Convener of the Electricity Committee of the Glasgow Corporation, deals with two subjects, viz., "The Appropriation of Profits and Repayments of Loans."

With regard to the first, Mr. Maclay points out that the policy of the Glasgow Corporation is not to make profits; and here he raises an issue which forces itself upon the serious consideration of all who are responsible for the conduct of municipal trading undertakings. Without doubt the success of those undertakings is generally judged by the amount that is annually handed over to the General Rate Fund.

With this view the policy of the Glasgow Corporation is in direct conflict. "We recognise," says Bailie Maclay, "the fact that not one of these departments exists to make profits as is the case with a private commercial concern—but that rather it has been called into existence for the benefit of the community as a whole," and in opposition to the principle adopted in Manchester, the Bailie further contends:

"That what has been taken from a . . . . consumer in excess of the cost of production and distribution, should be given back to him at once and directly through the department, in the form of a reduced charge in the immediate future. This meets all the wants of the case, and inflicts a hardship on no one. . . . . We hold," he continues, "that it is a sound policy to place as few restrictions on business as possible, especially in these days of keen competition. We maintain that if any of our commercial departments, originated solely for the good of the people as a whole, is compelled to keep the price of anything above the cost of production and distribution; then . . . . an artificial and arbitrary restriction is placed on the business of that committee."

Those who oppose this principle urge that as no municipal commercial undertaking can be conducted without some risk to the ratepayers, it is only fair that the consumers should, in addition to the actual cost of generation and distribution, provide, as a form of insurance, a margin of profit for the benefit of the general ratepayer. It is he whose credit enables the municipality first to borrow at a low rate of interest, and secondly, to arrange for repayment of the capital account over an extended period. It is he whose veto may operate in restricting extensions, and who must be conciliated as the sleeping partner in the concern by the enjoyment of profits, however moderate.

While fully recognising this principle, the Board of Trade, in framing the provisional orders issued under the Electric Lighting Acts, takes care that the consumer shall not be mulcted in an unreasonable sum.

Section 52 of the model order provides for the payment out of revenue of :—

1. Working expenses, *i.e.*, costs of generation and distribution.
2. Interest on borrowed monies.
3. Instalment of sinking fund.
4. All other expenses not properly chargeable to capital.
5. Reserve fund (which duly invested in Government securities shall at no time exceed 10 per cent. of the aggregate capital expenditure).

The net surplus then remaining must be carried to the credit of the local rate.

Here again, however, the consumer is protected, for it is enacted that if the surplus in any year exceeds 5 per cent. upon the capital expenditure, a reduction must be made in the charge to consumers. On the other hand any deficiency must be payable out of the rates.

So much for the provisions enacted by the Board of Trade. It will be seen that it is taken for granted that the price paid by the consumers should certainly be sufficient to do much more than Bailie Maclay, speaking on behalf of his Glasgow colleagues, suggests. Carried to its logical conclusion, his contention would only call upon the consumer to pay the "sheer" cost of production and distribution, which amounted in Glasgow last year to a trifle under 2d. per unit. An examination of the accounts, however, shows that though the principle enunciated by Glasgow may appear revolutionary, its method of application by the "cannie Scot" leaves the consumer worse off than he is, say, in Manchester, whose ways the Bailie holds up to reprobation.

To make this clear we set out in the case of Glasgow the sum received from the consumers in the year under review, and we add the figures supplied by Bailie Maclay showing how this sum was disposed of. In doing so we work out the ratios which the sums disposed of bear to the gross sum received.

GLASGOW.

Revenue	£30,000	100 00%
Costs of production and distribution ...	£12,000	40 00%
Depreciation	10,705	35 68%
Interest on capital	4,300	14 33%
Sinking fund	1,466	4 89%
Carried forward	1,527	5 09%
	£29,998	99 99%

Average price charged to consumers, 5·08d. per unit.

It will be seen that while only 4 89 per cent. of the sum contributed by the consumer is set aside for sinking fund, a ridiculously inadequate figure, at any rate as far as the generating plant and mains is concerned, more than one-third of the revenue drawn from him is put aside for depreciation, and finally, in flagrant defiance of the law, £1,527 is carried forward instead of being handed over to the General Rate Fund. Those who differ from the Bailie in his proposition that the profits belong to the consumer will smile at the summary way in which he has excluded him from all participation therein. Bailie Maclay points to Manchester as a typical example of how not to do it. Let us see how the Manchester figures compare with those of Glasgow.

MANCHESTER.

Revenue	£49,744	100·00%
Costs of production and distribution ...	£15 284	30 73%
Depreciation	3,344	6 72%
Interest on capital	7,171	14·42%
Sinking fund	7,133	14 34%
Reserve fund	6,812	13 69%
Handed to City Fund in aid of rates ...	10,000	20 10%
	£49,744	100 00%

Average price charged to consumers, 4·63d. per unit.

If the ratepayer-consumer compares the method adopted by Manchester with that adopted by Glasgow, of disposing of the revenue contributed by him, he will, we think, be disposed to pray for deliverance from his friends.

Possibly, however, it may be urged that Bailie Maclay, in referring to Manchester, used an unhappy illustration, and, apart from it, his main contention has still to be considered, *i.e.*, whether municipal works should exist primarily for the benefit of the consumers or the ratepayers.

Our own view is that the general ratepayer has a right to demand from the consumer some *quid pro quo* for the pledging of his credit. In ordinary commercial transactions a banker, for instance, would not hesitate to demand a substantial commission for guaranteeing a credit, and the general ratepayer whose pledge of the communal property enables the community to borrow at, say, 3 per cent., is surely justified in demanding that those who are thereby benefited shall contribute the same percentage on the investment as if it were made by a company.

If such a principle were not acknowledged, there would surely be a speedy end to municipal trading in this country.

Returning to Bailie Maclay, the Glasgow ratepayer has certainly no cause to complain that the burden put upon the electric light consumer is too light a one; indeed, some Glasgow consumers are puzzled to know why, on an almost identical output, his compeer at Edinburgh gets his electricity fully ½d. per unit cheaper, and why he is not supplied at a cheaper rate than that which Aberdeen can afford on a comparatively insignificant output.

Turning to the second part of Bailie Maclay's paper on "The Repayment of Loans," we find much interesting matter with regard to the rates fixed for the liquidation of the loans in connection with the police, sewer construction, street improvement, water supply and markets; but as similar information is not afforded in the case of the gas and electricity department, we are not able to say whether the rate proposed for future years for the electricity undertaking is an equitable one, though we must repeat our surprise at the lowness of the charge of £1,466 for redemption of a capital of over £140,000.

We venture to suggest that local authorities operating under the Electric Lighting Acts should adopt a uniform rate in respect of the sums set aside annually for the sinking and reserve funds, and as those who are compelled by the Local Government Board to repay their loans in 25 years have to provide annual instalments of about 3 per cent. sinking fund, we suggest this minimum figure as the basis for general adoption.

UNIFORMITY IN PLANT.

Of all the papers set down for reading and discussion at the meetings of the Municipal Electrical Association, the one which is, perhaps, of most general interest is Mr. Wordingham's paper on "The Necessity for Uniformity in Plant and Apparatus" (see page 854), as it deals with a subject which is of considerable importance to the advising engineer and his client, to the engineer who is responsible for the working of the plant, and to the manufacturing engineer who supplies it. We have quite recently, in the editorial columns of our issue of May 27th, dealt with some of the points brought forward by Mr. Wordingham, and after a perusal of the statistics given in his paper, we find that in such matters as frequency of alternating currents and voltage of lamps there is even a greater want of uniformity than we were aware of at the time of writing the article referred to. For instance, in Table A, giving the various pressures declared by 109 central stations, no less than 20 different pressures are found, of which eight are between 100 and 115 volts, and six between 200 and 230 volts; whilst from Table B we learn that 19 different periodicities have apparently been found necessary to satisfy the requirements of 58 alternating current stations. Again, from Table D we learn that in the 51 stations using continuous current there are 38 different sizes of unit, ranging from 10 to 1,500 kilowatts, and that 30 of these are for 200 kilowatts or less; and in the 58 stations using alternating currents there are 56 different sizes, ranging from 20 to 390 kilowatts. When one considers that machines of the same output in kilowatts may be required at different pressures, speeds, and frequencies, there is good reason to agree with the author of the paper when he speaks of the chaotic state of central station practice as regards standardisation.

Having quoted statistics to show the necessity of reform, the author proceeds to make various suggestions as to the standardising of apparatus. Commencing with the declared pressure, which is the most important point, since it affects both generating and receiving apparatus, the author suggests that 100 volts and multiples thereof should be adopted as a standard, as more stations are using these pressures than any other, and as they lend themselves very well to the various uses to which central station supply is applied. There is no doubt that for many reasons this would be a convenient standard, but the tendency of later practice has been rather towards 110 volts and its multiples, and we fancy that many advocates of this latter pressure will be found who will advance the arguments that it is as easy to get incandescent lamps of 110 and 220 volts as those of 100 and 200 volts, that two arc lamps will burn better on a 110-volt circuit, and that it would be a mistake to sacrifice the 10 per cent. higher pressure and 10 per cent. lower current, with the consequent saving in mains for equally good regulation of pressure at the consumers' terminals. With regard to consuming devices, we fully agree with the author of the paper as to the advantages that would be gained by adopting a limited number of standard candle-powers for incandescent and arc lamps, and of standard sizes of motors. The greatest difficulty would be experienced with the motors, as in this case the various requirements as to speed enter into the question, and the manufacturer would derive but little benefit from the fixing of standard outputs in brake horse-power, if these outputs are required at varying speeds. The point which is of most interest to the manufacturer of dynamos and motors is, we should imagine, that the output per revolution should be taken as the basis of any standardising of sizes, as this would enable him to keep to a small number of sizes of machine frame, and it is in this part of the manufacture that the multiplicity of sizes leads to the greatest increase in the cost of production.

The same difficulty occurs in the fixing of a series of sizes of generating plant, since the question of speed comes in in all cases where the engine and dynamo are direct coupled. At the present time there are already signs of a tendency to standardise so far as the output in kilowatts is concerned; but there are two distinct interests that have to be considered in this matter, viz., those of the engine maker and those of the dynamo maker. Now it is well known that the speeds at which engines of equal horse-power will be run by different makers vary very appreciably, and the question, therefore, arises whether the engine makers are to be persuaded to adopt a standard speed for a given horse-power, so that the dynamo makers can standardise the sizes of their machines; or whether, as is the case at present, the dynamo maker is to adapt his dynamo to the speed of the engine to which it is to be coupled, in which case he must be prepared to supply a different machine to go with each type of engine although they all give the same output in kilowatts.

With regard to the sizes of unit to be adopted, we think that in very many stations the mistake has been made of commencing with units of insufficient size; the reason being that more attention has been paid to obtaining such a subdivision of the plant as would give the most economical working during the initial stages of the undertaking than to fixing a size of unit which would suit the probable requirements after a few years' working. Mr. Wordingham seems to suggest six as the minimum number of sets which should be installed for a beginning, but we should prefer to start with a smaller number in any station where the probable ultimate capacity was much greater than the initial capacity; as otherwise the first sets would in a few years' time be found to be too small, and very probably would have to be taken out altogether and replaced by larger units. The statement in the paper that it is preferable to have reserve plant in the shape of machines which can be safely worked at 25 or 33 per cent. beyond their most economical load is one that we quite agree with, and is really only another way of saying that machinery should be employed which gives its most economical results at three-quarter load or thereabouts, a procedure we have advocated in these columns before now.

The question of standardising distributing plant is next dealt with in the paper, and the suggestion made therein, that a certain limited number of standard sizes of cables should be agreed on, is one which should meet with the approval of cable manufacturers; as, notwithstanding the large number of different types and sizes of cable described in their published lists, it is necessary, we understand, in very many cases to make special cables to meet the specifications issued for supply mains.

The whole question of standardising plant is, owing to the many interests involved, a complicated one, and will require a good deal of thrashing out; but we believe that much good would result from a thorough examination of it by a representative committee composed of those who have to use the plant and those who have to make it. We did not know, when we published the article already referred to and invited the attention of our readers to the question of standardisation, that we were so soon to learn that the matter was already under consideration; and we hope that the preliminary steps which have already been taken will lead to the appointment of a thoroughly representative committee, and that their deliberations will result in the adoption of more uniform requirements on the part of the users of electrical plant, as we consider that benefit will result therefrom to all parties, as the cheaper production and quicker delivery which should follow such a movement should still further develop the use of electrical apparatus.

WIRELESS TELEGRAPHY.

It is not surprising to find that the public interest in the Marconi system of wireless telegraphy is rapidly increasing, and demonstrations of a more or less public character are being constantly carried out. Some allusion has been already made to some interesting experiments on this system which were conducted some days ago between the House of Commons and St. Thomas's Hospital. One station was in the small smoking room just off the Terrace at the House of Commons, and the other was fixed in the treasurer's house at St. Thomas's Hospital, at the opposite side of the river Thames.

At the House of Commons end the instruments were placed in the small smoking room alluded to, and a wire was led through the window and attached to a short pole, which was tied to one of the lamp-posts on the Terrace a few feet from the window. At the hospital end the instruments were also under cover in an upper room, and the wire in that case was led from the window down to the top of a lamp-post about 6 feet from the wall of the hospital. We need hardly repeat here the method of sending signals, but we may mention that the time occupied in fixing both installations was under an hour, and immediately after, the Speaker, Sergeant-at-Arms, and other Right Hon. and Hon. gentlemen came into the smoking-room to see the first experiment.

Many messages were sent between the two institutions, and it is necessary to record that the first news of the resolution passed by the House of Commons in connection with the public funeral of the Right Hon. W. E. Gladstone was conveyed wirelessly to St. Thomas's Hospital in the terms of the following message sent by Mr. O'Malley:—"The House of Commons to-day solemnly and unanimously resolved that a public funeral be accorded the late William Ewart Gladstone, and a monument be raised to his memory in Westminster Abbey," which was suitably acknowledged from the hospital end of the wireless system. The various messages sent and received were all printed on tape, and afforded every satisfaction to those who witnessed the experiments at either end. Of a more practical nature, however, was a series of experiments which were carried out by the Wireless Telegraph Company on the 3rd inst. before Lord and Lady Kelvin and Lord Tennyson at their Alum Bay station, Isle of Wight. After inspecting the outside of the station, the visitors went into the operating room, where they carefully examined the instruments and witnessed the sending and receiving of several messages. Lord Kelvin sent messages wirelessly to Dr. MacLean, his chief assistant in the physical laboratory of the University of Glasgow, to Sir George Stokes at Cambridge, and to Lord Rayleigh and Mr. W. H. Preece in London.

The message to Sir George Stokes was as follows:—"Stokes, Lensfield Cottage, Cambridge. This is sent commercially paid at Alum Bay for transmission through ether, 1s. to Bournemouth, and thence by postal telegraph, 15d. to Cambridge.—Kelvin."

Lord Tennyson's message was to his nephew at Eton, and was as follows:—"Sending you message by Marconi's ether telegraph, Alum Bay to Bournemouth, paid commercially thence by wire; very sorry not to hear you speak your Thackeray to-morrow.—Tennyson." Lord Kelvin insisted on paying 1s. per message royalty for the use of the Marconi system on all the messages he sent, in this way wishing to show his appreciation of the system, and to illustrate its availability already for commercial use.

With the achievement of these striking results one ought not to wait long before a practical application is made of the wireless telegraph.

CONSULTING ENGINEERS AND PUBLIC COMPANIES.

Writing to the *Engineer*, a correspondent finds fault with our contemporary's commendation of Sir F. Bramwell's action in the case of the Hydraulic Joint Company. He thinks that an engineer ought not to step on one side to tell anything beyond the narrow rut in which promoters wish him to carry out his tests. As we have already said, we do not know that an engineer need particularly concern himself with patent rights of a matter upon whose mechanical merits he may be reporting. We do not like the tone of the letter; nor do we think the writer has picked his illustrations at all well. He cites a case of an engineer testing an American machine, and reporting favourably upon it in ignorance that there was already a better English machine in the market, and he asks us to judge if the engineer was to blame. This is not a case in point. The man reported favourably on a good American machine. It was used in some special trade apparently, and the engineer could not necessarily be expected to know there were better English machines. But if he had known and was honest he would have informed his employers of the fact. Possibly they knew, but it is equally possible they did not know.

Let us quote a case ourselves. The owners of a patent wanted certain comparative tests. Having got them they objected to pay the fees on the ground that the tests were not conducted on the lines they desired. The particular point of dispute was the employment of the patentee to perform one particular and essential function, both on the new process and on the old. It had already been declared that the new process effected a saving of so much per cent. as compared with the old process.

The testing engineers refused to lend themselves to this, as the results obtained would have been simply equivalent to a record of two performances of one man, conducted in one case to the best of his ability, in the other as he deemed fit. The case went to the Courts, and the verdict was for the engineers, who were practically commended for not allowing themselves to be tied by a promoter's chain.

Most engineers will be familiar with the facilities afforded by promoters' plant for misleading mechanical tests. It is to be regretted that too many engineers satisfy any qualms they may feel by adding some remark inconspicuously in their report which will not appeal to the lay public.

The *Engineer's* correspondent thinks an engineer is an over-scrupulous fool who does not allow himself to be a medium for gulling the public. Why should he care for the public, who will certainly not care for him when he comes to beggary through his honesty? This is all very well. Because the public is a "hass," the engineer is to be free to be a rogue. This is not satisfactory. But out of the 20 millions of the public, there are peradventure 10 righteous men. Is the engineer to assist to defraud the 10 righteous, simply because he has a poor opinion of the 19 and odd millions?

The letter we criticise simply begs the whole question. We have already stated that an engineer must be allowed to judge each case by itself. We would add a further suggestion that, for the guidance of all testing engineers, the various engineering societies should combine to retain the services of some independent man or men to whom, in a difficulty an engineer could go for advice if he has doubts as to the propriety of the course he should take, in any case where he feels a temptation to be, in the words of the *Engineer's* correspondent, "too honest."

A POWERFUL ELECTRO-MAGNET.*

M. SAGNAC exhibited to the Society a new electro-magnet for the production of very intense magnetic fields, constructed from the designs of M. Pierre Weiss. Most electro-magnets now in use are of an old type which has not changed since the time of Ruhmkorff, and notwithstanding their admitted excellence, are inferior to those designed from the now recognised properties of the magnetic circuit.

M. du Bois showed this from theoretical considerations, and verified his conclusions with a powerful annular electro-magnet weighing 270 kg., and absorbing 6·5 horse-power. With this he obtained the most intense field yet reached, a field of 38,000 units. The new instrument shown to the Society gives comparable results, though it is much less cumbrous and costly, weighing only 100 kg. and absorbing 2 horse-power.

The rectangular magnetic circuit is arranged to saturate the poles only. The use of but a small excess of section in the part of the circuit which is distant from the poles effects a notable economy in the ampere turns, because the permeability increases very rapidly below the saturation point.

Ease in adjustment of the pole-pieces is of some importance. The adjustment is made by an arrangement like the back centre of a lathe, so that either pole can be advanced or withdrawn with precision, while the construction is sufficiently strong to prevent any flexure. The rectangle forming the magnetic circuit is suspended horizontally by two strong bolts to an oak frame, leaving the space below the poles available for the other apparatus. The field obtained varies with the form of the pole-pieces. At the common apex of two conical armatures it is infinite, but decreases as the cones are more truncated. With cones truncated so that the small base is 1 cm. in diameter, $\mathfrak{H}$ = 30,000 units.† But the true measure of the quality of the instrument is the intensity of the magnetisation of the pole-pieces necessary to produce a given field.

$\mathfrak{I}$ = 1,630 is the figure deduced from M. du Bois measurements on his more powerful apparatus. Knowing this, one can calculate the field to be obtained with any cones; for instance, with a space 1 mm. × 2 mm., the apparatus would give 44,000 units. With the aid of M. Weiss's electro-magnet, M. G. Sagnac performed before the Society the experiment by which M. A. Cotton showed the change produced in the wave length of sodium light by a magnetic field. The edge of a yellow sodium flame A, observed against the back-ground of a similar flame B, is seen to be black if the flames are suitably arranged. This is due to the fact that the sodium flame is surrounded by a zone some millimetres thick of non-luminous or slightly luminous gas containing sodium vapour, which absorbs the light of the lines, D_1 D_2. M. Cotton has remarked that this black border, first noticed by Crookes, only appears if the lines, D_1 D_2, in the flame B are very narrow. The border disappears completely if B is a brilliant flame containing much sodium, and giving broad D lines. It can be shown in other ways, that the edge of the flame gives two very narrow absorption lines, D_1 D_2. They are so narrow that the change of period produced in the flame, B, by a magnetic field, destroys the absorption, and causes the black border round the flame, A, to disappear, and to re-appear sharply when the magnetic field is suppressed.

This experiment was described in the *Comptes Rendus* of November 29th, 1897; and with more detail in an article in *Eclairage Electrique* (March 5th, 26th, 1898), where are also given experiments on the reversal of the sodium lines, and on the application of reversed lines to the study of the Zeeman effect.

In the experiment performed before the Society, the observation was made parallel to the field. The very intense field employed makes the experiment easy, but is not really necessary. A field of 1,000 units is sufficient if the flames are suitable. The observation can be made at right angles to the field, and the different behaviour of the vibrations when parallel and perpendicular to the field can be observed with the aid of a nicol. Or the arrangement proposed by M. Kœnig (*Weidemann's Annalen*, December, 1897, suppl.) may be employed for observations normal to the lines of force.

* Translation of a paper read before the Société Française de Physique, May 20th, 1898.

ROYAL SOCIETY CONVERSAZIONE.

THE second conversazione of the Royal Society held on June 8th was not distinguished by anything very remarkable in the number or originality of the electrical exhibits. The new gas Krypton—the latest find of Prof. Ramsay in the residues of the atmosphere—was the great scientific sensation of the evening. Only one part of this gas occurs in 10,000 parts of air, and it was necessary to evaporate about one litre of liquid air in order to find it. The spectrum shows two brilliant lines, one of which is almost coincident with a line in the helium spectrum. The finding of so many new elements recently, in a field so well explored as the atmosphere, is calculated to shake the foundations of our chemical faith.

† Ewing gives $\mathfrak{H}$ = 24,500, $\mathfrak{B}$ = 43,350 as the highest induction he has obtained, the dimensions of his "isthmus" being 2·66 mm. diameter, 3·5 mm. long.

The Steljes Printing Telegraph Recorder was exhibited by Louis P. Casella. This instrument is operated by the Wheatstone A B C magneto-transmitter, and does not require batteries. The printing lever is raised and held up by the alternating current from the transmitter energising an electro-magnet, and when the circuit is broken it is released and allows the weights to do the printing. About 12 milliamperes are required for the instruments, several of which can be worked from one transmitter over a distance of at least 40 miles. The messages sent are printed simultaneously at the sending and receiving stations, and require no skilled operators. The device for placing all the instruments in circuit, in unison, is an interesting one. It prints with rubber type on a tape.

The automatic telephone switch exhibited by the Direct Telephone Exchange Syndicate appeared to be a remarkably efficient instrument for doing the work of the telephone girl. Exchanges for 1,000 or more subscribers have been worked successfully on this system. Secrecy of conversation and continuous service day and night are some of the obvious advantages of such systems, if they can be successfully carried out.

Mr. Roxby exhibited some remarkably good specimens of photographs in natural colours obtained by a process invented and patented by Dr. Selle. As in Ives's, Vogel's, and similar processes, three negatives, representing the three primary colours, are first obtained. From these negatives (in Selle's process), positives are printed on coloured collodion films and superposed. Collotype printing surfaces, with suitably coloured inks, may also be used when larger quantities are required. These three colour processes are likely, in the future, to play a very important part in the reproduction of works of art.

Mr. Campbell Swinton has considerably improved his cathode lamp since the last conversazione. He has now been able to get a light of an intensity of 100 C.P., 1 watt giving about 1 C.P. Mr. Swinton uses alternating currents of about 10,000 volts to excite a tube with two cathode discs which focus the cathode rays on a refractory material. The refractory material becomes brilliantly luminescent. This is a considerable advance upon Ebert's lamp, which never gave much more than 1 C.P., though it was asserted to be enormously more efficient than anything claimed by Mr. Swinton.

Messrs. Watson & Sons exhibited the new induction coil, designed by MM. Wydts and Rochefort, described in the ELECTRICAL REVIEW, 42, p. 165, and criticised recently by Mr. Apps in a paper read before the Röntgen Society (ELEC. REV., Vol. 42, p. 782). The instrument exhibited was said to yield an 8-inch spark. The secondary wire weighed less than 2 lbs., and occupied a narrow central position round the primary wire. The insulation was effected by means of a thickened oil of secret composition.

Lord Blythswood and Mr. E. W. Marchant showed some interesting experiments bearing on electrostatic phenomena in vacuum tubes. In a specially shaped tube the flow and return of the electrified particles of the residual gas was shown to be affected by external bodies suitably placed outside the tube. The diagrams illustrating the variation of potential difference at different distances in tubes with movable electrodes were especially interesting. A peak of maximum E.M.F. has been found to exist at a moderate distance between the electrodes, a rapid falling off taking place, both when the distance is diminished, and when it is increased.

Prof. Callendar's apparatus for electrically recording temperature at a distance was shown at work. Diagrams were shown of temperature curves which had been produced at a distance of a mile from the place of observation.

THE REPORT OF THE PARLIAMENTARY ELECTRICAL ENERGY COMMITTEE.

THE report from the Joint Select Committee of the House of Lords and the House of Commons on Electrical Energy (Generating Stations and Supply) has now been published.

The Committee was appointed in March to consider and report—

1. Whether, notwithstanding the provisions of Section 12 (1) of the Electric Lighting Act, 1882, powers should be given in any cases for acquiring land compulsorily for generating stations; and, if so, under what conditions as respects liability for nuisance, notices to surrounding owners, and otherwise.

2. Whether compulsory powers of acquiring land for generating stations, if proper to be given in any case, should be given where the proposed site is not within the area of supply.

3. Whether, in case of a generating station, however acquired, not being situate within the area of supply, power should be given for the breaking up of streets between the generating station and the boundary of the area of supply.

4. Whether powers should be given in any case for the supply of electrical energy over an area including districts of numerous local authorities, involving plant of exceptional dimensions and high voltage; and, if such powers may properly be given, whether any and what conditions should be imposed—

(a) With respect to system and plant, and to the construction and location of generating stations, in view of the powers of purchase conferred upon local authorities by Sections 2 and 3 of the Electric Lighting Act, 1888.

(b) With respect to the relations of the promoters to other undertakers and to local authorities within parts of the area.

5. Under what conditions (if any) ought powers to be conferred upon promoters seeking to supply electrical energy to other undertakers and not directly to consumers.

The House of Commons appointed Mr. Ashton, Lord Balcarres, Mr. Kimber, Sir Leonard Lyell, and the House of Lords appointed the Lord Privy Seal (Viscount Cross), Earl Spencer, Viscount Knutsford, Lord Monkswell.

The Committee reported:—That the Committee have met and considered the subjects referred to them, and beg leave to make the following report:—

The Committee have taken evidence from Sir Courtenay Boyle, K.C.B., the Right Honourable the Earl of Morley, the Honourable Chandos Leigh, Q.C., Mr. Preece, C.B., engineer-in-chief and electrician to the Post Office, and from Major Cardew, electrical adviser to the Board of Trade.

Counsel appeared before the Committee on behalf of the following:—

1. Central Electric Supply Company, Limited.
2. Chelsea Electricity Supply Company, Limited.
3. General Power Distributing Company.
4. Midland Electric Corporation for Power Distribution, Limited.
5. House-to-House Electric Light Supply Company, Limited.
6. Kensington and Knightsbridge Electric Lighting Company, Limited.
7. London Electric Supply Corporation, Limited.
8. County of London and Brush Provincial Electric Lighting Company, Limited.
9. Westminster Electric Supply Company, Limited.
10. Corporation of Doncaster.
11. Corporation of Glasgow.
12. Corporation of Huddersfield.
13. Corporation of Ilkeston.
14. Corporation of Lincoln.
15. Corporation of Manchester.
16. Corporation of Nottingham.
17. Corporation of Retford.
18. Corporation of Rotherham.
19. Corporation of Salford.
20. Corporation of Sheffield.
21. Corporation of Wolverhampton.
22. London County Council.

The Corporation of Edinburgh and the Metropolitan Electric Supply Company were represented before the Committee by their Parliamentary agents.

The several Bills now pending in Parliament in which effect is proposed to be given to new developments of the electrical industry, have been brought to the notice of the Committee, but they have not considered them in detail, nor taken any evidence upon them. They have treated them only incidentally, as showing the lines upon which the industry is likely to expand. They have laid down the general principles which they suggest should guide Parliament and the Board of Trade, but whether those principles should in whole or in part be applied, and whether any and what special conditions should be imposed, must, of course, be decided in each individual case, according to its merits.

The Committee have heard all the witnesses tendered by the several parties, and have agreed upon the following answers to the several questions referred to them:—

Question 1.—(a) The proved public advantages of electrical energy in the generation of light and power warrant, in their opinion, the granting to undertakers of compulsory powers for acquiring sites for generating stations and lands or easements for pipes and mains therefrom, and other works.

(b) Provision should be made for the granting of these powers in the provisional orders of the Board of Trade, subject to confirmation by Parliament. Such provision would facilitate a continuance of the existing practice, according to which more or less uniform conditions under which undertakers are to work are provisionally settled by the Board of Trade. Procedure by private bill should be reserved, as at present, for exceptional cases.

(c) Such powers may be given either to local authorities or to incorporated companies, whether the incorporation be by special Act or provisional order or under the Companies' Acts.

(d) With respect to liability for nuisance, they are of opinion that where the site for a generating station is acquired under compulsory powers, and is specified in the provisional order or special Act, the undertakers should not be subjected to any further liability than that which, according to Lord Blackburn (*Geddis* v. *Bann Reservoir*, 3

App. Cas. 455),* is imposed by the common law in the case of persons exercising statutory powers and duties. On the other hand, where the site for a generating station is acquired by agreement, they think the undertakers ought to be subject to the liability imposed by the common law.

(c) With respect to notices, they think that the existing practice as to notices to the local authorities and also to owners, lessees, and occupiers of lands proposed to be taken should be followed.

With respect to notices in gazettes and newspapers, they do not suggest any amendment of the existing procedure.

The amendment of the Electric Lighting Acts, necessary to empower the Board of Trade to grant compulsory powers, will, they assume, comprise provisions for notices and other matters of procedure, for which precedents are found in the Housing of the Working Classes Act, 1890, and in the Light Railways Act, 1896.

Question 2.—Subject to the above observations, the Committee are of opinion that compulsory powers for the acquisition of land for a generating station, and lands or easements for pipes and mains and other works to the area of supply, may also properly be given where the proposed site is not within the area of supply. The local authorities for the district or districts in which the site is, and the owners, lessees and occupiers, should have the same notices and the same *locus standi* as if that district were the area of supply. Provision also should be made for serving notices to local authorities and owners, &c., of districts or land through whose districts or land mains are to be run from the generating station to the area or areas of supply.

Question 3.—In the case of powers being given for the erection of a generating station outside the area of supply, they think that powers may properly be given for laying the mains in streets leading from the generating station to the boundaries of the area of supply. In such case the local authority liable to maintain these streets should have the same option of themselves breaking up and reinstating the streets at the undertakers' expense as is now given in the provisional orders to local authorities within the area of supply, and should be empowered accordingly.

The Committee are of opinion that while it may be advisable to maintain the veto of local authorities as to the erection of overhead wires, given by Section 14 of the Act of 1882, in respect of other electric wires, it is not advisable that in the case of overhead wires for traction purposes the local authority, other than the London County Council and County Boroughs, should have an absolute veto. While due weight should be given by the Board of Trade to the representations of local authorities, the Committee think that in the case of wires for purposes of traction it would be sufficient to give a *locus standi* to such local authorities.

Questions 4—5.—Where sufficient public advantage is shown, powers may be given for the supply of electrical energy over an area including districts of numerous local authorities, and involving plant of exceptional dimensions and high voltage. The Committee further think that undertakings of this character may properly be authorised on conditions differing in some respects from those imposed by and under the existing Acts.

Among the undertakers referred to in the preceding paragraph will be found undertakers supplying energy chiefly in bulk or wholesale to other undertakers, whether local authorities or companies, whose areas of supply are wholly or partly within the area of such bulk or wholesale supplying company, and who distribute the energy so obtained to consumers.

As to giving compulsory powers of purchase of undertakings to local authorities, the Committee, without questioning the policy of Parliament in having given such powers, observe:—

First.—That when the power of purchase was granted in 1882 and 1888, no such schemes of supplying energy in bulk were contemplated as are now before Parliament.

Secondly.—That when the power of purchase was thus granted, the question then before Parliament was chiefly one of light; whereas the evidence given before the Committee shows that although electric light is at present the predominant feature of the enterprises now before the public and Parliament, the application of electrical energy in the form of power to an infinite variety of other purposes is likely to be in the near future the predominant feature and function of these undertakings.

Thirdly.—It does not appear to them that an undertaking supplying energy in bulk at high voltage and in comparatively few mains is, as a rule, so desirable for the local authority to acquire as a low voltage undertaking with many distributing mains.

The Committee think the provisions of the Electric Lighting Act, 1888, enabling the local authority to purchase an undertaking after a term of years, inapplicable, as a general rule, to the case of an undertaker supplying energy in bulk at high voltage, but there may be special cases where it is desirable that the local authorities should have the right to purchase reserved to them. To meet such cases they suggest that the Board of Trade should have power to insert the purchase clause in the provisional order, if the local authorities concerned can, in the opinion of the Board, show good cause for such a course.

It is to be observed that the exemption from liability to compulsory purchase would not prevent local authorities, either alone or in combination with other local authorities, from applying for powers to purchase, but each case would have to be judged on its merits, and such conditions imposed as might be thought fit.

In cases of the exemption from liability to purchase, it would be specially expedient in the interest of the consumers that some kind of sliding scale, as in the case of gas undertakings, should be imposed.

In connection with this question of purchase under Section 2 of the Act of 1888, evidence has been given to the effect that with a view to secure in London one and the same time for the execution of the powers, the Board of Trade have in some cases imposed upon undertakers a less term than 42 years within which they are liable to be purchased.

The Committee suggest that if the full period of 42 years is not granted, and if a substantially shorter period is imposed by the Board of Trade, the terms of purchase should in each case be reconsidered.

The Committee consider that the provisions of the Electric Lighting Act, 1888, which require the consent of the local authority as a condition precedent to the granting of a provisional order, should be amended. In their opinion, the local authority should be entitled to be heard before the Board of Trade, but should not have, so to speak, a provisional veto, only to be dispensed with in special cases by the Board of Trade.

With respect to conditions, the Committee think it reasonable that where a local authority, or company having power to supply light within a certain area of supply, seeks to obtain compulsorily land for a generating station outside that area, it should not be allowed, except where Parliament or the Board of Trade decide otherwise, to supply from that generating station any area outside the area of supply of such authority or company.

With regard to the powers of purchase conferred by Section 2 of the Act of 1888, they are of opinion that local authorities should be empowered to purchase undertakings partly outside their area of supply on terms agreed upon by the Board of Trade.

PROVISIONAL ORDERS.

The ordinary clause which forbids any connection with the earth, except with the approval of the Board of Trade, and the concurrence of the Postmaster-General, should be inserted in every case.

As to protection of telegraphs and telephones, the clauses now inserted in provisional orders seem to be sufficient in all ordinary cases, and regulations to protect the public can be made by the Board of Trade under Section 6 of the Act of 1882.

The clauses which protect gas and water-pipes have worked satisfactorily, and should be continued; but the Committee would direct attention to the observations of Mr. Preece as regards the difficulty arising from the working of tramways by trolley wires; his suggestion as to a strong "control clause" should be carefully considered.

They are disposed to concur generally with Lord Morley and Sir C. Boyle in thinking that, as compulsory powers are given solely for the benefit of the public, it would be desirable to make some provision against these companies being subject to foreclosure on mortgage, and against their rolling stock and plant being liable to distress.

The Committee have directed the minutes of evidence, together with an appendix, to be laid before your Lordships.

Though not directly connected with the matter of the above report, the following discussion which took place on Tuesday night in the House of Commons is of considerable interest. Our report is taken from the *Times* of Wednesday.

On the order for the second reading of the Electric Lighting Provisional Orders (No. 12) Bill, which is to enable the local authorities of Bermondsey and Marylebone to lay down mains for the supply of electric energy, although it can be done by private enterprise under statutory powers which have been conferred,

Mr. CRIPPS (Gloucester, Stroud) moved the rejection of the Bill, remarking that the Bill raised some of the most important questions which could possibly be raised in connection with our industrial policy, and there was a principle involved which, if sanctioned by the House, applied not only to electric lighting companies, but to all industrial companies whether for the construction of tramways or the supply of gas and water. He spoke in no sense on behalf of the companies involved. He had no connection with them, and no interest in them whatever. The question was whether a private company authorised by Parliament to carry on an industrial undertaking, and which had admittedly carried out all its obligations to the public, should by means of rate-aided competition be be liable to what was, in substance, expropriation without compensation. This was an insidious and dangerous infringement of the recognised principle of security—that every man should be compensated before his property—particularly property guaranteed under an Act of Parliament—could be attacked or depreciated. There was no precedent for the proposition before the House. Where a private company did its duty with statutory powers, and against which no allegation of mismanagement was made, it was only right and fair that it should be bought out before anything in the nature of rate-aided competition was allowed. The principle applied not only to electricity, but to gas and water undertakings. It has been justified, and properly, from two points of view, that it was the only fair way of treating those who had invested under the guarantee and faith of Parliament, and that, unless the local authority sought to purchase, rate-aided competition was wasteful and wanton extravagance. No private enterprise could, in the long run, hold its own with rate-aided competition, and where once Parliament had sanctioned private enterprise it did not allow it to be unfairly crushed. There was no case here of a company not doing its duty and not fulfilling its obligations. They had the assurance in this case of the local authority that the company was amply and properly fulfilling all its duties within its district. They therefore came back to

* Lord Blackburn's opinion is in these words: "It is now thoroughly well established that no action will lie for doing that which the Legislature has authorised, if it be done without negligence, although it does occasion damage to anyone; but an action does lie for doing that which the Legislature has authorised if it be done negligently. And I think that if by a reasonable exercise of the powers either given by statute to the promoters, or which they have at common law, the damage could be prevented, it is, within this rule, negligence not to make such reasonable use of their powers."

the pure question of principle of whether it was fair, where a company had invested its capital on the security of Parliament that the concession was for 42 years, that the ultimate purchasing authority should be allowed to come in, and, by means of rate-aided competition, to depreciate the company's property or to crush out private enterprise altogether. He moved that the Bill be read a second time this day six months.

Mr. Kimber (Wandsworth) seconded the motion for the rejection of the Bill. Although in the Act of 1888 it was provided that the fact of a private company having received a provisional order should not prevent the Board of Trade from giving another order to a local authority, it was implied that the Department should exercise the power delegated to it upon principles of equity. The Board had the duty, with the power, to see that the recipients of the provisional order performed the duties required, but the Board of Trade misconceived its duty if it deliberately exercised its arbitrary confiscatory power, saying to a local authority "take possession of the undertaking of this successful company, it will enable you to reduce your rates." The Board of Trade was a *quasi*-judicial body and should exercise its powers on principles of justice.

Mr. Stuart (Shoreditch, Hoxton) said the speech of the hon. and learned member who moved the amendment was an argument against the Act of 1888; it was now quite out of date. This was no new raid of an unusual kind. In the Act of 1888 it was distinctly provided that the grant of authority to any undertakers to supply electricity within an area "shall not in any way hinder or restrict the granting of a provisional order to the local authority." There was no more to be said about the matter except that these words were introduced into the Act of Parliament as the result of a prolonged negotiation and after a due consideration of all the circumstances of the case.

Mr. Lafone (Southwark, Bermondsey) supported the provisional order, contending that where a company had neglected to do its duty, the local authority should be enabled to step in and do the work.

Sir A. Forwood (Lancashire, Ormskirk) observed that when the Act was passed with the clause reserving power to the Board of Trade to concur in the granting of licenses, that was regarded by the municipalities as a protection to them from the monopolies which had been created by gas companies in previous years. Feeling they had that protection, they did not oppose the obtaining of provisional orders by private parties. Had it been supposed that by not opposing the provisional orders they were going to hang round the necks of the municipalities a monopoly such as that which had been hung round by the gas companies for years, the corporation of which he was a member would have strenuously opposed the passing of any provisional order which would have had that effect. The various private lighting companies had accepted these orders under the conditions of the Act of Parliament which had been quoted. The shareholders knew perfectly well the risks and conditions under which they entered into the businesses and invested their money, and it would be a mistake at this stage to take away from the Board of Trade or municipalities the powers reserved to them under the Act. The clause in the Act of 1888 was a reasonable protection to the municipalities against monopolies, and an adequate protection against undue pressure on the part of municipalities. He thought these electric lighting systems were likely to be taken up very largely by municipalities. This country was sadly behindhand in the matter of electricity. It was a century (*sic*) behind the United States in this respect. In America they had established enormous central power stations, from which not only did they provide for the lighting of a district, but they generated the power for electric tramways and for small industries. What could be more calculated to improve the condition of the people than to enable a small manufacturer to take into his workshop sufficient electrical power to enable him to produce articles, in competition it might be, with larger undertakings? Electric lighting would soon become like gas and water, a public necessity, and such it ought to be in the hands of the municipality.

Mr. Bartley (Islington, N.) said he was doubtful of the wisdom of local authorities embarking on those undertakings; but there was no doubt that the spirit of the age in London was for local authorities to embark on them. There was no doubt also that words were expressly inserted in the Act of 1888 to prevent companies from securing a monopoly of electric lighting in their various districts, and therefore the companies entered on these enterprises with their eyes open. If London municipalities were to be debarred from entering upon these undertakings, it would be very bad for the Government side of the House.

Mr. Knox (Londonderry) thought the House should have some guidance from the Board of Trade in the matter. There were two cases dealt with in the provisional orders—Bermondsey, in which the company had not performed its duty, and Marylebone, in which the company had provided a good service. The object of the Act of 1888 was to give security to any company which gave a good service, and to protect the public against inefficiency and overcharge. But the Board of Trade had given to the local authority in Marylebone competitive powers with the existing company in an area which was being well served by the company. That appeared to him to be going beyond the Act of 1888. If private capital were deterred by such action of the Board of Trade from entering upon these undertakings it would not in the end be for the good of the community.

Mr. Ritchie (Croydon) said he desired to tell the House the position of the Board of Trade in regard to this matter. Applications for provisional orders were not received by the Board of Trade from the local authorities of Bermondsey and Marylebone alone. In one case the local authority and a private company, and in the other case the local authority and two private companies applied for provisional orders for a second supply of electric lighting in their respective districts. The Board of Trade had to consider, first, whether or not any additional provisional order should be granted; and if the provisional order were to be granted, whether it was to be granted to a private company or to the local authority. He had no hesitation in deciding that it would not meet with the approval of Parliament if the Board of Trade were to reject the application from the Vestry and to give the additional provisional order to another company. The hon. and learned member for Stroud had contended that as long as the existing company was properly discharging its duty no second order should be granted in the locality. The meaning of that was that a monopoly was to be given in each area to the company which first obtained the order. That was not only contrary to the public interest, but absolutely contrary to the direction of Parliament. The Act of 1888 clearly showed the intention of Parliament to be that a second order might be granted in any locality, either to the local authority or to another company. Subsequently to the passing of that Act an inquiry was held by Major Marindin as to the conditions under which provisional electric lighting orders might be granted in the metropolis; and he laid it down distinctly that two companies might be granted an order in each area. Therefore it could hardly be said that a company applying for an order after the Act of 1888, and after this inquiry of 1889, did not do so with its eyes open to the possibility of competition. Hon. members had shown that the competition of a local authority might be keener than that of another company, but the Act of 1888 having expressly provided that a local authority might apply for and be granted an order, it was impossible for the Board of Trade to have adopted any other course in this case than that which they had taken. The Board of Trade had not gone into the merits of the case; that was left to the Committee of the House. If the Board of Trade had refused either of these orders Parliament would have been precluded altogether from considering the applications. His view of Section 1 of the Act of 1888 was that it imposed on the Board of Trade the duty of receiving applications, and, unless there was some strong reason other than those which had been advanced, to grant the order in order that it might come before Parliament. If the House of Commons rejected the Bill on its second reading it would not be in accordance with the traditions of the House or with public policy.

Mr. Bryce (Aberdeen) said that the right hon. gentleman had shown that the Board of Trade had no option but to send these proposals to the House. Further, the House was bound to send them to a Committee, for otherwise the Act of 1888 would in effect be repealed. It seemed to be taken for granted that the present lighting arrangements in Marylebone were quite satisfactory. As a matter of fact he, as a resident, knew that that was far from the case. He hoped that the House would support the Board of Trade.

Mr. Brodrick (Surrey, Guildford) wished to corroborate what had been said by the right hon. gentleman of the electric light supplied by the Marylebone Company. It had been assumed throughout the discussion that the supply was satisfactory. He could assure the House that those who had the light in their rooms had made many complaints. When it was proposed to grant a monopoly for 32 years this should be considered by the House.

The House then divided—

For the amendment	114
Against	198
Majority against	—84

The second reading of the Bill was then formally agreed to.

Mr. Cripps moved that the Bill be referred to a hybrid committee.

Sir W. Harcourt (Monmouthshire, W.) asked why it should be dealt with differently from other Bills. They knew the sort of influences to which the House was exposed in regard to Bills affecting private companies, and the sort of solicitation made on Bills of this description. The hon. and learned member had given no reason why the Bill should be dealt with exceptionally. But probably he thought that in a hybrid committee he would have a better opportunity than he now had of defeating the measure.

Mr. Cripps said that, after the statement of the right hon. gentleman, he would withdraw his motion.

The motion was, by leave, withdrawn.

LONDON COUNTY COUNCIL.

Telephones and Generating Stations.

Mr. McKinnon Wood (chairman of the London County Council) presided on Tuesday afternoon at the County Hall, Spring Gardens, over a conference of members of the Council, and the representatives of Metropolitan local authorities. The conference was called to consider the question of telephones and also the report of the Joint Committee on Generating Stations for Electricity in Bulk.

The Chairman in opening the proceedings expressed the great gratification he felt at the representative character of the gathering, and said he had never known a more representative body of local authorities assembled in that hall before. As they knew, a conference of provincial authorities had already been held, for the Council considered the matter was of national importance. At that gathering he was struck with the unanimity which prevailed, and there seemed to be a feeling, with no dissention whatever, that the telephone service at present was grievously restricted, and that reduced cost and improved efficiency would cause very great development. They also protested very strongly indeed against the claims made to break up the streets and override the authority of the local authorities. With regard to London they had a special grievance, for they had the dearest system of all, and they felt that there was a very wide field for extension in the Metropolis. Now only those engaged in extensive commercial transactions used it, and it would be a great advantage if it could be used in smaller businesses; therefore, they felt it most desirable that those who represented all the districts in London, should, if possible, unite in placing their views before the committee which was thoroughly investigating the subject. With regard to the other question, that of generating stations for the supply of electricity in bulk, they had a direct interest in that, and he felt that in the near future that interest would be greatly increased. Consequently it was considered expedient to discuss that question also at the conference.

Mr. Beachcroft pointed out that it was important that the evidence given before the Joint Committee should be before them to enable them to come to a conclusion.

The Chairman: I believe the report of the committee has been circulated.

Mr. Ogilvie (Lambeth) in proposing the first resolution, said that the National Telephone Company, having taken the wrong line at first, persisted in sticking to it. It seemed that the Post Office had gone body and soul over to the company, but he thought the telephone was not a thing out of which private companies should make profits. The service was both costly and inefficient. The company had paid large sums in buying up opposition, and the users had to pay for it. He moved:—"That in the opinion of this conference the present telephone service of the London area, as supplied by the National Telephone Company, is both inefficient and and inadequate; that the charges, as compared to those made by the same company in the provinces, are much too high, and that these disadvantages to London are largely due to the abandonment by the Post Office of that principle of competition which was expressly adopted prior to 1892 for the protection of telephone users."

This was carried without discussion.

Mr. John Smith (St. George's-in-the-East) moved, and Mr. Mortimer (Rotherhithe) seconded, the following motion:—"That this conference views with alarm the action of the Post Office in using, for the benefit of the National Telephone Company, its special powers as to the breaking up of streets, as instanced in the recent case of the Commissioners of Sewers and the Post Office; and urges the Select Committee on Telephones, which is now sitting at the House of Commons to preserve intact that control over the streets which has hitherto been vested in the municipal authorities.

Mr. Dewey (Islington) while against any interference with the streets, contended that the local authorities could not give the company permission to break open the streets, inasmuch as the Telephone Company had no statutory powers whatever for the purpose of breaking up streets or laying their mains. At present they were placed in the invidious position of being told that they placed obstacles in the way of the company giving a proper service, but the vestries had no power to give the permission. He knew that local authorities had given consent, which he ventured to say they had no right to give.

Mr. Begg (Limehouse) said they had allowed the company to lay their mains under their streets for five years, but the public had received no benefit and the company would not get an extension. Their clerk said they had the right to give permission, and he was as good a lawyer as Mr. Dewey.

Mr. Benn (L C.C.) trusted that one result of the conference would be to band the vestries together to fix a universal charge as rent for their streets. It was a question whether the London County Council could extract a rent, but the vestries, if they combined together, might get a considerable sum.

Mr. Beachcroft (L.C.C.) said the motion was of wide application, because the question of the Council's position in regard to the streets of local authorities if the Postmaster-General granted them a license would have to be considered.

After further discussion the motion was carried.

Mr. Kimber moved a resolution to the effect that considering the great public importance of the telephone, it should be taken over by the Post Office and worked as part of the postal service of the nation. He contended that the only way to get an efficient service was to have it worked under one management.

Mr. Ridley (Wandsworth) seconded the motion. It was supported by delegates from Greenwich, Lee, and Clerkenwell.

A discussion took place between Mr. Benn and Mr. Kimber as to altering the terms of the resolution so as to exclude the words "take over the system," but Mr. Kimber said he did not believe in confiscation.

Eventually, Mr. Benn proposed the following amendment:—"That in the opinion of this conference, the telephone system is of such general public importance, and calculated to become of such general benefit, that it should no longer remain exclusively in the hands of a trading corporation, but should be worked by the Government as part of the postal service of this country."

This was carried.

A motion of Mr. Lyon (Camberwell) respecting the means to be taken to combine for a telephone service was discussed at some length, and having been amended, was carried as follows:—"That in the event of the Government not undertaking the telephone service, it is desirable that the local and central authorities of the London telephone area should at once combine to secure an efficient and cheap municipal telephone service."

It was agreed that the chairman should place the resolution before the Select Committee now sitting.

Mr. Benn said that with regard to the generating stations, it was proposed to erect large generating stations to supply electricity in bulk, and the companies promoting such schemes wished to set aside the provisions of the Electric Light Act of 1888, as regarded area and supervision of the purchase clauses. The general principles embodied in these Bills were being considered by the House of Commons, and unless there was some definite proposal brought forward by the Council and local authorities they would probably be passed. One of the results might be that a local authority on acquiring the electric lighting service within its area might find its supply cut off. He thought the Council, as the central authority, should have the power to purchase the bulk companies.

Mr. E. J. Wakeling (Shoreditch) moved: "That this conference regards it as essential to the interests of London as a whole that the present purchase clause of the Electric Lighting Acts, which applies to defined areas, should also be made to apply to such companies as propose to supply electrical energy in bulk to the whole of London without regard to area."

The following motion was also carried on the motion of Mr. E. Howes (St. Luke's): "That while preserving intact the rights of the local authorities with regard to electric lighting and energy, in the opinion of this conference it is desirable that the London County Council should be in a position to undertake, if it so determine, and if so requested by the local authorities, the supply of electrical energy in bulk for the convenience of any districts desiring to be so supplied, provided they do not become competitors with the local authorities."

CORRESPONDENCE.

Purification of Sewage Effluent by Electrozone.

After reading the article in your issue of April 29th, entitled "The Purification of Sewage Effluent by Electrozone," it occurs to me that the results of an extended and systematic investigation which I carried out some time since in the same line may be of interest.

The purpose of the experimental work was to determine how much "available chlorine" is produced per ampere-hour under various conditions of current density, solution density, &c., in solutions of sodium chloride, and magnesium chloride, and also in mixtures of the trio.

I enclose a table which fairly summarises the results obtained, and is self-explanatory. It is somewhat startling to have the so-called "experts" you mention find the exceedingly huge production of 1·45 gms. Cl. per litre when, according to Faraday's law, the maximum amount possible could be but 1·32 gms.

My experiments were carried out by electrolysing four litres of solution, containing the amounts of salts indicated in the table. This quantity should be sufficient to give a good indication of what we may expect of the process on a commercial scale, besides determining the conditions under which the "available chlorine" is produced most economically.

In several instances the temperature was kept constant at about 11° C., otherwise it was allowed to rise, due to the C^2 R loss in the electrolyte.

The much better results found under this condition of low temperature pointed out very clearly the necessity of keeping the electrolyte at a low temperature.

M. C. Beebe.

Madison, Wis.

[There is no occasion for publishing Mr. Beebe's table. He does not tell us what kind of electrodes he used, and his laboratory experiences do not seem to be of any particular interest.—Eds. Elec. Rev.]

"Honour to whom Honour is Due."

Within the past week, Mr. James Wimshurst, "the inventor of the famous electrical machine," has been elected a Fellow of the Royal Society. Your article that sought to detract from his claims to that honour, has consequently failed in its main purpose. In your last issue you revert to my former criticism, and you cite various German and French authorities to show how great are the claims of Hr. W. Holtz. I have already admitted the greatness of those claims; indeed, anybody who reads Holtz's admirable papers in *Pog. Ann.* and elsewhere, must always acknowledge him the father of the "influence" machine. But he was only the father. He did not gather into one mechanism the sum of his ideas. This was reserved for Wimshurst. The Wimshurst machine is self-exciting; its polarity is subject to no capricious reversals; it does its work well in all weathers; its discharges can be regulated as to quantity, potential, and rate of interruption; and it is, for some purposes, the best possible exciter for Röentgen-ray tubes. Holtz never made a machine that combined those merits.

It is a curious and significant fact that the most modern

Holtz machines are provided with an auxiliary exciter of the Wimshurst type. This is a very proper arrangement, and indicates the exact relationship that should exist between the honoured inventors themselves.

The letter of Hr. Uppenborn consists of two parts; in the first he cites his own book, in the second he gives us a measure of his judgment. It is always a pity to deny a Teuton the luxury of a grievance. Has Hr. Uppenborn forgotten the wise saying of Karl XII.: "Wenn mancher Mann wüste, was mancher Mann wär, thät mancher Mann manchem Mann manchmal mehr Ehr."

Rollo Appleyard.

June 14th, 1898.

Ring Slotted Armatures.

I should be very much obliged if any person could inform me that when designing a ring slotted armature if the section is calculated as if the slots were solid, or how is it calculated, or what allowance is made for slots?

Also supposing the slots were a quarter of an inch wide, would the air space between armature and fields be one-eighth of an inch on each side of armature, or what proportion of width of slot would the air space on each side be?

Subscriber.

Melbourne.

Section of the drum slotted armature is found by taking the diameter across from bottom of slots to bottom of slots. The air space or clearance should be equal to half the breadth of the teeth; in calculating the reluctance of the air space in a slotted armature, the breadth of the teeth multiplied by their number embraced by the poles will give the area of the air space.

Slots should be same width as breadth of teeth; the air space is regulated by breadth of the teeth, not by width of slot.

In a ring armature the section is taken from bottom of slot to inside of ring.

The tendency of recent designs is to make the slots narrow, numerous, and deep; tooth and slot about equal, and the magnetic density in the air space is run up to 10,000 units or double that of a smooth core.

R. Kennedy.

Prof. Carus-Wilson's Paper.

Will you kindly correct a slip in my letter published last Friday to the effect that, in the two curves which I selected for comparing the results obtained with constant and with variable acceleration, the same final speed held for both.

As a matter of fact the figures which I gave at the Institution erred in the same direction as did those of Mr. Short; but the question at issue is not materially affected thereby, so it is sufficient to just mention it.

There was an obvious slip, also, in the employment of the word "acceleration" instead of the word "speed" (at the foot of the page in your issue of Friday last).

I should like to add that my remarks at the Institution, and in my letter to you last week, were based on the assumption that Prof. Carus-Wilson's paper was intended to deal more particularly with high-speed *railway* motors as we understand the term in this country; *i.e.*, with motors hauling trains of carriages between fixed, starting and stopping points, and at a high rate of speed; such as the Central London, the Waterloo and City, the Liverpool Overhead, and the City and South London Railways.

My remarks as to adhesion were based on the values found to hold in the case of the two latter.

A. M. Taylor.

BUSINESS NOTICES, &c.

Books Received.—"The Calorific Power of Fuels." By Herman Poole, F.C.S. London: Chapman & Hall, Limited. $3.

"Acetylene Gas and Calcium Carbide." By G. F. Thompson, Lombard Chambers, Bixteth Street, Liverpool. 3s. 6d.

"Duncan's Manual of Tramways, Omnibuses, and Electric Railways," 1898. 3s. 6d. London: T. J. Whiting & Sons, Limited, 7A, South Place, E.C.

"Electricity in Town and Country Houses." By Percy E. Scrutton. Archibald Constable & Co., 2, Whitehall Gardens. 2s. 6d.

Electric Cooking.—Messrs. Crompton & Co., Limited, Arc Works, Chelmsford, have issued a new edition of their catalogue of electrical heating and cooking apparatus. The list, which consists of about 40 pages, describes the various domestic and other apparatus manufactured under the Crompton-Fox patents. It is claimed that, in the method of attaching the utensil or apparatus, the wires are firmly secured in place on an insulating ground work, and completely protected from the action of the atmosphere, and also from mechanical damage, by a coating of a strong vitreous enamel of very high insulating properties, and capable of thoroughly withstanding the heat of the wire itself. The wires which generate the heat can be fixed in very close contact with the article to be heated, thus giving a high efficiency, and the methods by which this is done are the result of over eight years' experience. The list gives prices and particulars of a variety of hot plates, saucepans, fry pans, flat irons, radiators, &c. The prices of certain articles are considerably reduced. Messrs. Crompton also send us a copy of a pamphlet by Mrs. Seaton, giving practical hints on the use of electrical cooking apparatus, and instructions for using electric heating appliances.

Electric Lighting of Tin Plate Works.—Morfa Tin Plate Works, Llanelly, are following in the wake of other works of the same kind in this centre of the Welsh industry by securing an installation of electric light. The contract has been given to Messrs. J. C. Howell, Limited, Llanelly. The work will be commenced shortly.

Electrical Plant for Australia.—The machinery for the lighting of the City of Goulbourn, N.S.W., is being built by Messrs. Johnson & Phillips, of Old Charlton, the order having been handed to them by their sole representative in Australia (Mr. W. W. Crawford, consulting engineer, Imperial Chambers, Sydney, and Brookman's Buildings, Adelaide), who is at present on a visit to London. This firm have also in hand the order for plant for lighting Port Adelaide, South Australia.

The Jandus Arc Lamp.—Messrs. Drake & Gorham inform us that the gold medal was awarded to the "Jandus" arc lamp at the recent Hull Exhibition. The firm also exhibited a selection of their specialities in electric light fittings, which was awarded a silver medal. The same firm also show some good specimens of art metal work at the Exhibition now being held at the Royal Aquarium. Amongst other fittings can be seen French candelabra and sconces of the best designs, and a special feature of the exhibit is an attractive collection of old Dutch fittings and Japanese bronzes adapted for the electric light.

Nernst Incandescent Lamps.—Messrs. Ganz & Co., of Buda-Pesth, have purchased the Austrian, Hungarian, and Italian rights in the Nernst process for the manufacture of incandescent lamps. We believe we are correct in saying that the rights for this country and the Colonies respectively have been purchased by two well-known companies.

New Premises.—Mr. James Morris has opened new premises in Railway Road, Leigh, Lancashire, as an electrician, optician, and photographic dealer.

Messrs. Palmer & Watson, electric light and power engineers, 100, Charing Cross Road, have again to extend their business premises, and they will shortly open a showroom for electrical fittings and appliances on ground floor at the above address.

The Ventnor Electric Light and Power Company have opened premises in High Street, Ventnor, for the supply of electric light fittings, &c.

Messrs. Dobsons & Curtis Bros., Limited, electrical engineers, of Dublin, have opened an office at 74, South Mall, Cork. Mr. L. E. Buckell is in charge of the branch.

Salmony v. Kitching.—In the Hull County Court last week Messrs. H. M. Salmony & Co. sued Mr. C. H. Kitching, electrician, Beverley Road, Hull, for £18 16s. 1d. for goods sold and delivered. Mr. Stamp said that on September 7th the defendant was endeavouring to obtain the agency for Hull and district for the plaintiffs' firm, and saw Mr. Rosenberg, a member of the firm, who was in Hull, and then ordered verbally a quantity of electrical goods. The order was subsequently taken down in writing at the defendant's dictation. Dr. Jackson (for the defendant) explained that 13s. 10d. admitted had been paid into court, and £7 14s. 6d. was paid into the High Court, whence the case had been transmitted. Mr. Stamp, continuing, said that the order was given on September 7th, and the real question in dispute was whether the defendant was entitled to return certain lamps on the ground that they were ordered of the Electrical Company's make, and not so supplied, but someone's else At the time, however, nothing was said as to any lamps whatever. The plaintiffs did not manufacture lamps, and the defendant was endeavouring to obtain the agency for the plaintiffs' firm. The firm whose lamps it was afterwards alleged were sent, were the direct competitors of the plaintiffs' firm, and neither of the firms actually made lamps. They were supplied from Berlin. On the 14th of the same month the defendant wrote complaining that the lamps were very unsatisfactory, and informing the plaintiffs that he was going to send them back as he declined to receive them. On September 25th plaintiffs sent 716 lamps at 7s., and 72 lamps at 1s. 1d. each in two boxes and a few other goods in a barrel. On October 26th plaintiffs received back an empty barrel, and gave defendant a credit note of 5s., and on October 27th they received two boxes of electrical goods, for which they also gave credit. On November 27th defendant for the first time complained that he had not received proper credit. The plaintiffs now claimed that they had not received 621 lamps which it was alleged were returned, and for them they now claimed £18 2s. 3d. Dr. Jackson contended that there had been no contract made, and that the goods sent were of an inferior quality and were sent back, and at present were in the possession of the plaintiffs' agent. His Honour gave a verdict for the amount claimed, with costs.

Bankruptcy Proceedings.—At a sitting of the London Bankruptcy Court held last Friday, Wm. Retallack was allowed to pass his public examination upon accounts showing debts £568 6s. 10d., and no available assets. In the course of his evidence the bankrupt said he commenced business as a manufacturer of electrical appliances in 1882, at Canonbury Square, N., in partnership with another as "Player & Retallack." In all he had had five partners, but during the latter part of the trading he was the sole proprietor of the business, which was abandoned because the trade had fallen away and could not be continued at a profit. His insolvency was due primarily to loss on the trading. The examination was concluded.

At the Sheffield Bankruptcy Court a few days ago, before the Registrar (Mr. Joseph Binney), John Henry Dewhurst and John Longden, lately carrying on the business of mechanical and electrical engineers and mill furnishers, Attercliffe Road, under the style of John Dewhurst & Son, came up for their public examination. The statement of affairs showed liabilities amounting to £2,143 13s. 9d., and assets estimated to realise £100. Debtors were represented by Mr. J. E. Wing. The examinations were closed.

A meeting of the creditors of James Fletcher and John Arthur Hirst, carrying on business under the title of Messrs. Fletcher, Hirst and Co., electrical and mechanical engineers at Burnley, Chester, and Derby, was held at the offices of Mr. C. J. Dibb, official receiver, in Quay Street, Manchester, on Tuesday last. The liabilities amounted to £2,184, and the assets to £424, a deficiency of £1,760. Debtors were adjudicated bankrupt, and Mr. George Proctor, of 3, Grimshaw Street, Burnley, chartered accountant, was appointed trustee of the estate. A committee of inspection was also appointed.

In the Manchester Bankruptcy Court last Monday, R. C. Douglas formerly carrying on business as an engineering contractor at Bradford, and some time in partnership with others, under the style of "The Manchester Electric Company," at Haworth's Buildings, Cross Street, Manchester, was examined by the Official Receiver. His statement of affairs showed a surplus of assets over liabilities of £1,036, and he attributed his failure to inability to obtain payment of amounts which he claimed from certain persons. The examination was adjourned.

Auction Sales.—On June 20th and 21st, Messrs. Robins, Snell & Gore will sell by auction, at 219A, Oxford Street, W., the entire stock of an electrical contractor, including accumulators, switches, arc lamps, motors, cycle lamps, &c. See our "Official Notices" this week for further details.

Messrs. Percy Huddleston & Co., will sell by auction at 11, Long Millgate, Manchester, on June 30th, a quantity of electrical apparatus, &c., for particulars of which see our "Official Notices" this week. The list includes dynamos, motors, 10,000 switches and fittings, cables, and wires, &c.

Change of Address.—The offices of the Brockie-Pell Arc Lamp, Limited, have now been removed from 97, Queen Victoria Street, E.C., to 21, 23 and 25, Tabernacle Street, E.C.

Lists.—Messrs. Crompton & Co. are circulating a price list of enclosed long-burning arc lamps.

The Davy Electrical Construction Company, Limited, of Highbury, send us a number of lists illustrating and describing their types A, B, and C enclosed arc lamp.

Messrs. Beanland, Perkin & Co., of Leeds, have issued a list of electric air propellers, table ventilators, and small motors.

The Langdon-Davies Electric Motor Company, Limited, have issued a new list of their alternate current motors. A catalogue will be brought out in a few weeks.

Messrs. Foxcroft & Duncan, of 24, Queen's Road, Dalston, N.E., send us a set of lists of their various manufactures, including gravity and dead-beat voltmeters and ammeters, permanent magnet ditto, Cardew voltmeters, "Phœnix" and "S.S." arc lamps, hatchet switches, resistances and choking coils, &c. The firm make all the measuring instruments as formerly manufactured by Messrs. Paterson and Cooper, of Dalston, including the Ayrton and Perry commutator and non-commutator instruments. The gravity instrument mentioned above has been only lately introduced.

Smoke Nuisance.—The London Electric Supply Corporation, who were recently fined for a smoke nuisance, have given notice of appeal to the Greenwich Board of Works. Two more cases of nuisances having been reported, the Board have decided to proceed against the parties concerned.

ELECTRIC LIGHTING NOTES.

Barmouth.—On 7th inst. the District Council held a special meeting to consider the question of lighting the town by electricity. A proposal was put forward by Mr. Dd. Davies, of Beach Road, who offered to destroy the refuse for 5s. a day, and put down an electricity works, the wires to be laid underground, the work to be completed in 18 months, and a guarantee to be given to supply electric light for five years on terms to be agreed upon. The Council agreed to support Mr. Davies's scheme, and he is to submit plans.

Barnsley.—Mr. Miller, electrical engineer, has been instructed by the Council to prepare plans, estimates, &c., for an electric lighting scheme. Application is to be made to the Local Government Board for a £23,322 loan. It was stated last week at the Council meeting that there was such a large demand for electrical materials that it might be 18 months before the scheme would be completed.

Barrow.—The Electric Lighting Committee has appointed a sub-committee to superintend the erection of buildings and the carrying out of works in connection with the electric lighting undertaking. The sub-committee will negotiate for sites for the erection of sub-stations. The electrical engineer has been authorised to engage the necessary staff for breaking up the streets to lay mains. Before the mains are laid, the Highways and Lighting Committee are to be asked whether they contemplate street lighting by arc lamps. It is expected that current will be available by the end of October.

Belfast.—The engineer last week reported the progress of the works at the new electricity station, and the successful testing of the first and second boilers. It was decided to advertise for a fully qualified man to act as engineer-in-charge.

Bethnal Green.—In regard to our last week's paragraph under this heading, Messrs. Calvert & Co., electrical engineers, 4, St. Mary's Street, Manchester, write calling attention to a slight inaccuracy in the report. They say:—"The Board of Guardians accepted a tender of ours apparently without reading it, and then requested us to sign a contract containing a clause 'in accordance with the specification and plans prepared by the engineers but *not* in accordance with the said tender.' We offered, we did not *demand*, as the original tender was the one accepted—an addition at which we would be willing to sign the draft contract with the inclusion of a minor protectionary clause. This offer, as you know, was not accepted. We have been asked to send in a fresh tender, the work being re-advertised."

Birmingham.—At the City Council meeting on Tuesday, the Lord Mayor submitted the recommendation of the General Purposes Committee as to the purchase by the Council of the undertaking of the Birmingham Electric Supply Company, Limited, at the price of £420,000, and authorising the committee to take the necessary steps for the promotion of a Bill in Parliament to authorise the purchase. The recommendation of the committee was that they should pay £10 10s. per share for the £5 shares of the company, and take over the undertaking as a going concern, with all its assets and liabilities, as from January 1st, 1898. There was no opposition to the scheme, and the recommendation of the committee was agreed to. The voting was 53 for, 0 against, and 5 neutral.

Blackpool.—At a meeting of the Town Council on Tuesday last week, Councillor Brodie, as chairman of the Electric Lighting Committee, presented a statement as to the working of the department during the past financial year. This showed that the working of the tramways had realised a gross profit of £5,290, and after paying £2,984 for interest on capital and sinking fund, there was a net profit of £2,306 on the working, as against £230 in the preceding 12 months. The gross profits in the electric lighting department were £5,675, and with £3,856 placed to sinking fund and interest on capital, there was left a net profit of £18,190. Councillor Brodie said some complaint had been made on the ground that the Committee were making a profit, and demands put forward for a reduction in price. He referred the Council to what occurred two years ago, when the whole of the cables failed involving an unexpected expenditure of £13,700. Had there not been a suspense account the ratepayers would have been taxed very heavily to repay that amount; and the Council were determined that until this suspense account was put right again the users of electricity should not have the benefit of any reduction. He added that it was proposed to spend a sum of £40,000 in extensions. The statement was adopted. At the same meeting the salary of Mr. R. C. Quin, the electrical engineer, was advanced from £300 to £400 per annum.

In response to a requisition signed by a large number of ratepayers, the Mayor of Blackpool has convened a public meeting for the purpose of considering the proposal on the part of the Town Council to borrow a further sum of £40,000 for extensions in connection with the electric lighting scheme. The petitioners to the requisition assert that the ratepayers generally desire fuller information as to the expenditure by this department of the Corporation since the inauguration of the works. The undertaking was commenced five years ago with a capital of £26,000, but in subsequent years other sums, amounting to £54,000 were expended, so that if the present application for £40,000 is granted the capital will be raised to £120,000. Upon this large expenditure, and also in regard to the overhead system, many of the ratepayers apparently hold strong opinions.

Bray.—The Township Commissioners have decided to reduce the price of electric current from 6d. to 3½d. per unit after one-and-a-half hours' lighting of maximum demand.

Bridgwater.—The Somerset Drainage Commissioners will oppose the electric lighting Bill for Bridgwater when it is heard.

Burslem.—Last year when the Council passed its resolution applying for a provisional electric lighting order, it was too late for anything to be done. A second resolution has now been passed, and the application will go forward.

Burton-on-Trent.—We understand that, in addition to a large sum voted for gas extensions, £11,000 is to be spent upon electric lighting extensions.

Buxton.—Prof. Kennedy's plans, &c., of an electricity undertaking are before the Council, which has held a special meeting to consider them.

Camberley.—Mr. Lucas, of Bournemouth, is anxious to carry out the electric lighting of this district at a cost of £25,000 or £26,000, and last week he met the District Council and explained in outline his proposals. During the last three years Mr. Lucas is said to have expended £40,000 in the locality, and is to build a number of additional houses shortly. The scheme would extend from the schools to the Jolly Farmer, and would extend over the whole of the Frimley district, but he would not proceed with it if the Council would oppose his application for the order. The Council will meet Mr. Lucas again in committee.

Canterbury.—The Council has adopted the recommendation of the Lighting Committee that the sum mentioned by the contractors for connecting up to consumers' houses for 30s. per house be accepted, and that the charges for current be as follows:—Private lighting, 6d. per unit; power and heat, &c., 3d. per unit.

Chelsea.—The Chelsea Electricity Supply Company, Limited, announce that they have reduced their price for power and heating, supplied at 200 volts, to 3d. per unit.

Cheltenham.—At last week's Council meeting the Lighting Committee reported that the electrical engineer had submitted estimates of the costs of providing arc lamps for lighting the Gloucester Road from the High Street to the Lansdown Castle, and the Tewkesbury Road from the Gloucester Road to the High Street Railway Station. Three schemes were submitted, and he recommended the third, involving an expenditure of £3,855, viz., Gloucester Road, Tewkesbury Road, and Lansdown Road (from Lansdown Castle to Westal Green), 15 arcs on arches in Lansdown Road, 37 on side pillars in Gloucester Road and Tewkesbury Road, and one on a centre pillar at the Lansdown Castle. The estimate assumed that the arc lighting cables along Lansdown Road are laid at the same time as the private supply cables for this road. If these cables were not laid as described the extra cost would be about £80. The acceptance of this scheme would necessitate application for an additional loan of £875 beyond that last applied for and not yet granted. The Lighting Committee approved the report and advised the Council to authorise the electrical engineer to arrange to carry out scheme 3, and also recommended that the private lighting mains in Lansdown Road be laid at the same time as the main for street lighting, that the Local Government Board be asked to sanction an increase of the loan for which application to borrow is now pending by the sum of £875, and that the electrical engineer be authorised to order switch gear required for the arc lighting circuits in Manchester Street. After a brief discussion the Council approved of the various recommendations.

Clacton-on-Sea.—The Sea Wall Commissioners considered the question of lighting the front last week, and there was a feeling in favour of electric lighting.

Coventry.—Mr. G. W. Willcocks held a Local Government Board inquiry on Tuesday, with respect to the application of the Corporation to borrow £30,000 for the extension of their electric lighting system. The Town Clerk (Mr. L. Beard) said the electric light works were opened for public supply on January 1st, 1896, upon a comparatively small scale. An extension was soon necessary and the plant had been increased to 350 kilowatts, and the mains to 3¼ miles. The capital outlay was £33,000. The Electric Light Committee had adopted the recommendations of their consulting engineer (Mr. R. Hammond), for a large extension of mains, additions to plant, provision for street lighting, and a railway siding. The estimated cost was £33,000. After detailed evidence by Mr. Hammond, the inspector visited the works and the sub-stations.

Darlaston.—The Midland Electric Corporation for Power Distribution, Limited, has entered into a satisfactory agreement with the Council.

Douglas.—Prof. Fleming's report on the scheme of the Town Council for the lighting of Douglas has been received, and will shortly be issued. His estimate of the cost of the smaller scheme submitted, namely, the lighting of the Promenades, Victoria Street to Finch Road, and Duke, Strand, and Castle Streets, is £30,000. Calculations made on this estimate show that the cost of electricity compared with the present gas system would be £1,000 a year in excess at first. Prof. Fleming has also reported on an extended system.

Dover.—A lady has claimed compensation from the Dover Electricity Supply Company for injuries sustained through falling over an electric light box in High Street. The company has admitted its responsibility.

Ealing.—At the meeting of the Ealing District Council on the 2nd inst., the Electric Lighting Committee reported, says the *Middlesex County Times*, that the question of the conduct of the switchboard men had occupied its attention, and it recommended that Mr. Bush be discharged. Mr. Recano's resignation was received. The committee, with the exception of one member, declined an interview. Mr. Armriding said that that morning he had received an electrical paper, and in an article in it there were some very grave accusations against their chief engineer. As a member of the committee he had never once received any information of any complaint from these men, except that Mr. Jordan handed him a letter from Mr. Knight, and a letter from Mr. Bush. Had he known of these accusations he would certainly have supported Mr. Brampton's proposal that Mr. Recano should be heard. After some discussion, Mr. Taylor moved that a special committee should meet at the earliest possible moment. Mr. Brampton seconded, and said he should like it to be composed of the whole Council, as it was no good referring it back to the Electric Lighting Committee. The chairman: This particular subject has not come before them. Mr. Thayers moved as an amendment that the Electric Lighting Committee be the committee to take the subject into consideration. Mr. Armriding seconded. Mr. Cowley said he was rather inclined to vote with Mr. Taylor, though out of no disrespect to the Electric Lighting Committee. He thought it more satisfactory, considering the circumstances, and to avoid it being said afterwards that they wanted to carry out their own ruling. Mr. Norris said that he was afraid if the matter did not go to the Electric Lighting Committee, it might perhaps look like a little snub to them. The committee had perhaps been a little partisan, but he had every confidence in its justice and he felt sure it would give the other side a fair hearing. Mr. Jordan said that the evidence they had had before the Electric Lighting Committee was very serious, and it would lead to more serious consequences in the future. They had done their duty in taking the action they had done. The whole Council had sufficient confidence in Mr. Knight to make him the head man at the place, and it was the duty of an employer to place every confidence in his manager until he found him out. The amendment that the matter should go before the Electric Lighting Committee was then put and carried by six votes to three.

It is stated that the Electric Lighting Committee last week made an exhaustive inquiry regarding the allegations. On Tuesday last week the committee examined all the employés at the works, and on 10th inst. sat again for the purpose of formulating its report to the Council, which was to be presented this week.

Eastbourne.—The Town Council last week adopted minutes of the joint sub-committee, in which they reported that "they considered the reference from the Council as to authorising them, if they thought proper, to engage Mr. Wright, of Brighton, electrical engineer, in addition to or in substitution for Mr. Hawtayne. It was resolved that Mr. Hawtayne be engaged to report on the proposal that the Corporation should provide the necessary plant, &c., for generating electric light for the existing public lamps and public buildings, either separately or in conjunction with the refuse destructor, for a fee of 30 guineas, without binding the Corporation to engage him in the event of their deciding to undertake any of those works. Further, that the question of engaging Mr. Wright be postponed for the present, pending the receipt by the committee of Mr. Hawtayne's report."

Edmonton.—In connection with the proposed installation of electric light in the workhouse, Mr. Sydney J. Ross has written offering to act as consulting electrical engineer for the scheme submitted by him, which amounted to £2,500. The letter was referred to the Works Committee of the Guardians.

Erith.—The Erith District Council have engaged the services of an expert on the matter of electric lighting.

Flitwick.—Mr. Alfred Pearse, the well-known illustrator to London magazines, has entered into partnership with Mr. Snetzler, engineer. They have purchased a factory in London. One of Mr. Pearse's smaller schemes is to light up the little village of Flitwick, where Mr. Pearse has a country residence, with electric light by means of the river Flit. At the place where it is proposed to erect the motor, the river is 15 feet wide, and is capable of supplying 20 H.P.

Folkestone.—Last week Colonel Coke, R.E., held a Local Government Board inquiry in respect of an application made by the Town Council to borrow the sum of £1,200 for the purposes of electric light—namely, the purchase of standards. The town clerk explained the purposes for which the money was required. There were, he said, to be 40 standards along the Leas front. The Council had accepted a tender at the price of £15 14s. per standard for those on the Leas, and £14 for the streets, and in addition there would be an allowance for fixing and painting—£2 each.

Frimley.—At the last District Council meeting, Mr. Lucas attended and addressed the Council *re* electric lighting. He asked the Council whether they would support him when he applied for the provisional order, or whether they intended to carry out a scheme of electric lighting themselves. The outlay on the whole scheme would be something like £25,000 or £26,000. After consideration it was decided that Mr. Lucas, with his engineer, should meet the whole Council in committee and go through the scheme.

Garston.—At the last District Council meeting a letter was read from the Local Government Board, enclosing a copy of a letter sent to them by Messrs. Peacock, Gregory & Bousfield, solicitors, Liverpool, asking them not to sanction the application of the Garston District Council for power to borrow £24,000 for the purpose of erecting a refuse destructor and electric lighting station at Grassendale; also petition signed by 542 owners objecting to the refuse destructor and electric light generating station being fixed there. The central authority asked for the opinion of the Council on these matters. After some discussion the Special Purposes Committee was instructed to prepare a reply.

Germany.—Messrs. Siemens & Halske, Berlin, have just secured a contract for the establishment of a central electric lighting station at Ahlfeld-am-Leine at a cost of £65,000.

Glasgow.—The Watching and Lighting Committee advises that in the event of the Corporation deciding to erect trolley poles for the High Street tramways, from Glasgow Cross to Parliamentary Road, such poles should be used for lighting purposes. 37 lights would be required, the annual cost of the electric current, at the present rate, being £666. Gas lighting costs £191 at present.

The Dean of Guild Court last week granted the Glasgow Corporation permission to erect a new generating and electric storage station in Corn Street and Sawmillfield Street.

Godalming.—The authorities at Whitehall have refused to sanction the raising of a loan for the purpose of electric lighting at Godalming, in consequence of the strong opposition laid before the inspector who inquired into the matter.

Hackney.—We learn that the Vestry has referred Mr. F. H. Medhurst's action to a Special Committee, consisting of the Chairman of the Vestry, and the Chairmen of the several Standing Committees, the said Special Committee to have power, in the name of the Vestry, to engage counsel, incur expenditure, and to take all steps that may be deemed expedient to defend the interests of the Vestry in respect of such action. The Vestry last week decided by a good majority not to hand the provisional order over to a company.

Hanley.—The North Staffordshire Traders' Association is agitating for a reduction in the charges for current.

Hampstead.—The Vestry has decided to extend the public lighting by arc lamps from a point near the Hampstead Fire Station along Heath Street to a point close to the summit of the Heath.

The Vestry is to be asked to consider the advisability of lighting West End Lane, Mill Lane, Fortune Green Road, and Fortune Green by electricity.

Huddersfield.—At Wednesday's meeting of the County Borough Council, the electrical engineer reported the number of consumers of electric light for the month to be 685, an increase for the month of 24. The lamps connected—46,014—showed an increase of 1,257, and the units metered in May, 28,460, or an increase on the corresponding period of the previous year of 9,779, equal to 52 per cent. The tender of Mr. James Proctor, of Burnley, for the sum of £69 per boiler, delivered and fixed, for mechanical stokers for the four new boilers at the electric supply station, was accepted. The tender of Messrs. Read, Holliday & Sons has been accepted for the electric fittings for the new police station at Huddersfield.

Ilkeston.—The Town Clerk has reported to the District Council *re* the Dover electric trams, and in consequence the Council will hold a special meeting on July 12th to pass a statutory resolution applying for a provisional order under the Tramways Act. At the same meeting a resolution will be brought forward applying for a provisional electric lighting order. The scheme of the General Power Distributing Company is to be opposed.

Ipswich.—After again going into the question of electric lighting for the workhouse, the Workhouse Committee advised that a gas engine be supplied by the gas company for £400, and that Messrs. Crompton & Co.'s tender for the other plant, &c., for the installation be accepted at £1,650. The Board of Guardians, however, rejected the proposal on an amendment, and the matter has been referred back to the committee to get estimates for gas lighting.

Islington.—The Progressives on the Vestry last week ousted Mr. Lambert from the position of Chairman of the Electric Lighting Committee, and appointed Mr. Gordon in his place. We have already briefly referred to this matter.

King's Norton.—The Board of Trade have issued copies of the new provisional order which they have just issued to the Council.

Leigh.—The District Council having obtained an Electric Lighting Order, are proposing to borrow £10,500 to spend on electric works. The estimate of the gas manager, Mr. J. Foster, is that £10,000 will be required for the buildings and plants. The proposed buildings include an engine and accumulator house, concrete foundations for two engines and dynamos, which will cost £1,250; £250 is allowed for the woodwork, and £180 for an eight-ton overhead travelling crane. Under the head of engines, dynamos, &c, £1,150 is allowed for one 80-kilowatt coupled engine and dynamo; £1,300 for the other engine (40-kilowatt dynamo), while the switchboard will cost £700; and the accumlators £1,550. The cost of the main feeders and distributors, including 2,180 yards of triple concentric lead covered distributing main in Queen Street, Bradshawgate, Church Street, King Street, Railway Road, and Market Street, would be £2,885 2s. 6d, £1,100 of this being absorbed under the head of "100 house connections, including service cable meter, cut-out, &c., and fixing at £11. Electric tramways have also been under discussion.

Leith.—By six votes to five, the Council has agreed to authorise the electrical engineer (Mr. Bryson) to advise parties as to the wiring of their premises, with a view to their taking in the Corporation electric light supply; but on condition that the fees received by him be put into a fee fund in the Council's hands, out of which the Council might, at any time they think fit, allow Mr. Bryson any extra remuneration.

Lewisham.—Last week the Blackheath and Greenwich District Electric Light Company wrote to this Vestry that they were concluding negotiations for the purchase of a site for their electricity station at Blackwall point, which would be conveniently situated for the erection of a dust destructor. The company offered to enter into negotiations with the board with a view to the erection of such works for destroying the refuse of the district. A committee will consider the point.

Leyton.—The District Council have resolved to apply for an additional £5,000 for electric lighting, in consequence of increased demand for current. It is proposed to at once erect a new battery station. The electrical engineer has obtained quotations for batteries and accessories from various manufacturers, and an order has been given out, as stated in our "Contracts Closed" this week. Arc lamps are to be placed, by way of experiment, in High Road, Leytonstone.

London.—The St. James's Vestry is requesting the Electric Ligting Company which supplies the district, to reduce the charges for current. The company is understood to have replied, stating that it had done its best for the district, and suggesting that the matter be referred to arbitration.

At last week's Court of Common Council, Mr. Brooke-Hitching's resolution referring the question of the purchase of the undertaking of the City of London Electric Light Company to the Streets Committee for consideration was adjourned. When the Council passed the company's account for £209 odd for one quarter's current for the City Lands Committee, Mr. Norton said that the company's action in reducing the charge from 7d. to 6d. per unit was due to the Court's action in protesting against the high charges.

Luton.—A committee of the Town Council has been considering the electric lighting question, and on 7th inst. its report was submitted to the Council. The committee visited various electricity works in the country and gathered particulars, and had also considered a communication from the Municipal Electric Supply Company. The company laid before the committee the terms upon which they would take over the municipal provisional order, and after detailing various conditions, concluded by saying that the "company is not connected with makers of engines, boilers, dynamos, mains, &c., and is thus quite free from any trade bias in favour of particular machinery." The company is also stated to have expressed a desire to establish a tramway system to Dunstable and Houghton Regis, and the town and suburbs generally. The committee advised the Council to ask Mr. Albion T. Snell whether he would be prepared to meet the committee to confer upon the question, and to carry out the installation proposed for the town. After a long discussion, the proposal was adopted by 14 votes to 1, and a further resolution was passed to the effect that the committee has no further communication with any company.

Macroom.—The Commissioners can get no reply from the contractor (Mr. Thierman, Manchester) for electric lighting of the town. The Town Clerk is to write again requesting a reply, and in the meantime to advertise for a new contractor.

Manchester.—At last week's City Council meeting Alderman Higginbottom (chairman of the Electricity Committee) reminded the Council that the joint report on the subject of electrical supply had just been issued, and that it had gone against municipal authorities. The principle laid down therein did away with what they always considered they had in Corporations, namely, the monopoly and the right over their streets. It would enable any private incorporated electric company to place a generating station outside any city or town, and give notice to the authority inside that the mains were to be laid. That authority would have to do the work and would be paid for doing it. Now this was a position they in Manchester very strongly objected to. The principle affected some four or five Bills at present before Parliament, in one of which Manchester was interested. Lord Morley and Sir Courtenay Boyle had laid down the principle that a tramway company could go to Parliament for a provisional order to equip its lines and work them with electricity; and, having obtained that, it could go to the Board of Trade and ask for a provisional order to supply consumers with the electric light along the whole route, thus entering into competition with the authority. The joint report lay upon the table in Parliament, and it would have to lie there for a certain time. No discussion whatever would take place upon it, which seemed to him to be a very curious thing. It naturally followed, however, that if the principles he had referred to were to be placed in all provisional orders and all other Bills relating to electrical energy in any form, there must be legislation. That being so, the measure would have to be fought step by step in the interests of the Corporation. Upon their supposed monopoly they had borrowed money and laid down plant, and now that monopoly was threatened. It was a state of things which they could not look forward to with any degree of composure, and he hoped the Council would entrust the committee with the necessary authority to protect the interests of the Corporation.

Monmouth.—At last week's Council meeting the report of the Drainage and Electric Light Committee was discussed at great length. The £20,000 borrowed for the carrying out of the combined scheme of drainage and electric light appeared to have been already practically expended while the work was not nearly completed. Mr. Breakwell, chairman of the committee in charge of the scheme, explained that their engineer, Mr. Lailey, had not yet rendered his report. They were therefore unable to give the figures. They were also at a deadlock for money, as the Local Government Board would not sanction the additional loan of £10,000 until they got Mr. Lailey's report explanatory of the extraordinary difference between his original estimate and the actual cost of the work. It was resolved to write to Mr. Lailey again on the subject.

Newcastle.—The Committee which is considering the question of purchase of the electric lighting undertakings met on Monday, but nothing particular was decided, as it is proposed to await the action of the Tramways Committee before drawing up a recommendation.

A main box cover was blown off by an explosion on 7th inst. No one was hurt.

Newport.—A report to the Electricity Committee shows that the number of lights now connected and on order is equivalent to 18,538 of 8 C.P. It has been decided to adopt the electric light for the new Union Workhouse and offices, the estimated number of lights required being 550. The borough electrical engineer submitted his report upon the condition of the plant, which is all in satisfactory working order. A comparison of the capacity of the plant, with the number of lights connected, shows it to be overloaded to a slight extent at the lighest load even at the present time. With reference to the question of obtaining an emergency plant to cope with the demand during the coming winter, pending the delivery of the new plant, the consulting engineer, who attended, reported that he had made a number of inquiries and obtained several offers, which he had considered in conjunction with the chairman. The one they considered most suitable was that of the Sheffield Electric Light and Power Company, Limited, a marine type Brush engine, driving a 100 kw. Mordey alternator by ropes. The engine was in excellent order, but the alternator required re-winding, and the Brush Company proposed to make practically a new machine of it for the sum of £371 17s. 6d., and to deliver in 16 weeks. The company would remove the plant from Sheffield and erect it at Newport for £182. It is recommended that the plant be placed at the far end of the extended engine house, just beyond the foundation for the second 300 kw. set. The total cost is estimated as follows:—

	£	s.	d.
Plant, as it stands at Sheffield	400	0	0
New field magnets and armature coils	371	17	6
Dismantling, carriage, and re-erection	182	0	0
Foundations	60	0	0
Steam and exhaust pipes	20	0	0
Switch gear	0	0	0
Fees and contingencies	116	2	6
	£1,150	0	0

It was assumed that connection would be made to the new steam range at its extreme end, and the switch gear for No. 7 alternator will be available. The matter having been considered, the Council resolved that the plant be purchased and erected. Application is to be at once made as to a loan in respect of this plant and the extension of the low tension distribution system in Commercial Road decided upon at the last meeting. A letter from the Board of Trade approving the additional system for supply of electrical energy and describing their requirements for the construction of transformers, was reported to have been received. The mains are to be extended along Risca Road.

Nottingham.—The Corporation is negotiating for the purchase of property lying between the present works and Hanley Street, for the purpose of extending the electric lighting station, upon whose supplies there is a greatly increased demand.

Poplar.—The Board of Works have asked the Guardians to suspend their own electric lighting of the workhouse pending the supply of the parochial current.

Provisional Orders.—There are at the moment quite a number of Bills before Parliament to confirm provisional orders made by the Board of Trade under the Electric Lighting Acts, and, remarks a daily paper, amongst those of interest to London are orders in regard to Holborn and St. Giles, Bermondsey, and St. Marylebone. As regards Holborn and St. Giles, the undertakers under this order are the County of London and Brush Electric Lighting Company, Limited, and the area of supply is portions of the districts of the Board of Works for the Holborn and St. Giles Districts; while under the other the undertakers are the Charing Cross and Strand Electricity Supply Corporation, Limited, and the area of supply is portions of the districts of the Board of Works for the Holborn and St. Giles Districts. The Bermondsey and Marylebone undertakers are the respective Vestries.

The Middlesbrough and Darlington Electric Lighting Bills were on 10th inst. sent for second reading in the House of Lords.

Rotherhithe.—The Vestry agrees to take a supply of current from the London Electric Supply Corporation at the usual terms, for lighting the Town Hall as soon as the mains are laid there.

Sale.—At the last meeting of the District Council, it was stated that the Manchester Corporation could make arrangements for supplying the electric light to Sale either by way of Stretford or Chorlton-cum-Hardy, and that the price would not exceed 3d. per unit. One speaker was not satisfied with the report on the electric lighting of the township as drafted by Mr. Shaw, and he moved that Prof. Kennedy should be asked to prepare a report and submit a scheme with and without street lighting. The motion had no seconder.

Salford.—The Electric Light Committee has instructed the engineer to proceed with the laying of the cable along Bolton Road. The engineer reported that it was advisable that the committee and the Electric Light Committee of the Manchester Corporation should meet together for the purpose of arranging standard pressure for the working of the tram service, so that the cars might run smoothly on the Salford and Manchester lines. A communication was directed to be made to the Manchester Electric Light Committee, asking them to receive a deputation from this committee upon the subject. A tender from Messrs. W. T. Glover & Co. for the supply of one mile of low tension single cable, lead covered, for the sum of £115, was accepted.

Sheerness.—The first installation of electric light in Sheerness has just been completed, the proprietor of the Bell and Lion Hotel having adopted this method of lighting throughout his premises. He is also supplying a neighbour with the light.

Sheffield.—The Sheffield Chamber of Commerce has passed a resolution in regard to the scheme of the General Power Distributing Company to the effect that it favours the establishment of a competitive supply of electrical energy for Sheffield.

Shrewsbury.—At last Monday's meeting of the Shrewsbury Town Council, the question of purchasing the Shropshire Electric Light Works was carried another stage. The matter has been under consideration for some time. The proposal was vigorously attacked at the last annual meeting of the Shrewsbury Gas Company, both on financial grounds and those of the effectiveness of the illuminant, but the Council were not persuaded from the attempt to buy the undertaking, and negotiations resulted in its being decided on Monday to instruct the Town Clerk to make application to the Local Government Board for sanction to a loan of £35,000 "to complete the purchase of the Shropshire Electric Light and Power Company, and also a sum of £800 for adjoining buildings." It was stated in the discussion that on the Council's getting the works, they will at once proceed to light the town with electricity.

Southport.—The electrical engineer (Mr. C. D. Taite) has just issued his second annual report, showing that during the year the net profit of £643 has been made, as against a loss of £471 in the previous year.

Stanford-le-Hope.—A parish meeting has been discussing the lighting question. Gas and oil systems were considered, and then Mr. Simpson said the firm he represented were prepared to form a local company for the supply of electric light, with a capital of £2,000, of which they were prepared to find one-half if the other were subscribed locally. The price per unit for street lighting would be 4½d., and about 7d. per unit for private use. That capital would be sufficient for 500 lamps of 16 C.P. They would require about 50 for street lighting, which would work out at about £2 12s. per lamp.

Stockton.—Mr. H. P. Boulnois, C.E., held a Local Government Board inquiry last week into the application of the Corporation to borrow money for electric lighting. Borrowing powers to the extent of £30,000 are asked for, and it is proposed to spend £22,000 of this sum at present.

St. Pancras.—At the Vestry meeting on Wednesday last week, the Electricity and Public Lighting Committee reported that they had elected Dr. Walter Smith as chairman for the ensuing year. There were 47 candidates for the position of inspector of works, rendered vacant by the resignation of Mr. J. C. A. Ward, and Mr. F. Alan Wilkinson, superintendent of mains at Bournemouth, has been appointed.

Tunbridge Wells.—On Friday the Tunbridge Wells Improvement Association passed a resolution in favour of the consumer being given a share of the profit made on the Corporation electric light undertaking, by reducing the charge, instead of devoting all the profit to the reduction of the rates.

Twickenham and Teddington.—A proposal is on foot to form a company with the object of supplying electricity to Twickenham and Teddington. A communication made by the company was under consideration by the Twickenham District Council last week, and it was decided to consult the members of the Teddington Council.

Wells.—The Board of Trade has informed the Council that it has no power to extend the time of the provisional order for electric lighting.

Westgate-on-Sea.—The Board of Trade have informed the Isle of Thanet Rural District Council that, after consideration of the report made to them by the inspector appointed to inquire into the matter of the Westgate-on-Sea electric lighting provisional order, they do not propose to proceed with the application.

West Hartlepool.—The Council is to obtain estimates for a dust destructor, which may be used in connection with electric lighting.

Weston-super-Mare.—The Weston and District Electric Light and Power Syndicate has intimated its intention to apply to the Board of Trade to annul the Council's provisional order, and to grant the company a similar order.

Woking.—The Woking Electric Supply Company has agreed to the deductions made from their account for failures. The company is endeavouring to meet the Council's wishes by close attention to the efficiency and upkeep of the street lights.—The District Council last week had a discussion with regard to the dense volumes of smoke which have lately been issuing from the Electric Light Company's works. Mr. Cox thought that indulgence should be granted to the company in order to allow them time to alter their furnaces in such a way as would prevent this nuisance in the future. The company is to be written to on the matter.

Wolverhampton.—At the monthly Council meeting on Monday, the Lighting Committee submitted the electric lighting accounts for the year ended March 31st. The accounts show that a profit of £589 14s. 4d. has been made, after payment of interest and sinking fund. This has been applied to the deficiency on the working of the previous year, reducing the sum to £588 0s. 6d. A few of the figures from the accounts may be interesting. The capital account shows that the amount of loans sanctioned is £47,799 (at 2½ and 3 per cent., and for 25 and 30 years), and that £32,660 was borrowed up to March 31st. A sum of £345 has been repaid. The total capital expenditure up to March 31st was £41,781. The revenue account for the year shows income amounting to £6,257 (including £4,687 by sale at 6d. per unit, and £302 at 3d., £1,275 by sale of current for public lamps, &c.). The expenditure reaches to £3,423, including £2,211 for generator, £247 for repairs to public lamps, £703 management expenses, &c. The credit balance was £2,833. This is set against the capital charges for the year, leaving a net profit of £589 14s. 4d., as above stated. This latter sum is in turn set against the debit balance of £1,177 at March 31st, 1897, reducing it to £588 0s. 6d. The statement of output shows that 370,084 Board of Trade units of current were generated during the year. Of these 291,233 were sold, and 3,931 were used at the works, leaving 74,925 units as waste or leakage. The maximum demand which the works are under covenant to meet is equal to 14,151 32-watt lamps. The committee make the following recommendations:—(1) That from July 1st the price of energy for motor power and heating purposes be fixed at 2d. per unit on a maximum demand for an average of two hours per day, and 1d. per unit for all energy consumed in excess thereof. (2) That application be made to the Local Government Board for a loan to cover capital expenditure in purchasing and hiring out motors to motor power consumers, both on the simple hire and the hire-purchase system, and in the wiring and fitting up by consumers of the premises for electric lighting purposes. (3) That your Committee be empowered to make such terms as they shall deem advisable for the hire of motors and for the repayment of the capital expenditure incurred on behalf of consumers in wiring and fitting up their premises. The above recommendations were agreed to at the meeting of the Council. Alderman Mander said that in 1897 they sold 224,709 units, which was an increase of 14 per cent. on the previous year. But this year they had sold 291,233 units, or an increase of 22 per cent. The number of lamps was in 1896, 8,941; in 1897, 11,307, an increase of 21 per cent; and in 1898, 14,151, an increase of 20 per cent. Their gross profit this year was £2,833 14s. 9d., or 6½ per cent., the net profit being 1 per cent. The Council is to spend £200 upon fitting up the Free Library for electric lighting.

Wolverhampton.—The report of the Lighting Committee was issued to the members of the Council last week. The Committee report that the operations of the year have again been successful. A profit of £589 14s. 4d. has been made after payment of interest and sinking fund. This has been applied to the deficiency on the working of the previous years, reducing the same to £588 0s. 6d.

Worcester.—Last week the Council concurred in an agreement transferring to the National Electric Free Wiring Company, Limited, the rights and obligations of the Electric Free Wiring Syndicate under their agreement with the Council. There was a brief discussion *re* the Brush Company's bill for £365 for additional work and goods supplied, but the bill was passed for payment.

Worthing.—At a meeting of the Council in committee held on May 12th, Alderman Linfield, as chairman of the Electric Lighting Committee, submitted the report of Messrs. Burstall and Monkhouse, electrical engineers, upon the three schemes received by the Committee for the proposed electric lighting of the borough from Messrs. Siemens & Co., Edmundson's Electricity Corporation, Limited, and the Municipal Electric Supply Company. It was resolved "That it is expedient to undertake the construction of electric lighting works on the same or similar terms to those contained in the proposal of Messrs. Siemens and Co., keeping the same in their own hands, and requiring the contractors to work the undertaking at a stipulated rental for five or seven years.

ELECTRIC TRACTION AND MOTIVE POWER NOTES.

Birmingham.—Sir James Smith's name having been mentioned in connection with a letter which was stated to have reached the Birmingham Tramways Company, in which permission had been given to proceed with the overhead wire system, Sir James Smith made a personal explanation at Tuesday's meeting of the City Council, from which it appeared that he had given no authority for any such letter to be sent. It seems that Sir James had a conversation on the matter with a certain gentleman, who wrote to Mr. Ross of the Tramways Company, and quoted a remark made by him. Sir James's explanation was considered perfectly satisfactory.

Brierley Hill.—The District Council had various matters regarding the electric tramway scheme before it last week. It approved of the creosote wood blocks proposed by the British Electric Traction Company for paving, it acceded to the company's application for permission to lay underground electric cables, gave the surveyor instructions that not more than 100 yards of the road should be broken up at one time, resolved not to oppose the application of the Dudley and Stourbridge Electric Traction Company for a renewal of the steam power license for a year (this is merely a formality that must be gone through, as already explained), and has resolved to support the company's application to the Board of Trade for confirmation of the order granted to them by the Light Railway Commissioners for making a light railway for the Cradley Heath district. This application, it should be mentioned, is opposed by the Dudley Corporation. The Stourbridge District Council has also decided to support the company's proposals, and will send representatives to the forthcoming inquiry with that object. The Brierley Hill Council will do likewise.

Bristol.—The Bristol Tramways (Electrical Power, &c.) Bill and the Bristol Tramways (Extensions) Bill were on Tuesday ordered for third reading in the House of Commons.

Cape Town.—The *Westminster Gazette* remarks that the electric car can be made to pay, and pay well; and this seems evident from some figures relating to the Cape Electric Tramways, Limited. For the past six months the revenue has amounted to £66,934, and the expenditure to £29,902, leaving a profit of £37,032, or at the rate of £74,064 a year, which is a handsome return on the capital. The 6 per cent. interest on the £315,000 first debentures, and the 5 per cent. interest on the £115,000 second debentures would absorb £24,650, so that even after paying a 10 per cent. dividend on the £400,000 ordinary shares a balance of nearly £10,000 would be left for reserve fund and other purposes. Of this company, Sir Charles Euan-Smith, K.C.B., is chairman, and amongst the directors are Vice-Admiral A. H. Markham, Mr. John Hays Hammond, Dr. Rutherfoord Harris, and Mr. Alfred Parrish.

Clontarf and Hill of Howth.—A special meeting of the proprietors of the Dublin United Tramways Company was held last week at the office, Upper O'Connell Street, Dublin, for the purpose of considering and approving, or otherwise, of the Bill applied for by the Clontarf and Hill of Howth Tramroad Company in the present session of Parliament. A resolution was adopted approving of the measure, subject to such conditions, alterations, and variations, as Parliament may think fit to make in it. The Bill passed second reading on Tuesday.

Dover.—At last week's meeting of the Finance Committee in connection with the bill from the Dover Electricity Company for £500 for the supply of current to the trams during the last quarter, Alderman Peake said he saw that the Corporation had taken all the power they guaranteed, within £56 worth. The Town Clerk replied that that was so, and when the two new cars arrive—probably this month—the whole of the current will be taken.—Councillor Edwin said he saw the amount charged in the company's bill was £56 19s.

for unused current. Would they get credit for this sum if they used over the guaranteed amount during the year?—The Town Clerk: Yes, an average is struck.

Dublin.—Major Cardew made a Board of Trade inspection on 7th inst. of the new electric line between Haddington Road and Nelson's Pillar. He was accompanied by Mr. Anderson, J.P., secretary and manager of the company; Mr. Astrow, engineer in charge of the new electric service; and Mr. Towle, electrical engineer. A journey was made from Haddington Road to the Pillar, and the line and rolling stock were found to be in good order. Some of the underground work still remains to be completed, so that the new service will not be open for traffic for a few days yet.

The Corporation will not allow electric tramways to be run through Phœnix Park.

Glasgow.—The question of the electrolysis of the gas and water mains, as the result of the working of the Springburn tramway route by electric energy, having been recently raised, the subject was remitted to a joint sub-committee of the Gas and Water Committees for consideration. The sub-committee referred the question to Mr. Chamen, the electrical engineer to the Corporation, who has just presented an elaborate report, in which, says the *Glasgow Herald*, he discusses the subject in all its bearings. Having considered this report and received further verbal explanations, the joint sub-committee have resolved to report (1) that if the Tramway Department observe and carry out the rules and regulations of the Board of Trade with respect to the construction and maintenance of the electric tramways, there does not appear to be any danger of the gas and water mains along the route being injuriously affected by electrolysis from the action of the return current along the tramway rails or otherwise; and (2) that the electrical engineer should report to the engineers of the Gas and Water Departments respectively any further facts or circumstances which may from time to time hereafter come to his knowledge in regard to any of the matters dealt with in his report.

Great Northern and City Railway.—The secretary of the new company informs a financial paper that the size of the electrical locomotive required to haul the Great Northern Railway Company's suburban trains, consisting of 11 coaches, and seating 500 passengers, from Finsbury Park to Moorgate Street station, will be very moderate, compared with some of those in successful use in the United States, where trains of five times the weight are satisfactorily hauled by electric locomotives.

Hastings and Bexhill.—Last week an inquiry was held at Hastings by the Light Railways Commissioners regarding the scheme of the Hastings, Bexhill, and District Light Railways Company. The inquiry came to an abrupt termination, the chairman stating that the Commissioners considered that as there was a feeling of great opposition to tramways, although the majority of the Council was in favour of the project, they did not think it desirable to try and force upon the town a scheme which was not generally acceptable.

Huddersfield.—The Council has resolved that the new tramway rails at present being manufactured for the Corporation, be ordered to be drilled so as to be applicable for electric traction.

Hull.—Laying the first rail of the electric tramways was made the occasion of a public ceremony on the 9th inst., the Mayor and Corporation being present. There were speeches by local dignitaries, and in the evening Alderman Larard, chairman of the Works Committee, entertained his colleagues on the committee with their wives and a number of friends, to dinner at the Town Hall.

King's Norton.—The Clerk to the District Council has been instructed to write to the Town Clerk of Birmingham, pointing out that that body is opposed to overhead electric tramways, and expressing the hope that the Corporation would not sanction experiments upon any of the tramways within the city which had their terminus in the district of the Council.

Kirkcaldy.—On Monday night the Town Council had before them Prof. Kennedy's report as to the proposed introduction of the electric lighting and trams. The report shows the proposed route of the tramway to be 6½ miles, with circular routes from West Bridge by the Public Park, Victoria Road, to Pathhead, and thence to Gallatown; also along Links Street, High Street, and Sands Road. A branch line will be made to provide for station traffic by placing a line up Whyte's Causeway and Wemyssfield to join the upper routes. The Provost intimated that a private company which had the matter in hand was desirous of allowing the Council to take up the scheme, failing which they would take up the matter and float the scheme. The cost, he considered, would be nothing less than £100,000. In view of the limited time at the disposal of the promoters to enable them to apply for a Bill, it was agreed to hold a special meeting to consider the whole matter, and give a final decision in July.

The London United Tramways Bill.—This Bill came before a Select Committee of the House of Commons on Thursday last week. Mr. Little, Q.C., who appeard for the promoters, explained the objects of the measure. It contemplates, says the *Times* report, the construction of a series of new tramways, one from Acton to Hanwell, over two miles in length along the Uxbridge Road, another from Hanwell to Brentford, one mile one furlong in length along the Boston Road, and another from Kew Bridge to Hounslow, two miles four furlongs in length. It is proposed to carry a line over Kew Bridge when the contemplated new structure is completed. The new lines will pass through the districts of Acton, Ealing, Hanwell, Brentford, and Heston and Isleworth. They are to be worked by electricity, on the overhead trolley system. The learned counsel pointed out that another object of the Bill was to enable the promoters to work their existing lines from the Uxbridge Road station to the boundary of Acton and from the same place to Kew Bridge, and from Hammersmith Broadway, by loop, to a place on the last-named line, by electricity. The districts through which the new lines would run were well populated, and the service of omnibuses was not efficient. He further pointed out that the chief opponents of the Bill were the Ealing local authorities and the London County Council. The Middlesex County Council also petitioned against the Bill. Inside London the London County Council and the Hammersmith Vestry seemed both to be in a condition of absolute darkness as to the existence of overhead wires elsewhere, and they opposed the Bill. The proposal originally made by the company to use mechanical power on their line to Richmond had been withdrawn for the present. The Hammersmith Vestry, after being consulted by the company, had sent a deputation to Havre to see the working of the overhead system there and had unanimously approved the adoption of the system, but it had since altered its mind and decided to oppose the Bill. The Ealing District Council had agreed by a majority of one only to oppose the Bill.

The first witness called on behalf of the promoters was Mr. Clifton Robinson, managing director and engineer of the London United Tramways Company. In examination by Mr. Balfour Browne, Q.C., he said that 8½ millions of passengers were carried over the existing lines last year. He had had considerable experience of other tramways, and that experience taught him that the introduction of electric traction doubled the volume of traffic. He estimated that if such traction were introduced and the proposed extensions were made to Hounslow and Hanwell the company would carry 25,000,000 of passengers every year. His experience further showed that, with the advent of electricity, the best results would be obtained by the reduction of fares by at least one-half. The fares charged on workmen's cars would be half the ordinary fares. As far as he knew there had never been an accident owing to the use of overhead tramway wires.

In cross-examination by Mr. Pope, Q.C. (on behalf of the London County Council), witness said that the County Council had at present the right to approve or negative the use of electric traction within the county of London. The company had sent three deputations to the County Council, one of them being supported by the Hammersmith Vestry. Having been unable to overcome the County Council's ill-advised obstruction to a popular mode of traction, the company had resolved to appeal to Parliament. It was the case that the company proposed to substitute the Board of Trade as the controlling authority in connection with these matters for the London County Council. The County Council had the right to purchase the company's undertaking in 11 years' time.

Sir J. Brunner asked whether any tramway in London was worked by electric traction at present.

Mr. Pope replied that there were none.

Sir J. Brunner asked whether the County Council had opposed all applications for power to use electric traction.

Mr. Pope said they had not. They were not opposed to electric traction, but, generally speaking, they were opposed to overhead wires.

Replying to Colonel Welby, witness stated that the average life of a horse employed on a tramway did not exceed five years, no matter how well it was selected or how well it was taken care of.

In answer to further questions witness strenuously denied that an electric tramcar made as much noise as an ordinary motor-car, and said that an electric tramcar glided along like a boat on ice. He expressed the opinion that electric traction had now reached such a point that there could be no opposition to it that was not factious.

The committee resumed its investigation on Friday. Evidence in support of the Bill was given by gentlemen who had had experience of such tramways in Dublin, Dover, and Wednesbury, and the committee adjourned.

The committee had the Bill before it again on Tuesday. The question of the opposition was discussed between counsel and the committee.

Wednesday's proceedings before the committee consisted of evidence from residents in favour of the scheme, and technical evidence by Mr. Alex. Siemens and Dr. John Hopkinson in favour of the overhead trolley. Dr. Hopkinson said that so far as there was any force in the objection of the London County Council to the Bill, he thought the objection might be met by proposing to the tramway company that they should agree with the County Council that, in the event of the latter body constructing a conduit electric tramway in continuation of the company's tramway, they would themselves introduce the conduit system as far as the county boundary.—Mr. L. Coward (for the company) said his clients would be prepared to enter into such an agreement.—Mr. J. Swinburne also gave evidence.

Manchester.—At a meeting of the Electricity Committee of the Manchester Corporation held on Tuesday, a deputation attended from the Salford Corporation for the purpose of conferring on the subject of the proposed electrical traction for tramcars. Manchester has decided that when electricity forms the motive power on the tramways the pressure shall be 400 volts, which will suffice for both lighting and traction purposes. It is desirable that the pressure shall be the same in Salford as in Manchester, and the Salford Corporation will now doubtless make arrangements for supplying a pressure similar to that which will be given in Manchester.

Middlesbrough.—Last week several trips were made over the entire length of the electric tramway from here to Stockton, partly for the education of drivers and conductors. The opening day is not yet fixed. The Government inspection will have to be held first.

Merthyr Tydfil.—The Roads and Bridges Committee of the Glamorgan County Council has decided to recommend the Council to take steps to oppose the scheme being promoted in the Merthyr Tydfil Light Railway Order for the construction of electric railways, and to intimate to the Local District Council that in the event of the scheme being carried out the Council would discontinue its contributions to the maintenance of the roads in the district. The principal of these lines would run for part of its length along a road contributed to by the County Council, a great deal of which was of insufficient width to admit of a railway or tramway with safety to the public.

Morecambe.—It is proposed to erect a novel tower for the east end of the town. The tower will be illuminated by electric lights and an electric car will run underneath the spiral roadway. At the apex of the tower will be a search light of great power showing its light for 20 miles. There will be a special electric lighting plant put down for supplying the requirements of the tower.

Norwich.—The Norwich Electric Tramways Bill was read a third time on Tuesday.

Rochester.—A committee of the Corporation has received a deputation consisting of Mr. Henry Jasper and Mr. Atherton (promoters), Messrs. Giepel and Walters (engineers), and Mr. A. R. Norman (solicitor), *re* a scheme for the construction of a light railway partly within the city. Plans, sections and other particulars are in the Town Clerk's possession.

Ryde.—The Ryde Pier Company are stated in a daily paper to be making preparations for the season by improving their electric railway, and placing it on a stronger and better foundation.

Southborough. — The Southborough tradesmen are opposed to the proposed electrical tramway from Tunbridge Wells to Southborough on the ground that it will induce customers to shop at Tunbridge Wells.

St. Helens.—At the last meeting of the Borough Council the Mayor moved the confirmation of the minutes of the Electric Lighting and Traction Committee, in which were set out the arrangements come to in regard to equipping the tram lines and supplying electrical current for the new electrical tramcars The St. Helens Tramway Company will continue to run the trams and provide rolling stock, and the Corporation have undertaken to supply electricity from the depôt in Boundary Road at the following rates:—2d. per unit on a guaranteed consumption of 200 000 units per annum; 1¾d. per unit for 400,000 units; 1½d. per unit for 600,000 units; and 1d. per unit if the tramways are extended in such a manner as to require 800,000 units per annum. The fixed rent per annum at present paid by the company will be increased to £2,700 when the Prescot and Denton's Green sections are ready for work, and to £3,000 per annum when the whole of the present lines are worked by electricity. This arrangement as to rent is to continue for seven years.—After several questions had been put by Councillor Burchall, the minutes were approved.—The Mayor remarked that they hoped to have the work of converting the tramways from steam to electricity done quicker than was at first anticipated.

TELEGRAPH AND TELEPHONE NOTES.

The "Brazilian" and "Western and Brazilian."—*Money* understands that the agreement between these two telegraph companies will be issued in about a week, and that by its terms the Western and Brazilian deferred shares will be found to be worth about £6 each.

Chatham Telephones.—The Corporation has given the National Telephone Company consent, on certain conditions, to change their service over to the twin wire system.

China Cables.—"Secohm," writing to the *Westminster Gazette*, says that it is important to know at what point the projected cable to Wei-hai-Wei is to be connected to the existing cable systems. "If at Shanghai, as is probable, do not let us forget that the cable office there is a Russo-English one; the Russian interest, according to your Danish interviewee, having taken the place of the previous Danish property."

The Telegraph Wire Export Trade.—The month of May has proved to be a very quiet one as regards the exports from this country of telegraph wire and parts connected therewith, the value for the month having only amounted to £41,944 as compared with £64,883 in the preceding month, £61,226 in May last year, and £112,215 in May, 1896. For the five months ending with May the exports have attained a value of £355,615, as against £382,386 in the corresponding period of last year, and £323,583 in the first five months of 1896.

Telegraphic Isolation of the Cape.—From the daily press we learn that the cable which runs between Mozambique and Delagoa Bay, on the East Coast of Africa, broke down on the evening of the 13th, since which time there has been no means of cable communication with the Cape and the Transvaal, as the cables along the West Coast of Africa have not been available since June 3rd, on which date the cable between Loanda and St. Thomé was interrupted. The following is a list of interruptions to the cables to the Cape during the last 15 months, from which it will be seen that, if anything, the West Coast is less trustworthy than the East Coast route. An examination of the dates will show that in August last the Cape was quite cut off, and that on various other occasions the West Coast route has been only just restored when the East Coast cables fail, and *vice versâ*:—

The Telephone Service.—In connection with the London County Council Telephone Conference, a report of which appears in another column, the *City Press* quotes the resolution passed: "That, in the event of the Post Office not undertaking a telephone service, it is desirable that the local and central authorities of London should at once combine to secure an efficient and cheap service," and adds editorially, "We agree that in one way or another the metropolis must have an efficient service on reasonable terms." This seems to be the general opinion of all who have anything to do with the service.

CONTRACTS OPEN AND CLOSED.

OPEN.

Barnet.—June 24th. The Lighting Committee want tenders from firms willing to undertake such installation for lighting the district by electricity. Particulars at the Council offices, and see "Official Notices" June 10th.

Belfast.—June 22nd. The Corporation wants tenders for the supply of turned and bored C. I. pipes and C. I. bell mouths for electric cable conduits. Particulars from Mr. V. A H. McCowen, Corporation electrical engineer; also see our "Official Notices" this week.

Bethnal Green.—June 28th. The Board of Guardians invite tenders for supplying the necessary plant and installing the electric light at the new infirmary, Palestine Place. For particulars see our "Official Notices" June 10th.

Bournemouth.—June 20th. The Corporation is inviting tenders for the supply, &c., of cables, arc lamps, incandescent lamps, wiring, switchboards, fittings, &c.; also steam dynamo, &c. Particulars from the borough engineer, Mr. F. W. Lacey, also see our "Official Notices" May 27th.

Bulgaria.—June 27th. Some little time ago the municipal authorities of Sophia, Bulgaria, invited tenders for the concession for the electric lighting of the public streets of the city, and for the construction and working of an electric tramway. The authorities are again inviting tenders, until the 27th inst., for this concession, particulars of which may be obtained from above.

Cardiff.—June 28th. The Corporation wants tenders for two water-tube boilers for the electricity works. Particulars from the borough electrical engineer, Mr. Appelbee; also see our "Official Notices."

East London (Cape Colony).—June 28th. The Town Council is inviting tenders for erection of buildings and the supply of electric lighting machinery, electric tramcars, plant, rails, &c., and for their maintenance for six months from completion. Particulars from Messrs. Dyer & Dyer, 17, Aldermanbury, London, E.C., on payment of £5, repayable on the receipt of a *bonâ fide* tender.

Edinburgh.—June 30th. The Corporation wants tenders for the supply of copper strip for electric conductors. Particulars from the resident electrical engineer, and see our "Official Notices" this week.

France.—June 30th. Tenders are being invited by the municipal authorities of St. Laurent de la Salanque, a small town of about 4,500 inhabitants in the Pyrenées Orientales, for the concession for the electric lighting of the public streets. Full particulars may be obtained from, and tenders to be sent to, Le Maire, de St. Laurent de la Salanque, Pyrenées Orientales, France.

Heckmondwike.—June 30th. The directors of the Heckmondwike Industrial Co-operative Wholesale Society want tenders for an electric light installation (about 500 lights) including generating plant for their premises. Consulting electrical engineer, Mr. Walter Leake, 51, Victoria Buildings, Manchester. See our "Official Notices" this week.

Hull.—July 1st. The Corporation wants tenders for wiring and the supply of fittings for the East Hull Baths. Particulars from the city engineer (Mr. A. E. White). See our "Official Notices" this week.

Leeds.—June 16th. The Council requires tenders for two engines and dynamos of about 1,000 H.P. each; also for 50 electric tramcars. Particulars from Dr. John Hopkinson; also see our "Official Notices."

London.—June 21st. The London County Council is inviting tenders for engines, dynamos, accumulators, switchboards, feeders, distributors, and service mains and all accessories, to be fixed complete in buildings at the Crossness Outfall Works, near Erith, Kent. The L.C.C. also requires tenders for providing and fixing cables, wires, conductors, casing, pendants, brackets, and other fittings, columns, lanterns, lamps, switches, and switchboards, distributing boards, fuses, cut-outs, &c., necessary for the lighting by electricity of the Crossness pumping station and works, near Erith, Kent. Particulars of both contracts from the Engineer's Department, County Hall, Spring Gardens, S.W. See also our "Official Notices" May 27th.

Newington.—July 1st. The Vestry of St. Mary invites tenders for the construction, supply, and erection of boilers, pumps, steam and water mains, water tank, surface condenser, fuel economiser, &c., for the electricity works in Penrose Street, Walworth. Consulting engineers, Messrs. Kincaid, Waller & Manville. See our "Official Notices" this week.

Southampton.—June 20th. The Corporation invites tenders for the supply and erection of lamp columns, arc and incandescent lamps, automatic switches and fittings. Consulting engineers, Messrs. Kincaid, Waller & Manville. See our "Official Notices" June 3rd.

Tynemouth.—June 20th. The Corporation wants tenders for the supply of steam dynamos, balancer and boosters, &c. Consulting engineers, Messrs. Lacey, Clirehugh & Sillar. See our "Official Notices" June 3rd, for particulars.

Victoria.—June 24th. The Council of the city of Hawthorne (Colony of Victoria, Australia) is inviting tenders for the supply and erection of buildings, boilers, engines, dynamos, transformers, mains, meters, arc lamps, poles; also running the plant for three years. See our "Official Notices" March 11th.

Wimbledon.—June 27th. The District Council wants tenders for the installation of the electric light mains and fittings in the new depôt buildings in Queen's Road, Wimbledon. Particulars from the Council's engineer, Mr. C. H. Cooper. See our "Official Notices" this week.

York.—June 24th. The Corporation is inviting tenders for the erection of an electric light station. Particulars from the City engineer, Guildhall.

CLOSED.

Aberdeen.—A committee of the Harbour Board has accepted the tender of Messrs. Lucy & Co., Oxford, to erect lamps and standards for the electric lighting of the Quays.

Belgium.—Mr. G. Boty, of Brussels, submitted the lowest tender (12,387 fr.) for the installation of electric lighting in the Bibliothèque Royale, Place du Musée, Brussels. Three other firms tendered.

Hammersmith.—It is proposed to give Messrs. Ferranti the contract for the extension of the rectifiers and switching apparatus, at £640 and £154 respectively.

Leyton.—The contract for a secondary battery for the District Council has been given to the "Hart" Secondary Battery Company, Limited, The battery consists of 170 cells of a capacity of 1,100 ampere hours at a normal discharge rate of 200 amperes and a maximum discharge rate of 600 amperes for 1 hour. The following were the tenders received:—

Headland Battery Company, Limited	£1,402	0
"Hart" Secondary Battery Syndicate, Limited *(accepted)*	1,480	0
General Electric Company, Limited	1,526	0
E. P. S. Company	1,562	10
Tudor Accumulator Company, Limited	1,780	0
Chloride Electric Storage Company, Limited	1,980	0
Epstein Accumulator Company	2,081	0
D.P. Battery Company, Limited..	2,400	0

Sunderland.—The tender of Messrs. Abbott & Co., of Gateshead, for steam piping, has been accepted by the Council in connection with the electric lighting extensions.

FORTHCOMING EVENT.

1898.

Friday, June 24th at 5 p.m.—Physical Society. Agenda:—1. Exhibition of an Apparatus illustrating the action of two coupled Electric Motors, by Prof. Carus-Wilson; 2. Exhibition of Weedon's Expansion of Solids Apparatus, by Mr. J. Quick; 3. "On the Theory of the Hall Effect in a Binary Electrolyte." By F. G. Donnan, M.A., Ph. D.

NOTES.

Société Internationale des Electriciens.—The monthly meeting of the Société des Electriciens was held on June 1st at 8.30 p.m., with M. R. V. Picou in the chair. M. Ducretet performed a series of experiments on the Hertz system of wireless telegraphy with M. Branly's radio-conducting tube, and various other accessories invented by him. At the transmitting station we find, in the first place, a battery feeding a small electro-motor which works a mercury interrupter. This interrupter is introduced into the circuit which supplies the energy to the inductive circuit of a Ruhmkorff coil. The current which is derived from a special battery passes through the interrupter, a hand switch which is also worked by mercury, and which enables the circuit to be very quickly opened and closed, and the inductive circuit of a Ruhmkorff coil, which is capable of producing a spark ·4 of a metre in length. The two extremities of the induced circuit meet an oscillator which consists of two balls placed opposite to two separate rods, which meet two spheres placed in an insulating liquid. It is in this medium that the spark is emitted. One of the wires of the induced circuit is connected to earth, and the other to a large vertical insulated rod. The electric waves start from this rod and proceed to a receiving station where are installed a Branly radio-conducting tube with an automatic tapper and an automatic Morse register. All the electric waves sent into the atmosphere are registered automatically. M. X. Gosselin then showed in projection some of the best known potentiometers at present employed in various industries.

The Ameer and the Dynamo.—If any of our readers should desire to obtain any further particulars of the career of Sir Thos. Salter Pyne, to which we alluded on page 790 of last week's issue, we would refer them to the April issue of the *Indian and Eastern Engineer*, from whence our information was derived.

The Alexandra Palace Electric Tramway.—The Electricitäts-Gesellschaft Wandruszka & Cie, of Berlin, who are the general European agents for the Steel Motor and Johnson Company, in Johnstown and Lorrain, U.S.A., some months ago entered into an agreement by which they had to erect and work an electric railway in the grounds of the Alexandra Palace. As already mentioned in our columns the line has been in operation since May 15th, and is giving satisfaction. The length of the line is 1·2 miles, on which four motor cars, of a seating capacity of 50 passengers each, are running. The mean takings have proved up to the present to be £12 5s. per day, a good result. The track is double and of ordinary gauge throughout, and the line is equipped with overhead wires on centre poles. At the generating station, the generating plant is in duplicate for the purpose of reserve. The average gradient of the whole line is 1 in 13. The motor cars are fitted with double equipments of the Steel Motor, type 18. On the highest gradient, which is 1 in 11, the motors want a supply of current equal to 37 amperes, with an E.M.F. of 510 volts. Although the seating capacity of the cars is stated as 50, we are informed that they have been carrying 64 passengers.

Municipal Electrical Association.—At the business meeting of this Association, held at the Royal United Service Institution, Whitehall, S.W., on Saturday last, it was resolved to hold the next Convention in Bristol, and Mr. H. Faraday Proctor was elected President. Mr. J. H. Ryder, of Plymouth, and Mr. G. H. Cottam, of Hampstead, were elected Vice-Presidents; Mr. Wilmshurst, Halifax, and Mr. J. F. C. Snell, Sunderland, being elected members of the Council, to serve three years. Bailie Maclay, Glasgow, and Dr. Panton, Bolton, were also elected members of the Council, each to serve one year. Mr. G. H. Cottam was re-elected hon. treasurer, and Mr. W. A. Godfrey hon. auditor. The President stated that the Council had had such valuable help from Councillor Pearson, of Bristol, that they found with extreme regret the fact that, under the constitution, he was not eligible to serve upon the Council during the coming year, and with the idea of retaining his valuable help, and his great knowledge of legal matters, it was considered desirable by the Council to ask the Association to appoint Mr. Pearson as hon. solicitor, and he was elected unanimously. The appointment of hon. secretary was left with the Council.

Electrical Engineers wanted by the War Office.—We understand that the Under-Secretary of State for War, War Office, London, is to appoint an electrical engineer with thorough mechanical and electrical training and experience of electric lighting work, including the distribution of current. He will be required to assist in the preparation of particulars and supervision of the execution of electric lighting contracts at Aldershot. An electrical and mechanical draughtsman is also required for the preparation of plans and record drawings in connection with the above. He must be thoroughly competent, and must have had experience in the office of a consulting electrical engineer or contractor for large electric light installations. Applications, by letter only, stating age, experience, and salary required, and furnishing references, to Under-Secretary of State for War, War Office, London.

Röntgen Rays in War.—In the House of Commons on Friday last week, in reply to General Russell, Mr. Brodrick said :—The Röntgen ray apparatus, which is a very recent invention, is very difficult to adapt for field service, and was not carried with the field army in the recent operations. From the returns the medical authorities do not consider there was a single case in which life could have been saved by the use of the apparatus. Two sets are now in Egypt, and one more will be sent out shortly. Two have been adapted as far as possible for field service, and one is for use in the base hospital. Sir J. Fergusson asked whether 400 men were not wounded by bullets, and whether the apparatus would not have been most useful in locating the bullets. Mr. Brodrick.—The senior medical officer has gone carefully into the cases and has been unable to trace any single case in which the apparatus would have been specially useful or in which an operation would have been carried out more successfully by the use of the rays.

Wireless Telegraphy.—The following copy of a letter addressed to the President of the Académie des Sciences, Paris, June 12th, 1898, has been handed to us for publication :—

"Sir,—The first station for the *Hertz system of wireless telegraphy* is established at my works. The mast rises to a height of 26 metres from the ground (the height of the ground is about 55 metres). This mast overtops the neighbouring houses, and can be seen from a great distance. The conducting wire, which is insulated and attached to the top of this mast is 32 metres long. This collector of the electric waves goes into my laboratory, and is connected with one of the electrodes of the Branly *radio-conductor* of the receiving station, the other electrode is connected to earth.

"Yesterday, Saturday, from 2.30 to 3.40 p.m., during the storm my *automatic receiver* registered 311 *intermittent atmospheric discharges* as they made their presence felt on the *collecting mast*. These discharges were registered *before* the appearance of the lightning and the noise of the thunder.—Believe me, Sir, your devoted and obedient servant, E. DUCRETET.

This note cancels that dated the 7th, which is less complete, the collecting mast not having been erected at that date."

The Langdon-Davies Motor.—The Davies Motor Company inform us that the manufacture of the Langdon-Davies motor having grown too large to be carried on in their present works, they have transferred the English manufacturing rights to a new company under the name of the Langdon-Davies Electric Motor Company, Limited, which has taken and equipped considerably larger works at 101, Southwark Street, S.E., to whom all communications on the subject of motors should be addressed. The instrument business, with the exception of ammeters, voltmeters, and the other electric lighting instruments still continues at the above address as for the eight years past, and previously to that at Westminster. The company has reverted to the old name of Nalder Bros. & Co., Limited, and its business will be carried on, as it has continuously been for the past 10 years, under the two partners in the original firm of Nalder & Co., Messrs. Crawley and Soames, as its managing directors, and with the same staff. To prevent confusion, the business previously carried on at 16, Red Lion Street, is now divided into the three following totally distinct concerns, the latter two having taken over the branches specified :—Nalder Bros. & Co., Limited, as above. Nalder Bros. & Thompson, 34, Queen Street, Cheapside, E.C., ammeters, voltmeters, switchboards, &c. The Langdon-Davies Electric Motor Company, Limited, 101, Southwark Street, S.E., alternate current motors.

British Association, Bristol, 1898.—The local hon. secretaries, Messrs. Arthur Lee and Bertram M. H. Rogers, are sending out the report of the executive of the B.A. Local Committee held on June 6th, giving details of the arrangements which are being made for the September meeting at Bristol. Particulars as to presidents of the various sections and other information appeared in our April 8th issue.

Personal.—Mr. George C. Sillar, M.Inst.E.E., who for nearly 17 years has been connected with the Brush Electrical Engineering Company, Limited, in various capacities, has been appointed general manager of the Otis Elevator Company, Limited, Queen Victoria Street.

Mr. W. H. Allen, of the Queen's Engineering Works, Bedford, is now a justice of the peace for Bedfordshire.

Forthcoming Prospectus.—*The World* understands that the prospectus of the "Cotsworth" Arc Lamp and Electric Lighting Syndicate, Limited, will be issued at no remote date. "The lamp is said to be the simplest ever offered to the public, while the cost of production is estimated at a very low figure."

Will.—The late Mr. Thos. Holliday, Edgerton, Huddersfield, of the firm of Read, Holliday & Co., Limited, electrical engineers, &c., has left gross estate £108,618 16s. 1d.

Marriages.—Mr. Guy C. Fricker, of Messrs. Fricker, Miller & Co., was married on Wednesday last week, June 8th, to Miss Lena Bockett, third daughter of the late Mr. John Bockett, solicitor, Lincoln's Inn Fields. The "happy pair" have gone for a three weeks' tour in Switzerland.

Mr. Thomas Harding Churton was married on 8th inst. to Ethel Blanche, younger daughter of Marshall Nicholson, Esq., of Middleton Hall, Leeds, at St. Mary's Church, Middleton. Mr. Harding Churton, of Leeds, needs no introduction to the electrical fraternity.

"Stand-by Charges."—Mr. Robert C. Quin, the borough electrical and tramway engineer at Blackpool, read a paper before the Municipal Electrical Association on "Stand-by Charges," raising the question of the unfairness to electrical undertakers to be compelled to find capital for plant usually lying idle to supply consumers whose premises are equipped with their own generating plant. We refrain from commenting on this paper, as the Council of the Association decided at the last moment to withdraw it from discussion, and to make it the subject of a report from their body.

Blackpool and the Overhead Trolley.—We understand that, after careful consideration, the Board of Trade has decided to sanction the overhead trolley system of electric traction on the Corporation tramways on the condition that the special regulations made by the department are strictly complied with.

Paris Exhibition of 1900.—The Royal Commission, of which the Prince of Wales is chairman, are now prepared to circulate information respecting the Exhibition. The classification and rules for exhibitors, together with forms of application for space, can be obtained by applying to the Secretary of the Royal Commission, Paris Exhibition 1900, St. Stephen's House, Westminster, S.W.

Presentation.—On 7th inst., the superintendent engineer of the Northern Electrical Engineering and Plating Company, Limited (Mr. Thomas W. Ogilvy), was, at Newcastle, presented with a handsome cruet and a pair of bronze ornaments subscribed for by the employés of the firm on the occasion of his marriage.

Burglary.—Messrs. E. P. Allam & Co., electrical engineers, of 14, Hatton Garden, E.C., ask us to state that a few days ago their premises were broken into and an Evershed generator, No. 125, and a Nalder Bros. ohmmeter, No. 6,418, were stolen. They will be pleased to reward anyone giving information which will lead to the recovery of the instruments and the apprehension of the culprit.

"Truth" on Trams.—After condemning the existing tram service at Hull, Labby asks in *Truth:* "Why does not the municipality start electric trams?" and proceeds to eulogise the overhead trolley system. We are quite at one with him in this matter, but he is not *au fait* in regard to the progress of mechanical traction, or he would know that the Hull Council some time ago gave out contracts for electrical equipment of the trams on the trolley system, and the first rail was laid last week.

Verband Deutscher Electrotechniker.—The sixth annual meeting of the Verband Deutscher Electrotechniker was held at Frankfort-on-Main from the 2nd to the 5th inst. Among the papers read was one by Dr. Th. Bruger "On a Direct Indicating Phase Meter," and one by Dr. M. Levi on "Progress with Röntgen Rays."

The Royal Society.—The following papers were down for reading yesterday afternoon:—C. Coleridge Farr, "On some Expressions for the Radial and Axial Components of the Magnetic Force in the Interior of Solenoids of Circular Cross Section." A. A. C. Swinton, "On the Source of the Röntgen Rays in Focus Tubes." Prof. W. Ramsay, F.R.S., and M. W. Travers, "On the Constituents of Argon."

Appointment Vacant.—The Croydon County Polytechnic is wanting a teacher of electrical engineering. For particulars of qualifications, &c., see our "Official Notices" this week.

NEW COMPANIES REGISTERED.

Asbestos and Rubber Company, Limited (57,673).—Registered June 7th, with capital £10,000 in £1 shares, to acquire the business carried on by Stanley, Morrison & Co. at Hull and Sheffield, to adopt a certain agreement, and to carry on the business of India-rubber, gutta-percha, and asbestos manufacturers, ship and engineers' stores manufacturers, electricians, telegraph and electrical engineers and contractors, cable and telegraphic instrument manufacturers. The subscribers (with one share each) are:—T. B. Hooper, 15, Old Jewry Chambers, E.C., solicitor; E. B. Morrison, 33, Greencroft Gardens, N.W., gentleman; R. M. Albery, Bowery Farm House, Wraysbury, Bucks, farmer; B. S. Ince, 1, Church Court, Old Jewry, E.C., printer; H. Pearce, 129, Cheapside, E.C., stationer; F. D. Leslie, 74, Coleman Street, E.C., accountant; O. M. Bolton, 431, Liverpool Road, N., clerk. The number of directors is not to be less than two nor more than five. The first are:—A. Morrison (chairman), B. Gee, and J. Cuthbert. Qualification, £100; remuneration as fixed by the company. Registered by Lumley & Lumley, 15, Old Jewry Chambers, E.C.

Harry W. Cox, Limited (57,703).—Registered June 8th, with capital £2,000 in £1 shares, to acquire and carry out business as an electrician, electrical and mechanical engineer, contractor, model maker, and manufacturer of electrical and scientific appliances, carried on by H. W. C. Cox at 10, 11 and 28, Cursitor Street, Chancery Lane, W.C. The subscribers (with one share each) are:—C. F. Leighton, Manorfield, St. Albans, gentleman; A. Greek, 41, Oakley Road, Canonbury, N., clerk; B. Aylward, 35, Brook Green, W., gentleman; F. R. Nutt, 17, Cornwall Cottages, Essex Road, N., electrician; H. W. C. Cox, 51, Cricketfield Road, Hackney Downs; E. F. C. Savory, 2, Clement's Inn, W.C., gentleman; Mrs. M. Cox, 51, Cricketfield Road, Hackney Downs. The number of directors is not to be less than three or more than five; H. W. C. Cox, B. Aylward, and C. F. Leighton. Qualification, £100; remuneration as fixed by the company. Registered office, 10 and 11, Cursitor Street, Chancery Lane, W.C.

Biograph and Mutoscope Company for France, Limited (57,708).—Registered June 9th, with capital £100,000 in £1 shares, to acquire certain inventions for the reproduction of objects in motion, and the French patent rights for the same, to adopt an agreement with A. Grove, J. S. Montagu, and J. W. Orde, and to carry on the business of mutoscope, biograph, and mutograph manufacturers, battery makers, tablet and diaphragm manufacturers, electricians, electrical, mechanical, and chemical engineers, iron and brass founders, &c. The subscribers (with one share each) are:—E. B. Koopman, 18, Great Winchester Street, E.C., director; T. N. A. Grove, J.P., 11, Hans Road, S.W.; J. S. Montagu, M.P., 29, Cornhill, E.C.; J. W. Orde, 29, Cornhill, E.C., gentleman; E. Baker, 29, Cornhill, E.C., secretary; N. P. A. Brady, 81, Cannon Street, E.C., gentleman; A. R. Roberts, 13, Walbrook, E.C., solicitor. The number of directors is not to be less than two nor more than seven; the subscribers are to appoint the first; qualification, 100 shares; remuneration, £1,200 per annum and a share in the profits, divisible. Registered office, 29, Cornhill, E.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

British Electric Traction Company, Limited (49,855).—This company's annual return was filed on May 7th, when 30,000 ordinary and 10,000 preference shares were taken up out of a capital of £600,000 in £10 shares. £10 per share has been called on the ordinary, and £6 10s. per share (including £2 10s. per share premium) has been called on the preference. £354,817 has been paid, £10,183 is in arrears, and £57 has been received in advance.

India-Rubber, Gutta-Percha, and Telegraph Works Company, Limited (1,122 C).—This company's annual return was filed on May 27th, when 50,000 shares were taken up and paid for in full out of a capital of £812,000 in £10 shares.

Indo-European Telegraph Company, Limited (3,953).—This company's annual return was filed on May 10th, when 17,000 shares were taken up and paid for in full out of a capital of £450,000 in £25 shares.

London Platino-Brazilian Telegraph Company, Limited (12,093).—This company's annual return was filed on May 23rd, when 37,548 shares were taken up and paid for in full out of a capital of £400,000 in £10 shares.

Elmore's German and Austro-Hungarian Metal Company, Limited (32,457).—This company's annual return was filed on June 3rd. The capital is £162,981, divided into 50,000 preference shares of £2 each, and 62,981 ordinary shares of £1 each. All the ordinary and 22,275 preference have been taken up, and 25,000 ordinary are considered as paid. £1 per share has been called on the 37,981 ordinary, and £2 per share on the preference, and £82,531 has been paid. 1,730 shares have been forfeited, and 10,337 shares cancelled, and £22,131 12s. 10d. has been paid in respect thereof.

Oriental Telephone and Electric Company, Limited (40,691).—This company's annual return was filed on May 12th, when 171,504 shares were taken up out of a capital of £200,000 in £1 shares. 171,497 shares are considered as paid, and £7 has been received on the others.

Altrincham Electric Supply, Limited (40,795).—This company's annual return was filed on May 27th, when 25,000 shares were taken up and paid for in full out of a capital of £50,000 in £1 shares.

Rand Central Electric Works, Limited (43,712).—This company's annual return was filed on May 20th, when the capital of £300,000 in £1 shares was fully taken up. 25,000 shares are considered as paid, and £275,000 has been received on the others.

Electric Cycle Syndicate, Limited (36,227).—This company's annual return was filed on April 1st, when 2,827 shares were taken up out of a capital of £3,000 in £1 shares. 1,000 shares are considered as paid, and £1,742 10s. has been received on the others, leaving £84 10s. in arrears.

Electric Exploitation Company, Limited (40,256).—This company's annual return was filed on April 22nd, when 20,367 shares were taken up out of a capital of £25,000 in £1 shares. 20,000 are considered as paid, and £360 has been paid on the others, leaving £7 in arrears.

CITY NOTES.

Western Brazilian Telegraph Company.

The thirty-fifth ordinary general meeting of the above company was held on Thursday, June 9th, at Winchester House, Old Broad Street, Mr. W. S. Andrews presiding.

The Chairman, in moving the adoption of the report, said he was glad to say they were able to meet the shareholders under rather better auspices than had been the case for some little time back. There was an increase in the revenue and a decrease in the expenses. The revenue for the half-year had amounted to £72,332 9s. 10d., as compared with £71,315 12s. 2d., showing an increase of £1,116 17s. 8d., and that would have been rather more had it not been for special circumstances to which he would presently refer. With regard to the expenses, they were £37,774 1s. 11d., as compared with £38,160 19s. 4d., consequently there was a decrease of £386 17s. 5d. Dealing first with the expenses, there was a total increase of £1,211 under abstract A, but of that maintenance accounted for £750, and stores and new apparatus for another £524, and there was an increase of £400 under miscellaneous. The decreases in abstract A, were travelling, £300; and stationery and printing, £83; the net result being an increase of £1,211. Abstract B, which dealt with their shipping, was always a source of considerable anxiety with them, and he was very pleased to say that under that head there was a notable decrease, because in the period under review they dispensed with the services of the second ship that they had been obliged to employ previously—the *Buccaneer*—and the saving amounted to £3,477 15s. 5d., although their other ship, as a matter of fact, had to do all the same work, and did it very satisfactorily, of course, with an increased consumption of coal and other expenses. That saving of £3,477 he would have liked the shareholders to have had the immediate benefit of, but it had been partly absorbed by certain special expenses incurred in Buenos Ayres on account of the attack—which might have been rather a dangerous one for them—made under the guise of tariff changes. They had to defend themselves from that attack, and it was rather a costly defence. Then, in addition to that, they had maintenance and repair expenses, and new apparatus, which ran away with some £2,500 of that reduction, which they would otherwise have got the entire advantage of. In abstract C, out of the total increase of £167, £154 12s. was owing to arbitration expenses, so that was practically about the same. The result was that they were left with a decrease of expenses amounting to £386 17s., and he was glad to say that decrease did not end with the period under review, but it was going on and increasing, so that there was no doubt by-and-bye they would have a better tale to tell the shareholders with regard to the expenditure, even than they had that day. Dealing with the net revenue, there was the balance from last half-year, £3,867 15s. 2d.; there was the dividend on the shares in the Platino Company, £11,094—against none in the corresponding period—and the balance on their own working, after payment of expenses, amounted to £34,558 7s. 11d.—together, £49,520 3s. 1d. They had to deduct £8,060 8s. 4d. for interest on debentures and debenture stock; £2,159 12s. 4d. for sinking fund for the redemption of the new debentures, and, with £5,000 added to the reserve fund, they got a total of £15,220 0s. 8d., which left £34,300 2s. 5d. available. They proposed to declare a dividend of 6s. 9d. per share, and to carry forward £1,428 5s. 11d. to the current period. That distribution was equal to a dividend of 3¼ per cent. per annum, and consequently it was the best dividend that they had received since 1891, when it was at the rate of 4 per cent. That pointed to an improvement in their affairs which must be gratifying to all of them, but gratifying as was that comparison it did not end there. They not only paid more than double the dividend that they paid in the corresponding period which was 3s. per share, but the net revenue earned during the half year was more than double that earned in the six months ending June, 1896, and on this occasion they were able to pay more than double the dividend and add £5,000 to the reserve, instead of having to assist their smaller dividend as they did in 1896, by taking £7,500 out of the reserve. All they wanted now was a little revival in the trade of Brazil, and their position would be decidedly more satisfactory. The exchange had been 7⅜d. only as against 8⅝d., but, of course, under the new mode of collection, that was not so serious as it appeared. Still, under the new method, before fixing the rate of exchange for the coming three months, the Government took the average rates of exchange for the preceding period, and, of course, if the average for the preceding three months was higher than they got for the next three, when the rate had been fixed, they lost money. Strange to say, ever since that arrangement was made for the collection of the exchange, it had been going down, so that although the rate had been fixed at a certain point they had never actually got it, but something below it. At present the exchange was going up, and consequently their receipts were going up with it. The augmentation of the revenues of their company, and of those of the Platino, were continuing. Already they had reached a point in their revenue a good deal above the corresponding period, and therefore he hoped—he might almost say he was confident—that they would be able to tell the shareholders even a better story than the present when the current half-year's business came to be laid before them. No doubt they would have remarked that the new president-elect of the United States of Brazil had come over to this country to arrange important matters in connection with Brazil. There was no doubt that Brazil needed a period of rest and recuperation, and it was earnestly to be hoped that she might obtain it. When the great natural riches of the country were considered they had every reason to expect that, with a careful administration of the revenues, a very gratifying and prosperous result might yet be produced. He was sure they would all wish the president-elect every success in his patriotic efforts, and God speed in his important mission for the benefit of his magnificent country. There was one other question in the report which he could not say much upon. Undoubtedly the shareholders would have noticed that paragraph in which they stated that negotiations for closer working between their company and the Brazilian Submarine Telegraph Company had been in progress. Those negotiations were not completed yet. They were progressing satisfactorily and pretty actively, and they believed they would result successfully, and that the results would be welcome alike to the governments, the public, and the companies. Of course, nowadays it was necessary to do things which were agreeable all round, and not to shut one's eyes or direct them into a narrow focus. He would, therefore, ask them not to put any questions to him in reference to that subject, but if there were any other matters shareholders wished information upon he would be very happy to afford it them.

Lord Richard H. Browne seconded the motion for the adoption of the report and it was carried without discussion.

The retiring directors having been re-elected, Major Cotton, in moving the re-election of the auditors, said he thought they must congratulate the chairman and directors upon the improved state of affairs they had put before them, and upon the very hopeful prospects for the future. He hoped that the negotiations which were being carried on for closer working with the Brazilian Company might soon be brought to a satisfactory termination for the benefit of the shareholders especially.

The motion having been carried, the proceedings terminated with a vote of thanks to the chairman and directors.

British Thomson-Houston Company, Limited.

The third ordinary general meeting was held on Friday last at the offices of the company, Cannon Street.

Mr. E. A. Lazarus, the chairman of the company, presided, and in moving the adoption of the report, observed that their business had gone on very quickly during the year, and they had had to extend their offices and premises a good deal. With regard to the principal traction contracts now in hand, they had the city tramways of Dublin, Cork, which was also a lighting concern, the Central London Railway, Middlesbrough, Sheffield, Dudley-Stourbridge, and Oldham-Ashton. Those were the principal inclusive contracts, but they had a good deal of other business. They did not rely on patents for their success, but on the way in which they did their work. The industry, however, had been and was developing very quickly, and they had latterly found that a good many competitors were infringing their patents. They had spent about £100,000 on acquiring them, and they were therefore seriously considering whether it might not be worth something more to protect them.

Sir Thomas Thompson seconded the motion, which was adopted, and dividends of 10 per cent. for the year on the "A" and "B" shares were afterwards declared.

Elmore's German and Austro-Hungarian Metal Company, Limited.

The directors have been this week inviting applications for an issue of £60,000 6 per cent. debenture stock at par. The trustees are Lord Farrer, of Abinger, and Mr. J. R. Hollond. Applications were received for over £37,000 before the issue of the prospectus. The following table shows the increase in the value of the sales for the past three years and the balances of the profit and loss account of the "Metall" Company for the same period:—

1895 sales	... £17,052 12 3	...	Loss	... £1,575 9 5
1896 sales	... 24,747 17 9	...	Profit	... 347 18 3
1897 sales	... 37,929 18 6	...	Profit	... 3,202 11 0

while the sum of £5,748 11s. 5d. was deducted from revenue by way of depreciation during the same period. The value of the sales for the present year to the 1st inst. shows an increase of 90 per cent. as compared with that for the same period last year. In 1897 the "Metall" Company was given a contract to supply the total requirements of the German Navy for a period of three years. This contract was, by arrangement, cancelled in April last, and a new one has been entered into, whereby the company is to supply all tubes over 1⅜ inch in diameter for the next two years, but at greatly enhanced prices. Notwithstanding the increased production, the company was in 1897, and is now, unable to accept even a moiety of the orders offered by the large shipyards and private customers. The output for 1897 was 411 tons; the new plant, now nearly completed, when fully at work, is estimated to produce 1,100 tons per annum. The list closed yesterday afternoon.

Callender's Cable and Construction Company.

The report of the directors for the year ended December 31st last, states that the accounts show a balance at the credit of profit and loss of £24,746, from which must be deducted interest on debentures, £4,050, appropriation for depreciation of machinery, plant, &c., £3,000, leaving an available balance of £17,696. The directors now propose to pay a dividend at the rate of 10 per cent. per annum (clear of income-tax), being 10s. per share, whereof 4s. was paid on October 31st, 1897, as an interim dividend, leaving 6s. per share to be paid now, absorbing £10,000, and a bonus of 2s. 6d. per share, absorbing £2,500, leaving £5,196 to be carried forward. The total payment for interest and bonus on account of 1897 will therefore be at the rate of 12½ per cent. per annum. The expenditure on buildings, plant, and machinery has proved beneficial to the business, and has enabled it to produce better and cheaper cables than at any time in the past. The plant and premises have been maintained in a thorough state of efficiency, and the cost not only of all repairs and maintenance, but of alterations and improvements, has been debited against the year's profits. Some of the shares held by the company have been disposed of, and others have necessarily been acquired in connection with the business. The present market value of the shares held exceeds by several thousand pounds the value shown in the balance sheet, but it is not proposed to deal with this excess at present. The business transacted in 1897 was again much larger than that in previous years, and the directors are glad to report that it continues to increase, and that the output of the factory during the last five months has exceeded their utmost expectations. Although extensive additions to plant, machinery, and buildings were made in 1897, it became evident towards the close of that year that still further additions were required to cope with the fast growing business, and that these must be on a much larger scale than heretofore. The land at Erith which the company owns had been utilised nearly to its full capacity, and was clearly insufficient for these extensions, and, after lengthy negotiations, the directors have succeeded in purchasing about 25 acres of freehold land adjoining the present factory, which will assure ample space for extensions for many years to come. The present capital is quite insufficient to enable the company to carry on their rapidly increasing business to the best advantage and to meet the cost of the necessary extensions of the works. It is therefore proposed to increase the capital by the creation of 20,000 preference shares of £5 each, and the requisite notice of an extraordinary general meeting has been given for the purpose. It is not contemplated to issue more than 10,000 of these shares at the present time, and these will be offered first to the existing shareholders.

The second annual general meeting of shareholders of the above company was held on Wednesday last at the offices, 90, Cannon Street, Mr. Henry Drake presiding. The Chairman, in moving the adoption of the report, said he hoped the shareholders would consider the accounts satisfactory. The directors were very well satisfied with the progress of the company. They had had a very prosperous year, and the figures in the balance sheet carried out that view. There were one or two items in the accounts to which he would call attention, as he thought they prove interesting. In the first place they would observe that they had spent £11,355 on enlargement of works and additional plant, which was in addition to the £2,985 written off the profits, for repairs and maintenance. In 1896 they spent nearly the same amount—£11,238. The next item he would call their attention to was that of cable drums, which stood at £2,803 as against £2,170 last year. That afforded a very fair indication of the increase of the business, because they used those drums for winding their cables on, and the amount stood at about one-third more than last year. The next item was stock in hand, which was only £1,200 more than last year. Then came expenditure on contracts in course of execution and sundry debtors, and there they had an increase of £26,000—that was to say, those two items, together, came to about £100,000 as against £74,000, which was a very satisfactory thing. Cash at the bank and bills receivable stood at £9,136 as against £15,229, which, he thought, showed that they were using their means as closely as they could. Shares in other companies stood at £6,603, as against £8,800. That arose in this way: they had sold shares that they held in 1896, and they had placed the money that they had received from that to the credit of that account. They had taken up a few more shares, rendered necessary in the course of their business, but they had not increased the value of the shares that they held; they had left them simply at the value that they stood in the last balance-sheet. The result was, that there was an undisclosed profit on these shares, probably amounting to about £10,000, but they did not wish to deal with that money until they had realised it. Coming to the profit and loss account, the balance to the credit of that account was £17,696, as against £13,507, which was an increase of £4,000. They proposed to pay 6s. a share, being the balance of 10s. per share dividend, which was 10 per cent. on the capital. That would take £10,000. They also proposed to pay a bonus of 2s. 6d. per share, which would absorb another £2,500, which would make a total distribution of 12½ per cent., leaving £5,196 to carry forward to next year's account. He hoped the shareholders would consider those results satisfactory. The business of the company had very largely increased, and that led him to refer to the proposed increase of capital, to which reference was made in the report. It was absolutely necessary that their works should be extended. At present they had not sufficient room to carry on the business they had in hand, or the work which they would in all probability get in the future. They had considered the question of extension for a long time, and at last they had had an opportunity of purchasing 25 acres of land adjoining their factory. It had no river frontage, but as they already had as much river frontage as they required, that was immaterial, and it enabled them to buy the land very cheaply. It only cost them about £130 an acre, which, for their purposes, was a very small sum indeed. There was a small quantity of land on the other side of their works for which they were in negotiation, and for which they were prepared to give £500 an acre, but when the 25 acres adjoining their own place was offered them, they thought it far better to buy it than a smaller site, where they would not be able to place so much space between their buildings. That, of course, brought him to the point of increased capital. Their present capital was quite insufficient, and therefore they had sent out notices for an extraordinary meeting to increase the capital by £100,000, and there was a statement made in the report on that matter which he wished to qualify. It was stated that it was not contemplated to issue more than £50,000 of that capital at the present time, but since the report was issued the directors had again gone carefully into the matter, and had come to the conclusion that they must issue the whole, probably extending the period of payment over a longer time than they would otherwise have done.

Lieut.-Colonel G. A. Elliot seconded the motion, and the report was adopted.

Mr. T. O. Callender, the managing director, addressed a few words to the shareholders as to the progress of the business, and said he was glad to say that, good as was their business in 1897, it was nothing to what they were doing now. Their only difficulty was to turn out the work, and not only did they want further working capital, but also they needed more plant and machinery. It was very likely that within the next two or three years the business they were at present doing might be doubled, and it might interest the shareholders to know that 90 per cent. of the company's business was with leading corporations throughout the country.

Subsequently an extraordinary meeting was held, when resolutions were passed authorising the directors, subject to the confirmation of another extraordinary meeting, to create £100,000 additional capital in preference shares of £5 each.

Replying to a question, the Chairman said the new capital would, in the first instance, be offered to the existing shareholders to the amount of their present holding.

Altrincham Electric Supply Company, Limited.—The balance-sheet shows a balance profit for the past year of £725. The company has several important contracts in hand.

City of London Electric Lighting Company.—The transfer books and register of holders of £400,000 5 per cent. debenture stock will be closed from 21st to 30th inst.

Electric and General Investment Company.—The transfer books will be closed from 13th to 28th inst., inclusive.

TRAFFIC RECEIPTS.

The Bristol Tramways and Carriage Company, Limited.—The receipts for the week ending June 10th, 1898, were £2,899 0s. 1d.; corresponding period, 1897, £3,365 1s. 5d.; decrease, £466 1s. 4d.

The City and South London Railway Company.—The receipts for the week ending June 12th, 1898, were £931; week ending June 13th, 1897, £880; increase, £51; total receipts for half-year, 1898, £24,558; corresponding period, 1897, £24,215; increase, £343.

The Dover Corporation Electric Tramways.—The receipts for the week ending June 11th, 1898, were £157 4s. 8d.; total receipts to June 11th, 1898, £2,698 15s. 9d.

The Dublin Southern District (Electric) Tramways Company.—The receipts for week ending Friday, June 10th, 1898, were £648 5s. 3d.; corresponding week last year, £920 8s.; decrease, £272 2s. 9d.; passengers carried, 97,778; corresponding week last year, 128,715; aggregate to date, £10,963 10s. 1d.; aggregate to date last year, £11,548 5s. 7d.; decrease to date, £584 15s. 6d.; mileage open, 8 miles.

The Liverpool Overhead Railway Company.—The receipts for the week ending June 12th, 1898, amounted to £1,482; corresponding week last year, £1,857; decrease, £375. 1897 includes Whit Monday.

The Western and Brazilian Telegraph Company, Limited.—The receipts for the week ending June 10th, 1898, after deducting 17 per cent. of the gross receipts payable to the London Platino-Brazilian Telegraph Company, Limited, were £2,850.

THE MUNICIPAL ELECTRICAL ASSOCIATION, 1898.

ON THE NECESSITY FOR UNIFORMITY IN PLANT AND APPARATUS.*

By C. H. Wordingham, Assoc.M.Inst.C.E., M.I.Mech.E., M.I.E.E., City Electrical Engineer, Manchester.

The principles enunciated by Dr. John Hopkinson in his classical paper, on the cost of electric supply,† are now fully appreciated by the majority of supply engineers, municipal and others, but it is doubtful whether they recognise that their own field of labour is but one very small, indeed, insignificant, plot in the wide area to which these principles apply.

Manufacturers of all engineering products have to face the same problem, viz.:—the production of articles, the cost of which is made up of two items, one independent of the quantity sold, the other practically proportional to that quantity.

In the case of manufacturers, the standing charges comprise the establishment of the works, *i.e.*, the cost of land, buildings, engine power, machinery and tools, drawing office staff, patterns, &c.; the establishment of offices, and in many cases of showrooms, with staff of clerks, travellers, &c.; the holding of a stock to supply the demand without delay; while to these standing expenses must be added the salaries of a number of engineers, managers, &c., who must be ready to design the articles manufactured, and who must be kept up to date in the latest practice, often at great cost.

The running expenses are wages for labour, skilled and unskilled, fuel, oil, &c., for running the works, repairs to machine and other tools, raw material.

Probably no better example of high cost could be taken than the manufacture of submarine cables. In this case both items are greatly exaggerated. A large amount of very expensive machinery occupying great space, and extensive buildings, has to be provided and kept in good order, to be used perhaps once in the year, and when it is required it frequently happens that the work is of an urgent nature, and manufacturing has to be kept going day and night for a few weeks, necessitating overtime and high rates of wages, together with excessive wear and tear of plant, while the cost is still further augmented by the fact that the cable is probably of a special size and design.

Now let us examine into the means by which the cost of manufacture may be reduced. Assuming that all that is possible has been done to economise by the choice of a site where land is cheap, by suppression of superfluous cost in the erection of buildings, by skilful design to avoid unnecessary handling of goods, by the absence of display in offices, &c., what remains to enable the manufacturer to reduce his costs? One thing pre-eminently, restriction of the number of types and sizes of the articles produced. To produce, say, a dynamo machine or an engine, a number of calculations have to be made, then a series of drawings must be prepared, next the patterns, and finally the tools. All this means large expense, and, if only one article is made, the whole cost has to be charged to that article, and this standing cost may completely swamp by comparison the cost for material and labour. Whereas, if a thousand such articles were required, the fixed cost, being divided amongst them all, would be only one-thousandth part of what it was in the case of one. By limiting the number of patterns, it becomes possible to devote more time and attention to perfecting the design and the tools necessary for the manufacture, hence higher efficiency is gained in conjunction with reduced costs, for, though the provision of the tools requires a slight addition to the standing cost, it is quite inappreciable when divided among the number of articles sold, and there is a corresponding saving effected in labour.

The subject as a whole is a very wide one, but this paper must necessarily be confined to the particular case of electric supply stations, and the author hopes to be able to show that, even limited to this small area, the question is of great importance.

At present, every engineer in designing a station, seems to think it incumbent upon him to have something different in his station to that in every other. One fixes upon some peculiar declared pressure, involving special designs for every lamp, motor, radiator, or other consuming device that is to be attached to the circuit. Another wants alternating current of special periodicity, or transformers of an unusual capacity, or in a case of some unheard-of shape. Another

* Read June 9th.

† See Dr. John Hopkinson's paper on "The Cost of Electric Supply," read before the Junior Engineering Society, on November 4th, 1892.

wants extra large boilers, or dynamos of a capacity different to any stock size. Another requires cables of a size necessitating strands of some odd gauge of wire. No doubt this is not wholly intentional, but arises partly from want of thought, partly from ignorance, and partly, it is to be feared, from a feeling that manufacturers are a kind of inferior race, who cannot possibly know as much as the engineer, and who must do as he tells them. Now, it is essential to success, both mechanically and financially, that the engineer and manufacturer should mutually strive to secure it; the manufacturer must endeavour to carry out the engineer's objects, and the engineer must subordinate the details of his scheme to the convenience of the manufacturer. No man can know everything thoroughly, and it must be admitted that a manufacturer, who devotes his whole time and energy to the production of a particular class of machinery or apparatus, must know more about that particular class than the engineer with whom it is but one item out of the many comprising his whole scheme. Only those men, whose standing in the profession is assured, dare to admit and recognise this, the second-rate men fear that their doing so will be construed into a confession of ignorance or incompetency.

As an evidence of the want of uniformity now existing, I have made inquiries as to the practice as regards certain points, and through the courtesy of the engineers running the stations, have obtained the following information. The particulars relate to 109 stations, in 46 of which continuous current is employed, in 55 alternating, and in eight both alternating and continuous.

First as regards declared pressure, the following table gives the number of stations and the various pressures declared:—

TABLE A.—DECLARED PRESSURES.

In addition to the above, a few stations give special pressures for special reasons. One station varies its pressure according as the transformer is made by one or other of two manufacturers. Another, which normally supplies at 100 volts, supplies at 102 by special arrangement with a "Lunatic Asylum." (!) A third supplies at 113 volts, but naively recommends 110-volt lamps. Apparently this station is not run on the same lines as those in which the declared pressure is "102½ volts."

Incidentally, it may be remarked that the permission given by the Board of Trade to vary the declared pressure in different districts is practically never taken advantage of, while as against this, one station, in defiance of all Board of Trade regulations, boldly declares a pressure of 420 volts.

The next point of importance in which the practice differs is the question of periodicity in alternating stations. The periodicities are set forth in the following table:—

TABLE B.—PERIODICITIES.

The size and pressure of the generators is the next point of interest. It did not appear worth while to tabulate the pressures generated in low pressure stations as the declared pressure is a sufficient indication of the pressures used. As regards the high pressure generators, however, the following table shows the pressures generated:—

TABLE C.—HIGH PRESSURES GENERATED.

The size of generator is very important, and here again there is a most extraordinary discrepancy in the sizes employed. These are tabulated in Table D. Without entering into the number of machines, which do not very greatly affect the question, the following sizes are in use:—

TABLE D.—SIZE OF GENERATING UNIT.

Inquiries as to whether standard sizes of mains, meters, &c., were employed, showed that in many instances such is not the case, the sizes being chosen haphazard according to requirements.

The above figures will serve to show the utterly chaotic state of central station practice as regards standardisation in this country at the present time, and very little consideration is necessary to show that the difficulties to be coped with by manufacturers in consequence must be enormous, and that, for the reasons stated at the beginning of this paper, the price of plant and apparatus to users must be very largely augmented, without there being any corresponding additional profit to manufacturers. The additional cost is in fact pure waste, and benefits nobody.

No doubt it is inevitable, in the early stages of any industry, that there should be great diversity of practice, indeed, it is desirable that things should not become stereotyped until the best has been discovered, but we have surely now arrived at a time when we can make up our minds on such subjects as those enumerated above, and it is of vital importance that the matter should be settled soon, for each new station that is to be built perpetuates its own set of quantities.

The most important point of all is the declared pressure, for this affects every consuming device as well as generators, or transformers if used. While it should be so fixed as to admit of as economical distribution as possible, it should not involve a loss to the consumer in wasteful resistance, or in enhanced price for lamps specially fragile or difficult to manufacture.

The author ventures to think that, taken all round, 100 volts and multiples thereof is the most convenient pressure, and the one most likely to meet with general acceptance. In the first place, it is that most largely used at the present time, and it meets the conditions named above, since two ordinary arc lamps, or one enclosed, can be made to burn steadily at 100 volts, the waste in resistance being reduced to a minimum, while for the first multiple, viz:—200 volts, there is little difficulty in obtaining single incandescent lamps. Moreover, it gives a convenient pressure across the outer conductors, a pressure suitable for tramway working, while allowing a good margin for loss on low pressure feeders, without necessitating a higher pressure at the generating station or transforming station, than 500 volts, which is the limit of low pressure fixed by the Board of Trade. Incidentally, 100 volts is very convenient for mental calculations, and for meters when ampere-hour instruments are employed.

In passing, it may be remarked that a good deal of doubt appears to exist as to the exact meaning of the Board of Trade definition of low pressure, viz., whether 500 volts is the limit at the station, or at the network end of the feeder, and an authoritative interpretation of this would be very acceptable.

Other directions in which standardisation is necessary may be mentioned here, viz, the adoption of standard candle-powers for incandescent lamps. It would appear that no more than four sizes below 100 candle-power are really necessary. A little consideration will show that, quite apart from the question of manufacture, the limiting of the number of sizes would enormously reduce the amount of stock that has to be held, and hence a large amount of capital uselessly locked up would be set free.

The number of sizes of arc lamps might very well be reduced. Three would suffice for all ordinary purposes. If this were done, not only would the cost of production be greatly lessened, but the ease of replacement of damaged and worn out parts, and the cheapening of carbons, together with convenience in obtaining them, would be a great gain.

As regards motors, it is probably not worth while to make anything smaller than 2 horse-power, whatever it is intended to drive, except perhaps in the case of ventilating fans. The bulk of the demand will probably be for motors under 25 horse-power, and three sizes between this and 2 horse-power should suffice.

So long as a supply of alternating current continues to be given to consumers, the question of periodicity will affect the stations concerned nearly as greatly as does the question of declared pressure, and it is therefore as important that some definite understanding should be come to. The variation at present, as will be seen from the table, is as great as or even greater than in the case of pressure.

The question of periodicity will always be an important one, as there can be little doubt that two or three-phase current will be generated in many stations in the future, though probably it will not be supplied to consumers.

Next in order of importance perhaps is the size of generating unit in the station. It was recently necessary for the author to go into this matter somewhat carefully, and he was astonished to find at what an early period in the development of a central station it becomes possible and safe to employ large units. There are practically four factors governing the choice of the unit of the plant. They are

(1) The initial capacity of the station.
(2) The probable ultimate capacity.
(3) The steps by which it is permissible to increase the capital expenditure.
(4) The percentage safe overload of the plant.

It may be mentioned here, that, in the author's opinion, it is preferable to have reserve plant in the shape of machines with considerable margin of possible overload beyond maximum economical load than in the form of spare machines, for the latter are only of use in cases of actual breakdown, while, in the former case, the reserve is always ready to be called into play at a moment's notice, and there is no delay due to having to start up another machine in case of sudden demand, whether from a running machine having to be switched out or from an abrupt change in weather. Further than this, the same amount of reserve can be attained more economically.

The conditions to be fulfilled then, are, that if any one machine break down, the remaining machine shall not be overloaded more than a definite amount, say, 33 per cent., 25 per cent., or 20 per cent. If the last-named figure be adopted, this means that the first installation of plant must consist of six machines of equal capacity; their size will depend on the initial capacity of the station. When extensions have to be made, the increment of plant will depend upon the increment of capital permissible. The condition that any one unit may break down without overloading the plant 20 per cent. allows of either one, two, or more machines being added. The amount of increase of capital will be a minimum if only one machine be put down, but this course is open to the serious objection that it means a number of machines all differing in size after the first six, hence absence of interchangeability of plant, and an unsightly station. It would appear most convenient to increase the plant by pairs of machines, since this gives a symmetrical arrangement, allows of reduction of spare parts, and renders the machines convenient multiples of one another. Time does not admit of a particular case being worked out, but if this be done, it will be seen that a large size is soon reached, and after a certain point the rule cannot be carried out, as it leads to engines of impracticable size. It then becomes necessary to add each time one or more machines of the same size. It would be a matter of great interest to learn from engine and dynamo builders what is the upper limit of size of generator.

It will thus be seen that we begin with six machines with parts interchangeable, and finish with a certain number of machines depending on the size of the station, also having the parts interchangeable, and between we have a number of machines of varying sizes. In very large stations put down on a sufficiently generous scale, all the units may be of the same size, but the author maintains that the initial number should not be less than that number which allows of one breaking down without overloading the remainder more than the specified amount, and it cannot be considered safe to put down one or two large machines to begin with, and to trust to good workmanship and design to avoid mishap.

On the above principles it should not be a difficult matter to work out a series of machines which will provide for stations of all ranks, and yet be limited in number.

Next may be considered the question of mains, both as regards the conductor and the insulation. It is greatly to be desired that only a few sizes of conductor should be decided upon. The author has endeavoured to show elsewhere* that of necessity the size of main required in a given street is largely a matter of guesswork, hence it should not be a difficult matter to agree upon standard sizes that may be such that they can be made up from ordinary S.W.G. wires. If this were done, a manufacturer could afford to stock a great deal of wire, and one source of delay in delivery would be avoided.

Again, it surely should be possible to settle upon standard tests for dielectrics of different kinds for given pressures, and if this were accomplished, manufacturers could stock cable actually ready for delivery. The advantage of this will be fully appreciated by central station engineers, for, instead of each one having to store for his own requirements, he would be able to order from stock, and save the expense of cable stores and their attendants, besides being able to meet unlooked for extensions at short notice, while the aggregate stock, and therefore the capital locked up, would be much less than if there were a number of separate stores.

We next come to accessories such as service cables, transformers (in the case of alternating supply), main fuses, meters, maximum recorders, meter boards, &c. Here again the cry must be standardise. Find out the best all round pattern of each, and keep to it. Have as few sizes as possible. Arrange your parts so that they shall come in if extensions take place so that the work may not have to be redone. In his own practice, the author has endeavoured to carry out these principles, and he has to a great extent succeeded, but it would be tedious to enter into the details.

It is of little use for one, or even many, individuals to standardise unless there be co-operation. It will probably be said, all admit that uniformity of plant is desirable, and you are but labouring to prove that which is evident. How do you propose that this desirable end should be achieved? The author replies that there is but one way, and that is by settling upon certain standards that will be acceptable to the majority of those concerned, and this can only be done by thrashing out the subject by a committee thoroughly representative of all classes interested.

This Association is representative of a section of one section only, viz, the Municipal section of users of plant, and it is not therefore competent to deal with the matter by itself. The Institution of Electrical Engineers, the mother of all British Electrical Societies and Associations, is the proper organisation to which the matter should be referred, and it will doubtless be a matter of satisfaction to the members of the Association to learn that our Council has already approached the Institution with a view to this, and a committee has been appointed by them to thoroughly go into the question.

The recommendations of the committee cannot fail to carry great weight, and, if the matter be properly taken up uniformity will soon be secured, for it will be found that the firms not making standard plant could not compete with those that did, and users with fads would find them too expensive to indulge.

It may be thought that such a system should be international, but it is to be feared that the difficulties of securing the desired end would be such as to make it impracticable, and it would result in the matter being indefinitely postponed.

In conclusion, the author trusts that the various points he has alluded to will be thoroughly discussed, and that some practical suggestions for the guidance of the committee referred to may be forthcoming.

APPROPRIATION OF PROFITS AND REPAYMENT OF LOANS.

By Bailie Wm. Maclay, Convener of Electricity Committee, Glasgow Corporation.

In every department of municipal work—however technical it may be—there always arises the question of finance. As the proverb has it, "Money makes the mare to go," and even an electricity committee must study ways and means. It would be a comparatively easy matter for a wealthy corporation to erect extensive buildings and put down an installation of the finest machinery and plant—it may be regardless of expense—but it is a different and a more difficult thing to generate current at a price that will commend its use to the majority of the community, either as an illuminant or a motor power, or both. An old friend of mine was at one time manager of the Home Farm, associated with one of the largest iron industries in this country. Many a time I wondered why he left the employment of that firm. I had it all explained to me one day by one of his contemporaries. Mr. Johnstone, he said, kept his farm in splendid order. Everything was done in the very best style, but he could not make it pay so he had to go. Fortunately for me, the subject of my paper does not compel me to deal with deficits—only with profits. As a rule profits can easily be disposed of. It is a fact, in the experience of most men that profits are more easily distributed than secured. But when a corporation does come to hold something like a monopoly, it ought to make profits, or perhaps I should rather say, ought to have a surplus every year. Those surpluses having been secured, the question naturally arises what is to be done with them. In the city of Glasgow we have no difficulty with that. We believe in letting "every herring hang by its own head." In other words, the Corporation allows each of our commercial departments to dispose of any surplus that may result from a successful year's business. We recognise the fact that not one of these depart-

* See his paper on "The Distribution of Electrical Energy," read before the Northern Society of Electrical Engineers, on November 8th, 1897.

ments exists to make profits—as is the case with a private commercial concern—but that rather it has been called into existence for the benefit of the community as a whole. This matter seems to be viewed rather differently in England, and had that not been the case, perhaps I should not have written this paper. Let us take Manchester as a typical example. At the end of their financial year they showed a surplus of £40,000 in the gas department, which was transferred to city fund account, presumably for the relief of taxation. Now it may be said that "it is as broad as it is long," and what is taken out of the one pocket is simply put into the other, the community being no poorer by the transfer. I am inclined to dispute that. Take, by way of illustration, our gas department, whose business is one of the largest of its kind in the three kingdoms. Annually we carbonise something like 600,000 tons of coal, and we supply gas to all consumers in the city of Glasgow, the important burghs of Govan, Partick, &c., and nearly every district within a radius of seven or eight miles from the centre of the city. Now let us suppose that every ratepayer uses our gas, but they all do not use this illuminant alike, and in an exact proportion to their rental, which is the basis of municipal assessment. Some of our people use gas only as an illuminant. Others, again, turn it to account in stoves for heating purposes as well as for lighting, whilst a third class use it not only for light and heat but also as a motor power. Having no differential charge in Glasgow, the large consumer would therefore pay away far more, probably, than he received back in the form of reduced taxation, whilst a small consumer might get a rebate of taxation out of keeping with his gas consumption, and that at the expense of the larger consumer. This is neither fair nor equitable, and would not be tolerated in our city. We contend that what has been taken from a gas consumer in excess of the cost of production and distribution should be given back to him at once and directly through the department in the form of a reduced charge in the immediate future. This meets all the wants of the case, and inflicts a hardship on no one.

But this is not my principal nor my strongest argument in favour of the Glasgow system of appropriation of profits. We hold that it is a sound policy to place as few restrictions on business as possible, especially in these days of keen competition. We maintain that if any of our commercial departments, originated solely for the good of the people as a whole, is compelled to keep the price of anything above the cost of production and distribution, then a restriction, an artificial and arbitrary restriction is placed upon the business of that committee. Is it fair or just to that particular committee? Is it fair or encouraging to the engineer or superintendent who is largely responsible for the prosperity of the undertaking? I say that it is not, and that every committee should in this respect be unfettered. It is true that it is very creditable to the gas department of Manchester that they should be able to supply gas at a moderate price, and at the same time hand over £40,000 annually to the city fund. We, in Glasgow, think that it is at least as creditable to supply gas to the community at, perhaps, as low a price as obtains in the three kingdoms, although we should not give a farthing to the city fund for the relief of taxation. Further, our Electricity Committee have faith in the proposition that by reducing the price of current they will increase the demand, and an increased demand will enable them to reduce the price still further, until it reaches the irreducible minimum. The two things are closely associated, and in fact, co-related. You cannot well have the one without the other. That leads us to the conclusion that every department—and especially the electrical department—ought to have a free hand in this respect, in order to demonstrate to the public that it is doing its best to provide, and provide successfully, for the wants of the people, and the best evidence of this is to be found in a low charge for current rather than in a continuous large surplus to be appropriated by other departments at the end of each year. Last year, on a turnover of £30,000, our Electricity Committee had a profit of £18,000. When disposing of this surplus, we first of all set aside £2,770 as an extra depreciation on the John Street and Miller Street stations, where the plant and machinery were old and somewhat obsolete, having been acquired from a private firm, when we received our provisional order. Next, we debited £1,500 against renewals on meters, and £1,000 for probable renewals of ordinary plant and machinery in the Waterloo Street station. We further appropriated about £5,500 of our large surplus for ordinary depreciation on our buildings, plant, and machinery, mains and cables, making in all £10,705 10s. for depreciation and renewals in our stations. The balance of our surplus of £18,000, amounting to £7,293, we disposed of as follows:—A sum of £4,300 was absorbed by interest on capital, £1,466 was placed to the credit of the sinking fund. This left a net balance of £1,527, which was carried forward to the credit of next year's account. This, gentlemen, is how we dispose of a surplus in Glasgow. Every penny of it was appropriated for the good of this department, and this department only, and we maintain that the citizens benefited quite as much as if the bulk of it had been devoted to the relief of our municipal taxation.

I now come to speak of the other branch of my subject—"the repayment of loans." It would take up too much of your valuable time were I to examine and compare the indebtedness of Glasgow with the obligations of other municipalities, or enlarge on their various systems of repayment. It may suffice that I treat of the indebtedness of our own municipality and of our sinking funds, allowing each of you to make his own comparisons and draw his own conclusions. In order to make my figures exact and complete, I shall deal with the year ending May 31st, 1897, being the latest financial year of the Corporation of Glasgow. At that date the liabilities of our Corporation, including gas and water annuities, and the debt of the common good department, amounted to £8,748,652, and our assets to £11,596,384, thus showing a clear balance in favour of the municipality to the extent of £2,847,732.

But having stated the amount of our indebtedness, the question naturally arises: How are these liabilities to be discharged? Let me say, before I proceed further, that all our money for departmental purposes is borrowed through the loans fund, at the head of which is an excellent financier. This is a useful institution, which unites and keeps in touch all the departments of the Corporation. Should any committee have more money than they can profitably use, they lend it to the loans fund, whereupon the loans department either pays off debt or lends the amount to some other department of the Corporation. In this way, we never have to go outside to seek for investments. Temporary loans on revenue account must be repaid within a reasonable time, and out of the revenue of the year in which they were borrowed. If any one of our departments promotes new undertakings requiring further capital expenditure, then its borrowing powers must be increased by Act of Parliament, and the money secured from the investing public by an issue of stock or otherwise. In the case of a temporary loan, the lending committee is credited with the current rate of interest, whilst the borrowing committee is debited with the average rate payable on the loans.

Our debts we liquidate in the customary way, by means of the sale of property, and the sinking fund and the rates vary according to the nature and character of each respective undertaking. At May 31st, 1897, our police department was still owing £1,549,254, but the sinking funds being all calculated on the maximum amount originally borrowed, this sum will be quickly reduced, and finally disappear altogether.

Under the heading of police department we include the following: Public health and permanent paviour work, the sinking fund for which is at the rate of 5 per cent. The rate for sewage purification works is fixed at 1⅝ per cent. For general police purposes, sewer construction, and street improvements purposes it is 2½ per cent, whilst for rebuilding of bridges and payment of county road debts the rate stands at 2 per cent. In 48 or 49 years after to-day this large debt will be extinguished altogether. Many of us in Glasgow will not live to see this "consummation devoutly to be wished," but whilst the individual citizen dies, the corporation lives on and flourishes in perennial youth.

In our water supply department, the balance of loan debt unpaid stood at £2,784,148 in 1897. At the departmental minimum rate of sinking fund 1½ per cent., this balance will be absolutely wiped out in 66 years hence. It is true that we are contracting new and large obligations, but we must leave something to be paid by posterity, as they will inherit from us, perhaps, the finest water supply in the kingdom.

I shall now say a word about the gas and electricity departments. Our electricity committee was a sub-committee of the gas committee until the November before last. It was then created a separate and independent committee unless in the matter of finance. We shall therefore have to treat the indebtedness and the sinking funds of the two as one joint obligation. In 1897, the joint indebtedness might be taken to represent £1,127,495.

These I have enumerated are the heaviest liabilities of the Corporation, and I think I need not go further into detail. The markets department, with its sinking fund and—in its case—surplus profits, should extinguish its present debt in 28 years, which is something like 3 per cent. per annum overhead. The parks and galleries departments and the municipal buildings have a minimum rate of 1 per cent. with accumulations for their sinking funds. The parks debt will be repaid in 49 years and the municipal buildings in 56 years. The city improvement's department has a loan debt of £1,246,256. The debt is reduced by sales of property and surplus income. The sinking fund does not come into operation till the last property is sold, and our tramways pay off their obligation of £516,556 by a sinking fund at the rate of 2 per cent., which if accumulated at 3 per cent. will pay off the debt in 30 years.

I have thus given you the particulars of the manner in which we repay our loans. The system seems to have commended itself to our fellow-citizens, and our finance has been approved by capitalists all over the kingdom. Were evidence of this wanting, it must be found in the very low rate of interest we pay on our loans. On our last issue of stock it is only 2½ per cent., and on our temporary loans the average rate is as low as £1 11s. 9d., whilst our promissory notes have been readily taken up by London financiers at even 1½ per cent. and 1 per cent.

Gentlemen, our motto of old was "Let Glasgow flourish by the preaching of the Word." To-day Glasgow flourishes also by the low rate of interest on capital expenditure.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

THE DESIGN OF ELECTRIC RAILWAY MOTORS FOR RAPID ACCELERATION. By Prof. CHARLES A. CARUS-WILSON, Member. Read May 26th, 1898.

(*Concluded from page 827.*)

IF single-reduction gearing is used, the largest ratio of *v to d* is limited by the number of teeth in the pinion for a driving wheel of given diameter. For example, let us take a driving wheel 33 inches in diameter. If the clearance between the casing of the gear wheel and the level of the rail is limited to 4⅝ths of an inch, we cannot get more than 67 teeth in the gear wheel. If the least number of teeth in the pinion is 14, the velocity ratio is limited to 4·78, and the ratio of *v* to *d* is limited to 0·145. These dimensions and numbers are taken from the standard street railway equipment made by the General Electric Company.

In our example, if the driving wheels were 33 inches in diameter, the velocity ratio required to get the best results would be 7·15. This would be impossible with single-reduction spur gearing. We should therefore have to use a smaller value of v than the best.

If the series-parallel controller is used, the maximum current from the line at the moment of starting is reduced by one-half. Since the current per motor is the same as with the parallel controller, the acceleration will be unaltered. The motors can be held in series until the speed is 5·7 f.p.s.; the result then is to reduce very nearly by one-half the expenditure of energy due to heat. In estimating the energy required to cover any distance, we may generally assume that the effect of series-parallel control is to halve the heat lost.

As an illustration of the application of these principles to the heavier class of railway work we may take the Metropolitan Elevated Railroad of Chicago. Particulars of this railway have been given by Mr. M. H. Gerry, and may be found in a paper published in the *Proceedings of the American Institute of Electrical Engineers* for 1897.

The rolling stock consists of motor cars and passenger cars. The former measure 47 feet in length, and weigh 62,000 lbs. when fully loaded. They are mounted on locomotive trucks, with driving wheels 33 inches in diameter, the velocity ratio being 3·18. One truck of each motor car is equipped with two motors.

The passenger cars are 47 feet in length, having trucks fitted with 30-inch wheels, and weigh 46,000 lbs. when fully loaded. Trains of two, three, and four cars are made up according to the demands of the traffic at different hours. We shall consider a train of one motor car and three passenger cars, weighing in all 90 tons. We shall take the case of two stations separated by a distance of 2,500 feet of level track, and consider first the effect of the period during which the brakes are being put on.

If the distance covered during the period of retardation bears to the time occupied the same ratio as the whole distance to the whole time, *i.e.*, if the mean speed during retardation is equal to the schedule speed—the value of $\frac{M v}{d}$ will be independent of the time during which the brakes are on. For this quantity depends only on the ratio of t to D, and by our supposition this is unaltered by the length of the retardation period. The final speed will therefore be unaltered, and hence the energy expended in accelerating will be independent of the rapidity of stopping.

Again, the accelerating current varies as $\frac{D^2}{t^3}$, hence it will decrease as t increases; *i.e.*, the accelerating current will decrease with the time occupied in braking. But the work done in heating will be nearly the same, since c_a constitutes by far the greater proportion of the whole starting current.

The energy spent in overcoming friction, however, will increase with the distance during which the motors are working, but the amount of increase will generally be a small proportion of the whole energy thus spent. If, then, the mean speed of retardation is equal to the schedule speed, we may determine the time occupied and the distance covered during the retardation period simply with reference to the ability of the brakes to stop the train. In the case before us we shall allow 20 seconds and 500 feet for retardation, leaving 2,000 feet to be covered in 80 seconds.

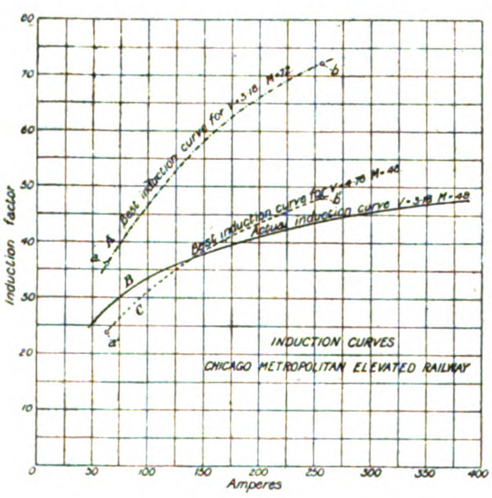

FIG. 9.

The tension of the line is 500 volts. If the drop at full speed is imited to 5 volts, we find from equation 15 that $\frac{M v}{d}$ must be 3·46. If we adopt the existing values of v and d, we get M = 35·9.

From the results of tests made on this line, the retarding forces at 15 miles an hour, including gear friction, amount to 13·6 lbs. per ton of load, or 614 lbs. horizontally per motor. Hence the current at full speed will be 63 amperes, and each motor must have a resistance of 0·0795 ohm. The train resistance, excluding gear losses, amounted to 450 lbs. per motor.

We have thus found one point on the induction curve, namely, M = 35·9 for 63 amperes. In fig. 9 horizontal ordinates represent current, and vertical ordinates values of M. Take a point, a, giving = 35·9 for 63 amperes.

The accelerating current is found from equation 16 to be 226 amperes. If the induction factor at the start is twice that at full speed, the current then required for friction is only 31·5 amperes, so that the total current at starting must be 257 amperes, and the corresponding induction factor 72. This gives us a second point on the induction curve, and is plotted at b in the figure. We shall suppose that A is the best curve that can be obtained passing through the given points.

The diagrams of current and acceleration with motors having A as their induction curve are given in figs. 10 and 11, and are drawn in full lines. The time taken to cover 2,000 feet is 78 seconds, the saving of two seconds being due to the series winding. Full speed is 37·3 f.p.s., but is not reached, the highest speed being 33·5 f.p.s., or 23·6 miles an hour. The initial acceleration is 1·27 f.p.s. per second.

The induction curve for the motors actually used is given at B in fig. 9, and the curves of acceleration and current for these motors are shown in figs. 10 and 11 by dotted lines. The brakes were applied at the end of 77 seconds, when 1,930 feet had been covered; and the

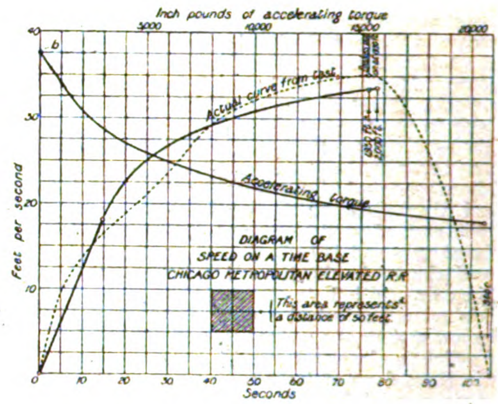

FIG. 10.

remaining distance of 570 feet, making up the total of 2,500 feet, was covered in 27 seconds, making the whole time 104 seconds.

The irregularities in the current-curve are the result of the uneven handling of the controller. The motors take 380 amperes each at the moment of starting, and are allowed to speed up in series for 10 seconds, after the starting rheostat is all out. When thrown into parallel the current per motor is 330 amperes, or 660 from the line. More careful manipulation of the controller would have effected a better start.

We have already seen that the force of a motor may be conveniently expressed as the product of the current and the corresponding induction factor. Since the ordinates in a diagram giving the induction curve represent current and induction factor, a curve of equal force is a hyperbola. In fig. 9 the point b represents an induction factor of 72 for a current of 257 amperes; in other words, the force factor required to start up with an acceleration of 1·27 f.p.s. per second is 18·5 kilodynes. If we draw a hyperbola through the point b, it will cut the induction curve B at a point giving the current that the motors in actual use must take in order to get an acceleration of 1·27 f.p.s. per second. The current thus found is 390 amperes. An inspection of the acceleration curves in fig. 10 shows that the acceleration obtained in the test is rather greater than that obtained by calculation, while the current is 380 amperes. The experimental curve, however, is somewhat irregular, and the agreement is as close as might be expected.

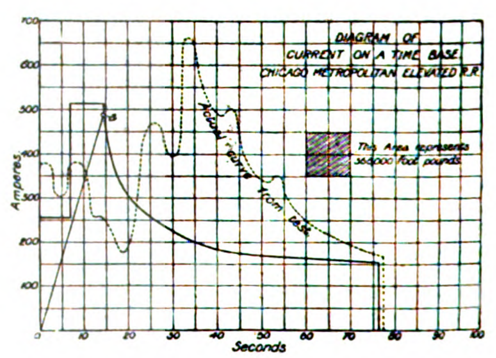

FIG. 11.

The effect of the form of the induction curve B on the current-curve is clearly shown in fig. 11. The maximum current from the line is 28 per cent., and the maximum current per motor 48 per cent., greater than it need be, while the expenditure of energy in the form of heat is 4·6 times what it would be if curve A had been used.

The force factor required to drive the train at full speed is given by the product of 63 and 35·9, namely, 2·26 kilodynes. If we draw a hyperbola through the point a in fig. 9, it will cut curve B at a point giving the current taken by the actual motors when running at full speed, and it will also give us their maximum speed. This will be nearly inversely proportional to the minimum induction factor, and we see that it will be nearly 45 f.p.s., or 30·6 miles an hour.

It does not follow that the highest speeds actually attained in the two cases will be in the ratio of the minimum induction factors, because the maximum speed is not reached, but we see that the expenditure of energy in acceleration will be greater with the lower induction curve. The values for the kinetic energy in the two cases are 380×10^4, and 350×10^4 foot-pounds. The following table gives the expenditure of energy, expressed in foot-pounds, for a distance of 1,930 feet:—

	Total energy. From test.	Total energy. Calculated.
For acceleration	380×10^4	350×10^4
For train resistance*	174×10^4	174×10^4
For gear loss, at 85 per cent. mechanical efficiency ...	98×10^4	92×10^4
For C^2 R loss	311×10^4†	67×10^4
	963×10^4	683×10^4

* 900 × 1,930.

† Obtained by deducting the previous amounts from the total expenditure, as ound by integrating the current-curve.

The greatest induction factor in the motors actually used is 48. If we take this as the limiting value of M, we see that we must increase the velocity ratio in the proportion of 48 to 72 to get the best results. In fig. 9, curve C has been obtained by taking each vertical ordinate this proportion of the corresponding ordinate of curve A. If, then, we make the motors with this induction curve, they will work with the same economy as those with curve A, provided that the velocity ratio is increased in the proportion of 48 to 72—*i.e.*, from 3·18 to 4·78.

We are thus able to make a clearer comparison between the two motors. The new curve crosses the actual induction curve, but gives higher values of M for large currents and lower values for small currents. The changes that would have to be made to give the best results are: First, the velocity ratio should be increased from 3·18 to 4·78; second, the air-gap should be increased in width so that the induction curve may pass through the point a'; third, the section of the iron in the magnetic circuit should be increased so that the curve may pass through the point b'.

The economy of working under these conditions may be expressed best in terms of the work done per ton-mile, the distance, of course, including that during which the brakes are on. The energy expended may be conveniently stated in watt-hours.

Thus, in the example we have been considering, the economy attainable with induction curve C is 60·5 watt-hours per ton-mile. We here assume that the velocity ratio is limited to 4·78. With a maximum induction factor of 48 the highest possible economy is obtained with a velocity ratio of 9·75; the heat loss is then reduced to 17×10^4 foot-pounds, and the economy becomes 56 watt-hours per ton-mile. An equally good result could be attained with a maximum M of 72 and a velocity ratio of 6·50. The economy actually obtained with curve B is 85·1 watt-hours per ton-mile.

We may here inquire what would be the economy if the specification had insisted on a gearless equipment. To get the highest economy—*i.e.*, 56 watt-hours per ton-mile—the product $M v$ must be 468 for driving wheels 33 inches in diameter. If $v = 1$, the induction factor must be 468—a value much beyond the practical limit. To comply with the conditions as to time and distance, the minimum induction factor would have to be 114; if we take the maximum induction factor twice this value, we get the maximum M equal to 228, and a heat loss of 72×10^4 foot-pounds.

Since we have now dispensed with gearing, we can reduce the item in the table of energy expenditure due to gear loss. Assuming 95 per cent. mechanical efficiency, this becomes 31×10^4 foot-pounds; hence the economy is 55·5 watt-hours per ton-mile, the current for maximum and minimum induction factors remaining the same.

It is, however, unusual to find the maximum induction factor twice the minimum induction factor in motors of this size; a ratio of 1·5 to 1 is more usual. If we take 171 as the maximum value of M, the heat loss is increased from 72×10^4 to 162×10^4 foot-pounds, and the economy of working is 63·4 watt-hours per ton-mile. Thus with geared motors the expenditure of energy is about 5 per cent. less than with gearless motors of four times the weight.

The expenditure of energy per ton-mile may be reduced if the track, instead of being level throughout the whole distance, is provided with down grades at the station exits.

The best results would be attained if the train could actually start on the down grade. This, however, is impracticable; but the train should be brought to a standstill as near the top of the grade as possible in order to get the full advantage of the grade.

Let us suppose that the centre of gravity of the train moves through 150 feet before coming to the top of the grade, and that the force of gravity acts on the whole train throughout the length of the grade, which we shall take to be 300 feet with a fall of 9 feet.

The energy due to the train falling through a vertical distance of 9 feet is 181×10^4 foot-pounds; but this does not represent the gain due to the grade, for the final speed has been increased from 33·5 to 35·5 feet per second, giving an increased expenditure for kinetic energy of 43×10^4 foot-pounds: the difference represents the benefit due to the grade, and is 138×10^4 foot-pounds. With this arrangement there is a gain of about 6 seconds in the time of covering 1,930 feet. We might, then, have taken a larger value of t in our original calculations, relying on the gain in time due to the grade to reduce the time to that specified.

If, then, we take 82 instead of 76 seconds for a distance of 1,930 feet, the kinetic energy would be reduced to 162×10^4 foot-pounds, the C^2 R loss to 47×10^4 foot-pounds, and the gear loss to 60×10^4 foot-pounds; giving a total of 466×10^4 foot-pounds, and an economy of 39·4 watt-hours per ton-mile. The grade thus effects a saving of about 33 per cent. of energy with the geared motor, but only 28 per cent. with the gearless motor.

The results are summarised in the following table. The energy expended is expressed in terms of a unit of 10,000 foot-pounds. The distance is 1,930 feet throughout, and the weight of the train is 90 tons. In each case we suppose that the minimum value of M is the best possible—*i.e.*, that the expenditure of energy in accelerating is a minimum.

Track:	Level.	Level.	Level.	Level.	8 ? Grade.	8 ? Grade.
Maximum M	48	72	468	171	48	171
Velocity ratio	4·78	6·48	1	1	4·78	1
Kinetic energy	350	350	350	350	162	162
Train resistance ...	174	174	174	174	174	174
Torque loss	92	92	31	31	60	18
C^2 R loss	67	17	17	162	47	162
Total energy	683	633	572	717	443	516
Watt-hours per ton-mile	60·5	56·0	50·6	63·4	39·4	45·6

PHYSICAL SOCIETY.

Ordinary Meeting, June 10th, 1898.

Mr. Shelford Bidwell, President, in the Chair.

Dr. S. P. Thompson described and exhibited a model illustrating Max Meyer's theory of Audition.

Max Meyer abandons the audition theory of Helmholtz, and contends that analysis takes place in the ear otherwise than by resonance of the Corti organ. Imagine a jointed system, like a hand, to be oscillated from one end, *i.e.*, from the finger-tips. A small motion affects only the top joints, but a large motion affects the whole structure. Such a structure is the membrane of the inner ear. It widens towards one end, and is effectively damped by the contained liquid. Wave motions of different amplitudes run along it to different distances before they are extinguished; these distances are recorded by nerves, and are thereby communicated to the Corti organ. In the model, the compound wave to be analysed is cut out on the edge of a disc of zinc, so that, as the disc revolves, the motions are communicated to a framework. If the frame is thus moved through more than a certain distance, a displacement occurs which sets a second frame in motion, and so on to a third and fourth. The depth to which the motion penetrates is indicated by a series of glow lamps connected electrically to the frames.

Prof. Ayrton said it had for some time past occurred to him, when considering the way in which an expert telegraph clerk reads siphon-recorder signals on a long cable, that it might be possible to analyse waves without the supposition of a resonating apparatus. The clerk interprets not so much the motions to one side or other of the zero line, as the rate of change of velocity, *i.e.*, the acceleration of the siphon. This had been recognised in the design of those relays for long cables, where the lever makes contact when the received current exceeds a certain value, and breaks contact when the current falls below a certain minimum. Messrs. Siemens had adopted a relay in which the lever was carried on the suspended coil of a D'Arsonval galvanometer by a pivot with a small amount of friction. If contact was made, the coil could, nevertheless, continue in a given direction. If that direction altered, contact was immediately broken, and the lever passed over to the opposite stop, thereby reversing the local circuit. It was possible that, in the process of hearing, something akin to this took place, the ear behaving as a mechanism responsive, not by resonance to the complete waves, but by its sensitiveness to changes of direction of the received impulses.

Dr. S. P. Thompson thought that a mechanism similar to the relay described by Prof. Ayrton was contained in the telautograph of Elisha Gray; it was a "Prony" mechanism. In the acoustical problem the ear was probably sensitive to abrupt changes of shape in the waves as well as to reversals. In the case of mistuned octaves, something is heard that suggests "revolving" in the ear, indicating a cyclic change. In this regard, it was necessary to take into account the phase relations as well as the relative intensities of the component tones.

Mr. E. H. Barton then read a paper on the "Attenuation of Electric Waves Along a Line of Negligible Leakage."

It forms a sequel to a paper communicated to the Physical Society and printed in their *Proceedings* of December, 1897, and January, 1898. Shortly after the publication of the earlier results, Mr. Oliver Heaviside drew attention to Lord Rayleigh's high frequency formula for the "effective resistance" of wires to alternating currents, and suggested that the formula might be approximately applicable to the case; but he thought the experimental value of the attenuation would be considerably higher than the one derived from calculations. Mr. Barton here repeats the work, with special precautions as to the mode of insulating the parallel copper wires through which the wave-train proceeds. The value of the attenuation constant deduced from these experiments is 0·000013. By applying Lord Rayleigh's formula for the effective resistance of the circuit, and using this value in Mr. Heaviside's expression for the attenuation, the calculated constant is 0·0000062. To account for the discrepancy, the author points out that the effective resistance formula was originally developed for a wire placed at a considerable distance from other parts of the circuit, and for currents following the harmonic law. Whereas, in the experiments, the conditions are (1), wires 1·5 mm. diameter, only

8 cm. apart; and (2), the waves are propagated in the form of a damped train, with the large end leading; they are extinguished after ten or a dozen vibrations.

Mr. Oliver Heaviside (communicated) pointed out that, as there was human interest in error, it might be worth mentioning that at first it was supposed the previous experiments of Dr. Barton made the index of the alternation factor to be six times that of the long-wave theory for simple periodic waves. And it was hard to account for so large a discrepancy. The discovery of an error in the figures reduced the result from six to two. The small depth of the surface-layer of effective conduction, and the distance apart of the wires, seemed now to make it improbable that Dr. Barton's first reason, (1), was adequate to account for the doubling of resistances. The second, (2), was, of course, a substantial reason for increased resistance. A third one, Mr. Heaviside suggested, was the external resistance at the boundary of the waves. A combination of the second and third reasons, with a little of the first, might account for most of the extra attenuations observed, and, if more was wanted, one could "*try the K R law.*"

Mr. Appleyard said it was rather to be regretted that in all the experiments the distance between the wires had been the same, *i.e.*, 8 cms. By taking a few different values, (1) might have been checked. Lord Rayleigh's formula for the effective-resistance, involved the square root of the magnetic permeability of the wires. The author had, throughout, used copper, a paramagnetic metal, and had assumed $\mu = 1$. It would be of advantage to try other metals.

Mr. Barton, in reply, said he would make further experiments with the two conductors at different distances apart, and he would also try iron wires. With iron, the thickness of the surface-layer of the effective conductor was about one-thirteenth that of copper. Iron should therefore give a greater value of the attenuation than copper.

LEGAL.

The New Motive Power Syndicate.

Testing Guittari's Patent.

Mr. Justice Bigham and a common jury had before them on Thursday and Friday, the 9th and 10th inst., in the Queen's Bench Division, an action brought by Sir Samuel Canning and Mr. Tom E. Gatehouse, consulting engineers, against the New Motive Power Syndicate, Limited, in which it was sought to recover 75 guineas, balance of account for tests, and a report upon Guittari's patent mixture for generating steam in boilers, and which ultimately resulted in a verdict for plaintiffs for the full amount. Defendants counter-claimed for damage alleged to have occurred to their boilers.

The counsel engaged in the case were:—For plaintiffs, Mr. McCall, Q.C., Mr. Macaskie, and Mr. Howard Spensley (instructed by Mr. J. E. Lickfold); for defendants, Mr. Tindal Atkinson, Q.C., and Mr. A. B. Shaw (instructed by Messrs. Robinson & Stannard).

Mr. McCall, in opening the case, stated that the plaintiffs were requested by defendants, who were interested in a certain patent, to test and report upon it. They did so, and now said that they were entitled to the sum claimed, which was the balance due to them. The main question to be decided was, whether or not plaintiffs had carried out the work they were employed to do. The substance of the patent was that by a mixture of carbonic acid gas and Dutch liquid with water in a boiler, Mr. Guittari claimed the motive power would be increased, and steam would be generated more rapidly, besides which there would be an enormous saving of fuel. Defendants, who were interested in the invention, were anxious to obtain a report from a firm of leading engineers like the plaintiffs, with the ultimate object of placing it before the public. Therefore on July 23rd last year. Mr. Bale, one of the directors of the defendant syndicate, wrote to Sir Samuel Canning on the subject of tests, and the fee for that and the report thereon was fixed at 150 guineas, half of which was paid at the time the arrangement was entered into. The tests took place on July 29th and August 2nd and 4th last year at the defendant's works, when an engine was supplied with steam from two boilers all constructed by Messrs. Davey, Paxman & Co. On August 2nd, one boiler was supplied with Guittari's patent, and on the 4th the other with pure water. The results were taken, and would be put before the Court. The substance of the tests was that Mr. Gatehouse and the other seven or eight gentlemen present with him, who constituted his staff, came to the conclusion that the results obtained from Guittari's mixture were no better than those obtained from plain water, and plaintiffs reported accordingly. Mr. Bale objected to the way the tests had been carried out, and then refused to accept the report or to pay the money due.

Mr. T. E. Gatehouse, A.M.I.C.E., M.I.M.E., Editor of the Electrical Review, &c., Mr. W. H. Booth, Member American Soc. C.E., a former inspector of the Manchester Steam Users Association, Sir Samuel Canning, M.I.C.E., Mr. J. Christie, engineer to the Brixton Electric Lighting Station, and a certificated chief-engineer of the Mercantile Marine, Mr. Webster, for some time chief draughtsman and assistant to Mr. Bryan Donkin, and Mr. W. H. Massey, engineer to Her Majesty the Queen, who had also made tests, were then examined at considerable length, and tabulated statements showing the results of the tests were put into Court.

Mr. Tindal Atkinson, in addressing the jury for the defendants, said Guittari's patent consisted of a secret mixture which made the water extremely volatile, so that it gave off steam with a much less consumption of fuel than would be required by plain water. Plaintiffs were duly consulted as to proposed experiments, which should have consisted of a series of practical and exhaustive trials before the practical utility of the process was arrived at. Upon a previous report made by the plaintiffs to another gentleman, a syndicate was formed, and £1,500 was subscribed by them for the purpose of carrying into effect, and rendering the process a popular success. Before they asked the public to subscribe, they were very anxious to be satisfied beyond all possibility of doubt of its actual value. They were entitled to have the very best information, through the means of exhaustive trials, which Sir Samuel Canning had assured them would occupy at least 10 days. Instead of that, only two days were occupied in the trials, which were unfair in every respect, and hence the present action.

Mr. A. J. Bale, one of the directors in the defendant syndicate, was then called, and he bore out the statement of Mr. Tindal Atkinson. The plaintiffs agreed, he said, to make the trials in such a manner as to test the points included in a previous trial of Guittari's patented process made by the syndicate's consulting engineer, and they did not do so. Moreover, the stoker provided by plaintiffs was not competent, and the firing was inefficiently done.

In cross-examination, Witness was asked whether there were any letters, from the beginning to the end, in which defendants said that the tests were not sufficiently prolonged.

His Lordship: It is quite clear that there are none.

Witness said he made a protest against the way in which the whole thing was done. He admitted that he saw nothing wrong in the stoking by Guittari personally. He did not take the trouble to see whether the proper weight of coal was supplied during the tests.

What do you say about the blower being used. Supposing the atmospheric conditions on August 4th were worse than on the 2nd, do you say they ought not to be allowed to use artificial draught in order to equalise the conditions?—It would be quite contrary to anything that I required. They ought to have reduced the load under which the engine was running.

Where is Mr. Guittari now?—He is on the Continent.

Was he asked to come and assist this syndicate?—Yes.

And he declined to come?—Yes.

His Lordship: He is behaving badly to you, then?—I daresay he is.

Another Mr. Bale was called next, and having said that he bore no relationship to the last witness, stated that he was an engineer of 28 years' experience. With regard to the tests, he admitted he was not present, but from what had come to his knowledge he would say that if they were making tests with chemicals or with the water only, and the arrangement was that they should be carried out under identically the same conditions, they should have been so carried out. He had been on trials with engines and boilers for the Royal Navy, and in no case were they allowed to use forced draught when the test was with natural draught. In the present case he should say that these were not proper tests.

His Lordship: Supposing you wanted to get the tests done as soon as possible, would it be reasonable to use the blower and get the draught similar to the natural draught?—I might if I was requested to do it, but I should not consider it fair.

Cross-examined by Mr. McCall, Witness said he did not know that the consumption of coal on the day when the blower was not used, and on the day it was, was almost identically the same.

Mr. John Humes, consulting engineer to the syndicate, said he was present at the tests, and on one of the days the stoker got his fire in such a bad condition that he ran away. Then Guittari himself stoked. Witness had known cases where boilers were seriously injured by the use of the blower. The intense heat produced by a larger volume of air being drawn into the fire was more like a blow-pipe action than anything else.

His Lordship: But the blower is a very common thing, is it not?—Yes, if used with discretion, but in this case it was not. To show what an intense heat there was in the boiler I may say that for 12 feet the iron chimney must have been very nearly red hot, for it was all scaled, and the expansion through the heat of the chimney broke one of the stays. At the end of the test in this case the plaintiffs left the boiler and I went and opened the fire-door and saw the water streaming down, with very little fire in the box, and nearly all clinker. I should say that the value of the boiler after the test was depreciated quite £25.

Cross-examined by Mr. McCall, Witness said he considered the use of the blower had very little effect on the consumption of coal.

His Lordship: Has the syndicate sold this process yet?—No, I believe not.

Have they had any other experiments made except that which was made by plaintiffs?—No.

So you cannot say at present whether the process is worth anything or not?—No.

Mr. McCall, in replying upon the evidence, said that what the syndicate desired was a good report, and they could not get it. They wanted one which would have enabled them to pass off to the public the invention which they had bought from Guittari. Finding they could not obtain it, they immediately found fault, and objected to what they had practically ordered, and had honestly been given them. They had transferred the process from one syndicate to another—what for, the learned counsel admitted that he could not say—and Mr. Bale and his co-adventurers again started with the matter. Plaintiffs could not conscientiously give a report to the effect that Guittari's patent showed a great saving. Guittari had now gone away, preferring Belgium to this country, and would not now assist the syndicate. The process was one which they could not sell, could not use, and could not get a report proving the alleged value of it, and were therefore anxious to avoid paying plaintiffs their fee. Had the report pointed out that the process was of advantage, defendants would not have resisted payment, but on the contrary, a big company might have been floated by this time, and the members of the syndicate would have put into their pockets a considerable sum of money.

In summing up, his Lordship said the question the jury had to decide in this case was whether the plaintiffs, who were suing for certain money promised for certain services, did their work in a proper and conscientious manner. If they did, they were entitled to be paid the balance; while if they did not they would not be entitled to it, but, on the other hand, would be bound to refund the 75 guineas which had already been handed to them. If a skilled person was employed to do a job he must do it with the skill which a person in his particular business would be expected to do it. If anyone employed a doctor to cure one of a disease, the doctor must bring, in the discharge of his duty, the skill which was expected, not of an ordinary layman, but of a doctor. Just in the same way when a civil engineer had to conduct a test or an experiment, he must do it with such skill as a civil engineer was supposed to have, and not with the skill only of a more ordinary individual who could not deal with it. Therefore, the question here, and the only question, was, did the plaintiffs bring to bear upon the tests of August 2nd and 4th the skill which the defendants had a right to expect from them. Defendants complained that such skill had not been brought to bear. When work was done and the person for whom it was done refused to pay for it, alleging that it was not done in the way he was entitled to expect, it was always as well to look at all the circumstances to see whether there was any other motive likely to influence him to make complaints. Some people, after having ordered a thing to be made for them, did not like the thing—not because it was badly made, but they did not like it, and found all sorts of excuses. Now the jury had better consider what, in this case, the plaintiffs wanted, and whether they liked it when they got it. The defendants were the New Motive Power Syndicate, Limited, and had apparently bought the process of Mr. Guittari, whom they had not seen in Court during the hearing of the case. It was described as a process by which, if one mixed with water a mysterious compound, and then put it in a boiler, much better results could be obtained than with water only. A syndicate, which he would call No. 1 syndicate, bought the process, and raised amongst themselves £4,000, with the object of making certain tests to see whether the mixture was really worth what was claimed of it. That £4,000 seemed to have been spent; how, his Lordship did not know. Then it was thought wise to sell the process, and it was proposed that somebody else would come in and find more money; consequently, syndicate No. 2 was formed, the object from the very beginning being that the proper thing to do was to sell it to the public—that was to say, to form a public company. Before they could hope to do that, however, they must get from a good firm of engineers, who possessed a good name, a favourable report, which would have been subsequently printed in a prospectus, and probably he (His Lordship) and the jury might, in due course, have found some of the prospectuses upon their breakfast tables one morning inviting them to subscribe. Defendants wanted that favourable report from a good firm, which he believed the plaintiffs to be, and for a favourable report they were willing to pay a certain price. There had been one report in the past, made to a member of syndicate No. 1, and the attention of the jury ought to be called to it, for it might be of some importance. It was made in December, 1896, by Sir Samuel Canning and Mr. Gatehouse, who, after dealing with the process, wrote the following:—"At the same time we think from the result of our trials that there is sufficient promise in the Guittari method to warrant a further expenditure to allow of a thoroughly practical and exhaustive series of experiments with an engine and boiler of reasonable horse-power." Bearing that in mind, counsel for the defence had indicated that the tests which formed the subject of this action were not sufficient. Well, the jury could put such value upon that as they thought proper. Following the course of events, it appeared that after they received the first report from Sir Samuel Canning, they approached him and his partner again, and further tests were arranged, which were supposed to be under as nearly the same conditions as possible, otherwise the whole thing failed. The first of the tests took place on August 2nd, and was substantially under Guittari's control, for the stoker, a man named Steele, who should have attended to the firing, under the pretext that he was frightened through having a number of Italians round him, left his work, and Guittari raked out the fire, remade it, and stoked till the end of the trial. It was important that that fact should be borne in mind, and that once they got the result of the Guittari experiment they could from scientific books ascertain fairly well whether the process was satisfactory or not. It was suggested by the plaintiffs that as soon as the result of the test with Guittari's mixture, Guittari himself stoking, was seen by Mr. Humes and Mr. Bale, who represented the defendants, they saw at once that they were not likely to get a report which would be of any marketable value to them. The only report which would have any commercial value to them was a favourable one. The Guittari test having been made, it did not appear that any objection was taken by defendants, except that it was not long enough, the objection being based upon what Sir Samuel Canning wrote in December, 1896, to an entirely different party, as to "exhaustive tests;" and certainly that objection was not made until plaintiffs asked for the balance of the fee agreed upon. With reference to the second test, on August 4th, and the conditions not being proper according to the defendants, there was no doubt contradictory evidence as to who did the stoking in the earlier part of the day; but his Lordship thought that did not matter. The real objection to that test was, that the blower was occasionally used to keep up the draught through the furnace. Well, a blower was a common appliance for the purpose of increasing and regulating the draught. Apparently there were conditions of the atmosphere where the draught was not so good at one time as at another, and sometimes the blower was used. Now, who put the blower there? The plaintiffs did not. It was part of the machinery which they found there when they made the test. What was it there for, unless it was to be used as occasion required? Did the jury think that Sir Samuel Canning and Mr. Gatehouse, and the people they employed used the blower unfairly? Why should they? They had no object in making an unfair or a wrong report. They said that they used the blower in such a way as to compensate for the difference in the atmosphere between the first test day and the second. No doubt there were changes in the character of the draught; it rose and fell, and had to be regulated as the changes occurred. But the real question in the case was this, was the work properly done? There had been a volume of evidence on one side that, notwithstanding the use of the blower the tests were properly carried out. A large number of witnesses testified to that, while, on the other hand, the defendants had called Mr. Humes, who said that in his opinion the test was not a fair and proper one. With regard to the report which plaintiffs prepared, his Lordship said he could not assist the jury very much as to that. He had it, but they had not seen it themselves. It was a very long report and had been handed up to him. Plaintiffs sent it to defendants in September, the month following the tests, and defendants at once said to them: "Take it away, we won't look at it, and we certainly won't pay you for it." Mr. McCall, plaintiffs' counsel, had suggested that the reason defendants refused to have it and pay for it was that they knew very well it was not favourable; and it might be that Mr. McCall's suggestion was right, and that the real reason was that it was not the sort of report the syndicate required. If the jury were of opinion that plaintiffs did their work in a proper and skillful way they need not be afraid to give them a verdict entitling them to the balance of their contract money. If, on the other hand, the jury came to the conclusion that they were neglectful, and did not go about their work as properly skilled men ought to have gone, by all means say so, and let them be made to give back to defendants the half of the fee which they had already paid, together with the sum which was claimed for damage done to the boilers, which was said to have occurred through the excessive use of the blower. That damage was laid at £25, which, to his Lordship's mind, seemed extraordinary. However, if the jury agreed to that figure, let them by all means allow it.

The jury considered for two or three minutes, when the foreman said they found a verdict for the plaintiffs for £78 15s., and also on the counterclaim.

Judgment was entered accordingly, with costs.

THE TELEPHONE INQUIRY.

(*Continued from page* 818.)

Mr. Hanbury presided on Thursday last week over a further sitting of the Telephone Committee.

Major-General Webber, Past President of the Institution of Electrical Engineers, said he had a considerable experience with regard to telegraphy. In 1867 he was deputed to examine the Prussian telegraphs, and made a report on that subject, and in 1870 he was instructed to take charge of a military contingent placed at the disposal of the Post Office, partly to assist in the instruction and maintenance of telegraphs, and partly to train soldiers for military purposes. In 1879 he left the Post Office, and having had experience of the earlier telephones, was asked to become a director of the Bell & Edison Telephone Company.

The Chairman: The information we want in the first place is as to the possibility of cheapening the present telephone service. Will you explain to us the defects and the cause of the high price of the present arrangement?—I would like to combine my answer under two heads. One is that a large amount of interest has to be paid on the capital expended on the system existent in this country, as was given in evidence by Mr. Forbes before the Committee presided over by Mr. Morley. That makes it clear that the rates cannot be reduced to anything like what is found in other countries. That, I think, is the prime reason why we have not got cheap telephony in the United Kingdom.

How far would that apply to the way the Post Office works them?—That comes under the other head, and is the cost of the construction of the plant. In 1870 the Post Office established a rate of charges for private wires in connection with telegraphy. I have always regarded these rates, which are more or less continued in connection with private purposes, as being almost prohibitive, and has made the telegraph and telephone only accessible to the rich. Owing to the cost of construction of telegraphic lines, and the same thing applies to telephonic lines, and owing to the heavy charges which have to be added, I am not prepared to say these rates are unfair, unless the Post Office are prepared as they are in the case of the Press to give special facilities.

Continuing, Witness said that in towns it cost more to lay wires underground than overhead, and the underground wires were laid more generally in England than abroad. He did not think that it was a distinct advantage to have underground wires unless the wires were very heavy. In all towns it was recognised as the right thing to have a metallic system, and that increased the weight. Before Mr. Morley's Committee he showed that wires laid in the City of London, estimated by Mr. Preece to cost £55, did not cost more than £15 or £18. It was cheaper to lay wires in the country than in a town.

As to the cost of working a system. Does the cost increase very much when you have very large exchanges?—That is a question which, I think, only those who have had the management of large exchanges, such as the Paris exchange, and the large exchanges in America can give an answer to. I am not competent, as I have never had charge of a very large exchange. I do not think it is very great, one way or the other.

Questioned by the CHAIRMAN as to how it would be possible to cheapen the telephone service and bring it into greater use, WITNESS said that they had had 28 years of telegraphy in charge of a public department in which everything was worked on business lines, and attention paid to the minutest details. It appeared to him that the National Telephone Company had had an example before them to try and vie with the Post Office in accuracy and minute attention to details and efficiency, but they had overlooked that which was attended to in other countries, viz., the day-by-day wants of the people. He was afraid, however, that he must admit that London must be dealt with differently from other parts of the country. What he meant by London was 300 square miles. Things had gone too far in London really to make any change. In a paper which he read before the Society of Arts in 1895, he showed the way to solve the difficulty, which was to provide a system for those who wished to communicate all over London at one rate, and provide a system for those who wanted to communicate within a given area. Every day that became more difficult in London, and three years ago he urged that the Post Office should take it over. He would have the regional system in London. At present he believed there were 11,000 subscribers in London to the National Telephone Company, and they all had communication with each other. He considered that there were two markets, so to speak, for the telephone. There were the people who wanted the use of the telephone over the whole area, and those who wanted it for their daily wants. He supposed why the company had not supplied the latter demand was the difficulty of wayleaves and the disinclination to bring down the charges. What he meant by the daily wants of the people was the facilities which should be given for a lady to speak to her tradesmen or her doctor. He would divide London into 11 areas, making the City and a certain district round it one area by itself, with a high subscription. The minimum subscription should be applied to a system of speaking within a given area.

Does the present service of the National Telephone Company lead to an increased cost of plant?—I think that London was never originally laid out except by myself, and that was in 1880, when I allowed for 200,000 subscribers and the length of lines.

So the cheapness would not come in there. Where does the cheapness come in?—The cheapness would be to the subscriber for facilities which the undertakers would provide by giving minimum facilities at a minimum rate. It is not right that if I wish to speak in Kensington I should pay the same rate as those who wish to speak all over London.

You bring in a large number of additional subscribers; what would that mean in the way of additional plant?—It would depend entirely on the number of people who wished to come in on the smaller system. That you could not find out until the scheme was before the public.

Do you argue that the larger the number of subscribers the cost per subscriber would be reduced?—The actual cost of inter-communication would be much reduced.

As I understand, your complaint is that the National Telephone Company serve at the present moment a particular class; that is, the rich commercial class, and the rate of subscription is high; but you think a proper telephonic service ought to cater for other classes, to come down to small tradesmen, for instance. I understand that it is said on one hand that the cost of working the telephone service actually increases very rapidly for every additional subscriber?—Yes, when every additional subscriber wants to speak over the whole system.

That is to say, supposing you get a system as in London, where every one of the 10,000 subscribers is put into communication with each other, the more additional subscribers you get the greater is the cost?—There comes into the question whether you provide the maximum facility only.

Let us get it quite distinct. I suppose one of your objections to the present system in London is that every subscriber is put in direct communication with the rest of the subscribers, and that gives facilities which are not wanted, and facilities never made use of by certain classes of the community. You think the service ought to be made more local, so that people might communicate with their tradesmen. As I understand under the present system supposing any large increase in the number of subscribers took place the cost of working would be very much increased. Is that so?—I do not think it would be more than a very small amount.

Was not evidence given before the Committee in 1895 to that effect?—It was.

On behalf of the National Telephone Company?—Yes.

I would like your experience on that point.—My experience of the working of large telephone exchanges is not sufficient to enable me to give an answer.

What I want to get out of you is this. You are an advocate of a cheap telephonic system. Will you give an explanation as to how that is to be carried out?—In London by having regional telephony, and by the Post Office taking it over. They have wayleaves and underground wires, and it seems to me to be eminently a case in which, for the future of London, the Post Office should take it over.

Continuing, WITNESS said he did not think if the London County Council worked a rival system they would gain much by competing with the National Telephone Company on the present lines, but there was the want he had mentioned which the company had never met. He did not see why Marylebone or Kensington should not have their own local telephone services. He advocated a cheaper telephone service for a local area, and if anyone wanted to communicate at a distance, they would have to have a separate telephone and separate wires, which should be of such a quality as to be passed by the Post Office.

Would it not be a disadvantage to have two services?—That disadvantage, whatever it is worth, has forced itself upon the practice of the country.

Do you distinctly recommend to the Committee that there should be two services; one set of subscribers to communicate only with the subscribers in a local area, and the other able to send messages to different parts of the kingdom?—Most distinctly.

But you recommend that on the ground that in the first place, by limiting it to a locality, you get it cheaper?—Localities who want to have services of their own might have a system constructed in a cheap way. If they required to speak outside their own area they must have a metallic return and a first-class instrument, such as is necessary to speak over the trunk wires.

Mr. BARTLEY: Would there not be an obvious objection to such a local system where the areas are close together? How would Islington communicate with St. Pancras?—I said that London must always have a metallic return.

The CHAIRMAN: We will take it that it will not apply to London, and we will take Glasgow. What is the best way to cheapen the telephone system in Glasgow?—The first thing would be to put up an entirely new system, which would not cost as much as the present one.

How would you do that?—I have not got the capital cost of the telephone in any of these towns.

We assume that there are no wires in Glasgow, and we start *de novo* putting up wires in Glasgow. Assuming that there were 10,000 subscribers, how would you start to work to construct a cheap telephone service—an efficient one—not only of use locally, but to enable every subscriber to communicate with London?

WITNESS replied that he had not come prepared to answer a question like that off-hand, but he would draw up an estimate and hand it in.

The CHAIRMAN said he would like the witness to draw up an estimate of a local service and a service for trunk communication.

Mr. COHEN: Would the metallic return apply to Glasgow as well as London?—To a degree, but I do not know what the electrical disturbances are in Glasgow.

WITNESS was then questioned by the CHAIRMAN as to a telephone service for country districts, and explained a scheme he had drawn up to apply to the County of Suffolk. He proposed that there should be 29 exchanges, which would require the construction of 524 miles of new lines along the roads not already occupied with lines by the Post Office, and it would require wayleaves also for wires of 252 miles on telegraphic poles belonging to the Post Office. The total mileage of wire required would be 3,970. This provision was almost entirely for call offices, and there was an estimate that there would be a certain proportion of private connections as well. The cost of the system of 29 exchanges provided, with 50 per cent. for spare connections, would be £4,375; 351 call stations, at an average of £7 10s., £2,633; 524 miles of new line, at £20 a mile, £10,480; 3,970 miles of wire on new and existing poles, at £5 a mile, to provide double conductors with metallic returns in the case of 950 miles, £23,820; contingencies, £4,130; total, £45,435. The interest and sinking fund, at 4½ per cent., would be £933; renewal of poles, £733; renewal of wires, £238; wayleaves, £574; wayleaves on existing poles, £675; management, £300; salaries for maintenance, £1,880; rent and sundries for 351 call offices, £3,159; rent, and sundries, and salaries for 29 exchanges, £2,958; contingencies, £593; total annual outgoing, £11,973. He estimated a profit of £990 a year on private lines, further, he would make a charge of £8 a year, and calculated to make a profit of £3.

Examined as to how the person going to a call office was to communicate with the person he wished to speak to at the other end, WITNESS said that a message would have to be sent to the person that he was required at the call office. He knew that was done in Canada. He estimated to make it pay in a village of 300 people, 2s. would have to be taken per day, 309 days in the year. He thought the National Telephone Company and the Post Office should have a greater number of call offices, but he could not say whether their plant would be sufficient to carry a greater number of messages.

Sir HENRY HOWORTH: Do you think if the company was to face their regional system it would get a good return on its capital?—I think it would be wise of them to expend the capital on it.

From your experience, how do you explain the enormous capital of this company in comparison with the cost of its plant?—I think when a system of this kind is administered for the whole of a large area like the United Kingdom, owing to the lack of local interest and superintendence, it necessarily becomes more costly.

Do you think it would be more economical for the Government to start *de novo* with its own plant, or to take over the whole of the company's plant at its capital value?—I am quite certain if it is practical it would be better to construct it *de novo*, but it is difficult to imagine such a thing as wiring England again.

Supposing it is done piece-meal by local authorities, would it be economical for local bodies to start their own plant, or to buy the existing plant?—Undoubtedly they should start with a new plant.

Further examined, WITNESS said that, owing to the monopoly of the Telephone Company, there were at present few telephone engineers in the country who could carry out other systems. At present, an associated company made the plant for the Telephone Company, but if a demand was created it could be made cheaply in England. If the municipalities were to be authorised to work telephones, there would be no difficulty in their getting plant, but there were no other firms in the country at present who manufactured it. He did not contemplate that at the expiry of the license of the Telephone Company, the company would cease to exist, for that would be chaos. But if licenses were allowed to municipalities now, and they competed with the company, it would mean the survival of the fittest.

By Mr. NICOL: He did not advocate the Post Office taking over the local exchanges, for he did not think they could work a capilliary system at a cheaper rate than a local organisation.

Mr. Stuart: Why should the Post Office not take them over in the country if they take over the system in London?

Witness explained that London could be compared with no other city in the world, and he thought that the Post Office, with its experience of laying wires, would be able to cheapen the cost.

The Select Committee resumed its sitting on Tuesday last, Mr. R. W. Hanbury presiding.

Mr. A. R. Bennett, of Harlesden, in reply to the chairman, said he was a member of the Institution of Electrical Engineers and a general consulting engineer and electrician. He was telephone engineer to the Corporation of Glasgow, and electrical engineer to the States of Guernsey, besides being a general consulting electrical engineer in London. He had had very prolonged experience in connection with telephone installations. From 1881 to 1883 he was engineer to the Commercial Telephone Exchange in Glasgow. Afterwards he was chief engineer for Scotland and Ireland to the National Telephone Company; in the following year he was promoted to be chief manager, as well as engineer to the company in Scotland, which position he held until 1890. From 1890 to 1892 he was general manager and chief engineer to the Mutual Telephone Company, and from 1892 to 1895 he occupied the same position in connection with the New Telephone Company.

Can you give us your opinion as to the possibility of providing telephone communication at lower rates, so as to bring the telephone service within the reach of other classes of the community than those enjoying it at the present moment?—I have devoted a great deal of attention to that subject, and I can testify that a good exchange connection, using the best of instruments and materials, could be constructed at a cost varying from £12 to £24 per subscriber, according to the size of the town or district to be telephoned.

This is not merely for a local service, but for a service which would be in communication with the rest of the kingdom through trunk wires?—Quite so. The difference between the cost of first class apparatus and second class is not very considerable, and I always make a point to put in the best, so that the price I have mentioned would enable subscribers to communicate all over the kingdom by means of Government trunk wires.

Is there any difference in the cost between a large town and a small one?—Yes, the capital outlay for a small or medium sized town, where one switch room suffices, is from £12 to £14 per subscriber, but in larger towns where several switch rooms connected by junction lines are required, the cost in the absence of special obstacles should range from £16 to £24 per line, excepting in London, where I estimate the cost would be £36 per line.

Will you explain why the price varies so much in these various towns, and particularly why it is so much larger in London?—In small towns the business community is generally gathered within a small area, consequently subscribers' lines are short, perhaps not exceeding on an average a quarter of a mile, whereas in larger towns the commercial people are scattered to a very much larger extent, and if they were connected with one central exchange the average length of their lines would be considerably in excess of the average length of smaller towns. In that case it is usual to construct several switch rooms, which has the effect of reducing the average length of subscribers' lines, but which requires additional lines for junction lines for connecting the various exchanges. That accounted for the difference in cost between a large provincial town and a small town. In London asphalte and wood pavements existed to a very much larger degree than was the case in provincial towns, and the cost of making good such pavements was very considerably in excess of the cost of making good either macadam or granite blocks. It was necessary, therefore, to make special allowances for London. Continuing, witness said he did not attribute the present cost of the telephone service in London to the fact that too large a number of subscribers were put into communication with each other. As he understood it at present, every subscriber was in connection with all the others, and he did not think the telephone would be of much use if the exchange was restricted to certain localities. There were instances in which that had been done, but when they looked abroad and found the very large exchanges which existed—for instance, in Berlin, where there were 29,000 subscribers—it certainly was not time, when we had only 10,000 subscribers in London, to talk about limitations.

Does the cost increase very much as the number of subscribers to exchanges increase?—No. I know it is generally said to be so, but I always considered that to be a fallacy, and I shall be able to put figures before you dealing with that very point. Mr. Provand, M.P., has recently obtained through the Foreign Office the particulars of a good many foreign telephone exchanges, which I believe he will put in to the Committee. Amongst those reports are a very valuable series from the German Government. The German Government say that in Berlin they have 28,785 exchange instruments at work, and that the capital cost per line had been £22. In Hamburg they had 13,561 exchange instruments at work, and the average capital cost has been £23. In Leipsig there are 5,289 instruments at work, and the capital cost has been £19 2s. In Franfort-on-Main there are 5,063 instruments at work, and the capital cost has been £22 18s., and at Cologne, there are 4,701 instruments at work, and the capital outlay there has averaged £19 12s. It is obvious that the cost in Berlin is not sensibly greater than the cost in Cologne, although the number of subscribers in Berlin is very nearly 17 times the number in Cologne, and that accords with my own experience.

The service in Berlin, where there are 28,000 subscribers, costs £22, as against £36 which you estimate it ought to cost in London. Why is it?—Of course, Berlin, although a very large city, is considerably smaller than London.

But why, in your opinion, does this difference of £14 arise between the two cities?—I should say that on the whole Berlin is a much easier town to telephone. It is not so scattered as London, and it does not cover nearly the same superficial area. Then, again, the pavements there are not wood or asphalte to nearly the same extent as they are in London.

Witness, continuing, said that in Switzerland, Luxemburg, Finland, Norway, Denmark, and Sweden, there were very extensive country systems.

Does it extend to the small villages of 300 or 400 population, for instance?—Yes, in some countries there is scarcely a village of that size without a telephone exchange—especially is that the case in Switzerland and Denmark.

Do you know any country where the rates vary according to the use made of the telephone?—Yes, in Switzerland and in Guernsey, where the telephone exchange is not yet opened; the States have adopted a system of charging which will enable the subscribers to pay in accordance with the use they make of the telephone. With reference to the service in Jutland, there was no Post Office monopoly, but the Danish Government was now in process of taking over as many trunk lines as it could. The Danish Government thought with our Government that the trunk lines ought to be in the hands of the Government.

If a message is sent in Jutland from a call office from a subscriber to a person who is not a subscriber, how is the message delivered at the other end?—I cannot answer that question specifically, but in Copenhagen the operators at the call office are allowed to write down a few words on a slip of paper—practically, they are allowed to write down short telegrams, and they are delivered by the post office.

Is there an extra charge for that?—Yes, of about 1d. for 10 words. Continuing, Witness said he was in favour of making the best use possible of the telephone, and he would very much like to see the telephones and the Government working more closely together. If that were done it would have a very considerable effect in increasing the usefulness of the telephone, but so far the Post Office seemed to be possessed with a desire to restrict the telephone service as much as they could.

In London at present a man pays the same subscription, whether he sends 1,000 messages a year or two. Do you think it is impossible by any system to let people pay according to the user of their private wire?—The system of paying a lump sum is one which prevails to a very large extent, but another system has prevailed in Switzerland for a good many years past. In Switzerland, a subscriber pays £4 for the first year, £2 16s. for the second year, and £1 12s. for the third, and subsequent years of his connection with the telephone exchange, and in addition to these annual payments, he is charged at the rate of 4s. per 100 calls which he makes; the man who is called is not charged anything. Consequently a subscriber who has 365 calls per year pays the annual subscription in the first instance, and then he pays another halfpenny per day for his calls, and as he is only a small user he only pays a comparatively small sum to the Government, particularly if he has been a subscriber for three years; but a man who calls five or six times a day has to pay practically 3d. a day, and so in Switzerland they make the charge dependent practically upon the user. In Guernsey they had adopted practically the same plan, but with a smaller initial charge. In Guernsey the charge was to be 30s. per annum down, and 1d. per call up to 1,000 calls per annum, and everything over 1,000 calls at the rate of five calls per 1d. If a very small user only called once every two days his total annual charge would be £2 5s. 2d.; if he calls once a day his total annual charge would be £3 0s. 5d., if he calls twice a day the total annual charge would be £4 10s. 10d., and similarly three, four, and five calls a day would bring his charge up to £5 14s. 11d., £6 1s., and £6 7s. 1d. respectively.

By Sir James Woodhouse: At present no maximum had been fixed for an unlimited user.

Replying to the chairman, the Witness said that in Switzerland the number of subscribers was very large in proportion to the population. Norway had the largest number of subscribers to the telephone in proportion to population, where there was 144 persons to each telephone. In Sweden, the numbers worked out at 147; in Luxemburg, 160; 172 for Switzerland; 211 for Denmark; 328 for Finland; Imperial Germany (post office), 449; Bavaria, 451; Wurtemburg, 459; then came the United Kingdom with 636, which was the sum of the National Telephone Company's subscribers and the Post Office subscribers. France was very low down —1,342, and in Austria the figures were 1,640 to every telephone. With regard to Guernsey he expected the exchange would be opened shortly, and about a fortnight ago there were 325 subscribers. He could not tell exactly what the capital charge would be, but the estimated cost was £13 14s. per subscriber, and they had every reason to believe that the charge would be kept within those limits. The population of Guernsey was 35,000.

So at present you have not got a very large proportion of subscribers? —325 works out at something like 180, whereas in the neighbouring island of Jersey, which is worked by the National Telephone Company, the number of subscribers is only something like 80, and the population is over 20,000 more than Guernsey. When the National Telephone Company opened in Jersey they began with a £10 rate, with limitations as to distance, but they did not get many subscribers at that rate and they soon reduced it to £8. That was in 1895, and they had about 40 subscribers in the island. Then when Guernsey showed that it wanted a telephone system and was pressing the Post Office to grant it and the Guernsey tariff was published, the National Company reduced their rates in Jersey to £6 10s. per annum without any limit of distance. The consequence of that reduction had been that they had exactly doubled the number of their subscribers. Witness then explained to the committee that the estimate he gave before the Glasgow inquiry as to the cost of establishing a telephone service in that country was based upon estimates he had received from reliable firms. The cost of telephone material was undoubtedly falling, and there was also a likelihood of a reduction being effected in the working. There was a new automatic switch room exchange which would dispense with the services of the lady operators. He had tested the invention himself, and he thought that for exchanges up to 600 or 1,000 subscribers it was likely to answer extremely well indeed.

But you don't think it would answer for the larger exchanges?—The inventors claim that they could do it up to 5,000 or 10,000 subscribers, but they have not done it yet. At the present time, however, for exchanges up to 400 or 500 subscribers, it was actually in use in several towns in the United States. Continuing, the witness said that most of the materials used in telephony was imported from abroad. The cables were made in this country.

Replying to Sir J. Woodhouse, Witness said that the reason why the materials were not produced at home was that there was not sufficient scope to allow of manufacturers competing with firms abroad who also sold materials in their own countries. If the telephone system in England were free it would have a most important effect upon many electrical industries, and he believed that the telephone industry would be equal to the bicycle industry in importance. His estimate for Glasgow was five guineas per subscriber, which, he reckoned, would enable the Corporation to get a return upon its capital outlay; but he thought that, with careful management, local authorities throughout the country might even improve upon that amount. A local authority had no expensive board of directors to pay, and it was free from many other charges which a company would have to pay. He was decidedly of opinion that it was to the public interest that there should be competition in telephones, but he would not go so far as to say that the best competitors would be the local authorities. His idea was that local management was a very essential feature in telephones, and whether that local management came from a municipality or a local company, did not, in his opinion, affect the matter much. What was wanted was a knowledge of local requirements.

By Mr. Fry: It would be to the advantage of the public and of the electrical industry if competing services were established.

Mr. J. Stuart: He did not believe the National Telephone Company could make a £5 rate pay. It could only be done in the case of an entirely new company, or by a municipality. He thought the London County Council, which had special facilities for creating a telephone service in London, would be able to give local services for £5 or £5 5s.

Mr. J. C. Lamb, C.B., second secretary to the Post Office, was recalled, and briefly examined as to the policy which the Department had pursued in relation to the extension of exchange areas to the National Telephone Company. He said that the Post Office had acceded to the requests of the National Company for new areas when they thought they were needful in the interests of the public. Mr. Forbes refused to sign the agreement of 1892 until he obtained a verbal promise from Mr. Ferguson that it would be carried out by the Post Office in a reasonable spirit, and that verbal agreement was subsequently ratified by Mr. Arnold Morley.

The Committee then adjourned.

NEW PATENTS AND ABSTRACTS OF PUBLISHED SPECIFICATIONS.

NEW PATENTS.—1898.

Compiled expressly for this journal by W. P. Thompson & Co., *Electrical Patent Agents*, 322, *High Holborn, London, W.C., to whom all inquiries should be addressed.*

12,200. "Improvements in fittings for gas and electric pendant lamps and the like." J. Morris, jun. Dated May 31st.

12,201. "Improvements in quadruplex and multiplex telegraphy and to apparatus for use in connection therewith." S. G. Brown. Dated May 31st.

12,220. "Improvements in or connected with electrically driven vehicles." C. Jeantaud and W. C. Rechniewski. Dated May 31st.

12,232. "Improvements in tele-motor apparatus for working, steering, telegraphing, indicating, and other apparatus from a distance." A. B. Brown. Dated May 31st.

12,237. "An improved A B C transmitter for telegraphic purposes." W. Milner and C. C. Vyle. Dated May 31st.

12,241. "Multiplex and duplex printing telegraph." A. Silbermann. Dated May 31st. (*Complete.*)

12,268. "Improvements in insulating means for electric furnaces." W. L. Wise. (The Aluminium-Industrie Actiengesellschaft, Germany.) Dated May 31st.

12,313. "Improvements in secondary batteries or electric accumulators." F. King. Dated June 1st.

12,321. "Improvements in electric batteries." E. Edwards. (P. A. Emanuel, United States.) Dated June 1st. (*Complete.*)

12 322. "Improvements in electric batteries." E. Edwards. (P. A. Emanuel, United States.) Dated June 1st. (*Complete.*)

12,323. "Improvements in electric batteries." E. Edwards. (P. A. Emanuel, United States.) Dated June 1st. (*Complete.*)

12,325. "Improvements in apparatus employed in wireless telegraphy." G. Marconi. Dated June 1st.

12,326. "Improvements in apparatus employed in wireless telegraphy." G. Marconi. Dated June 1st.

12,347. "Improvements in electric railways or tramways." J. J. Steinbach. Dated June 1st.

12,349. "Improvements in microphones." Siemens Brothers and Co., Limited. (Siemens and Halske, Gesellschaft, Germany. Dated June 1st. (*Complete.*)

12,350. "Improvements in electric alarums." Siemens Brothers and Co., Limited, and J. Ebel. Dated June 1st. (*Complete.*)

12,351. "Improvements in portable telegraphic apparatus." Siemens Brothers & Co., Limited. Dated June 1st. (*Complete.*)

12,354. "Improvements in microphones." J. Berliner. Dated June 1st.

12,365. "Improvements in portable electric lamps for use in mines and other places." S. F. Walker. Dated June 2nd.

12,423. "Improvements in electric switches." A. Vandam and T. H. Marsh. Dated June 2nd.

12,431. "Improvements in apparatus for the production of electricity in railway carriages and other vehicles." E. J. Preston. (The Gould Coupler Company, United States.) Dated June 2nd.

12,437. "Improvements in or relating to electric arc lamps." C. Oliver. Dated June 2nd.

12,438. "Apparatus for indicating leakages or escapes of current from electric conductors." M. Kallmann. Dated June 2nd.

12,446. "A new or improved hub for generating electricity for use with velocipedes and other vehicles." J. E. Preston and B. Wharton. Dated June 3rd.

12,461. "Improvements in, and in relation to fenders for electrical and other tramcars, motor cars, and such like vehicles." J. W. Towle. Dated June 3rd.

12,471. "Improvements in electrically-propelled motor cars." L. Coudat. Dated June 3rd.

12,562. "Improvements in or relating to electric motors and the transmission of power therefrom." Fawcett, Preston & Co., Ltd., and C. A. Matthey. Dated June 4th.

12,580. "Improvements in the manufacture of conduits for electric cables or conductors, and in the method of securing the said cables or conductors therein." F. Chiesman and S. Chiesman. Dated June 4th.

12,604. "Lunaria electric cycle and carriage lamp." S. G. Hamilton. Dated June 4th.

12,606. "Improvements in electrical firing keys." C. A. McEvoy. Dated June 4th.

12,511. "Improvements in or relating to incandescent electric lamps." O. Riebensahm, J. Pleichati, H. Friedeberg, and E. Kruger. Dated June 3rd.

ABSTRACTS OF PUBLISHED SPECIFICATIONS.

Copies of any of these Specifications may be obtained of Messrs. W. P. Thompson & Co., 322, High Holborn, W.C., *price, post free,* 9d., *(in stamps).*

1897.

996. "Improvements in and relating to accumulator plates." W. Majert. Dated January 13th, 1897. This relates to accumulator plates for high current density and capacity. This is produced by increasing the surface, which is effected by dividing up the lead core plate on both surfaces into thin strips which are formed by a suitable tool into vertical ribs. The tool has a surface situated behind its cutting edge which bends the strip that has been divided from the plate into a rib. 3 claims.

8,280. "Improvements in and relating to electro-medical apparatus and brushes for use therewith." C. Klein. Dated March 31st, 1897. The object of this invention is to enable a current of requisite strength to be applied to the body. In this apparatus there is a pivoted contact piece operated by a rod sliding in a guide and fastened to a movable core in an induction coil. This core carries a pointer which give indications upon a graduating strip. There is a screwed rod located in position in its support, one end of which engages with the commutator spring. In brushes there is a metallic support carrying a flexible plate upon which metallic bristles are so arranged as to make contact with the plate, when pressure is applied; this plate having a conducting wire attached and situated in a suitable part of the brush. 3 claims.

17,691. "Improvements in electrical conduits." H. L. Doulton and C. E. Morris. Dated July 28th, 1897. This relates to jointing butt lengths of earthenware conduits and making branch connections with the conductors in them. Metal collars are used to secure mechanical strength. Each collar is in two parts, which embrace the adjoining lengths of conduit, and are provided with lugs and clamped together by bolts. A space is left between the two pieces of the collar to allow for variation in the size of the conduit. This space is covered on the outer side by flanges. In making branch connections with the conductors within longitudinally divided lengths of conduit are used. Slots are provided for the passage of the branch cables and there is connecting piece which fits in the outer slot, the end of which is provided with a socket. Another method of making a branch connection is to substitute an iron box for a length of conduit. The box is divided, and the two portions secured by bolts, at each end is an interior annular cavity. It is provided with openings for branch cables. 6 claims.

THE

ELECTRICAL REVIEW.

VOL. XLII. JUNE 24, 1898. No. 1,074.

CONTENTS:

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON.

Telegraphic Address: "AGEEKAY, LONDON." Code A B C.

Telephone No. 988 Holborn.

ALL Letters should be addressed to the Proprietors, H. Alabaster, Gatehouse & Co.

ADVERTISEMENT RATES ON APPLICATION.

The "Electrical Review" is the recognised medium of the Electrical Trades.

SUBSCRIPTION RATES.—In *Great Britain*, Post Free per Year, 19s. 6d. To *all other countries*, per Year, £1 4s.

BINDING.—Subscribers' numbers bound, including case, for 4s. each volume.

CASES.—Cloth Cases for Binding can be had, price 2s. 6d. each.

READING CASES, to hold from One to Twenty-six Numbers until the Volume is complete for Binding, can now be had from the Publishers, Price 6s. or Free by Post (in Great Britain), 6s. 6d.

FOREIGN AGENTS.—New York: D. VAN NOSTRAND, 23, Murray Street. *Paris:* VEUVE J. BOYVEAU, 22, Rue de la Banque. *Berlin:* ASHER & Co., 5, Unter den Linden.

Cheques and Postal Orders (on Chief Office, London) to be made payable to Mr. H. ALABASTER, 4 Ludgate Hill E.C.

SPEEDS OF ATLANTIC CABLES.

THE table of figures giving the speeds of transmission over different Atlantic cables, published in our issue of June 3rd, has attracted a good deal of attention. The principal feature of the table is a comparison of the speeds of the two 1894 cables laid by Messrs. Siemens Bros., and the Telegraph Construction and Maintenance Company respectively. The Mackay-Bennett cable laid by the former, with a K R of 4·671, has a speed of 40 words per minute, and the Anglo-American cable, with a K R of 2·42, has a speed of 47·4 words per minute. That is to say, the speed obtained on the Siemens cable, making allowance for its higher K R, is 63 per cent. greater than on the Anglo-American cable. This figure, sufficiently startling in itself, is still more so if closely examined. The small undulations of the syphon trace, working at 45 words a minute, correspond to those of an alternating current of about 17 ~ per second, and at 75 words a minute to about 28 ~ per second. The amplitude of alternating signals received at the rate of 17 ~ per second over a cable having a K R of 2·42 is 13·6 times as great as the amplitude when received at the rate of 28 ~ per second, the amplitude of the sent signals, or, in other words, the alternating E.M.F. employed, being the same in both cases. The expressions from which this figure is calculated were given in our Vol. 41, p. 191. Column 10 of the table we are referring to gives a comparison of the efficiencies of the Mackay-Bennett and Anglo-American cables as 77·2 to 47·4, which we have taken as 75 to 45 in round figures; which implies that a cable manufactured by Messrs. Siemens Bros., of the same dimensions as the Anglo-American, would transmit alternations with 13·6 times the amplitude of those transmitted by the actual cable laid by the Telegraph Construction and Maintenance Company. This comparison of the cables has no meaning, unless the terminal arrangements of the two are similar or equivalent, and in which case we have to meet an assertion that of two cables similar in all respects, and having the same electrical constants, one transmits an alternating current 13·6 times as well as the other. If this can be established, the accepted theory of cable transmission has to go, and with it column 10, which is calculated on the assumption of the K R law. But the explanation must be looked for in the arrangements at the terminal stations, and it would be interesting to know how, with the apparatus in ordinary use, such a marked improvement is obtained. An improvement, however, of much more than 60 per cent. in speed over the syphon recorder is probably attainable in simplex working by using a photographic recording slip and a mirror. The principal impressions we draw from the table are the difficulty of comparing the working speed efficiencies of cables, when so much difference exists between the practice of two neighbouring stations as regards the kinds of instruments used, and the methods of transmitting and receiving signals. We are not aware to what degree of exactness the accepted law of electrical propagation has been verified, but it is hardly possible that there can be any serious error in it.

On Electrolytic Corrosion of Gas and Water Mains at Glasgow.

Mr. Chamen has made a report to the Gas and Water Departments of the Glasgow Corporation on prevention of electrolysis of the gas and water mains along the Springburn electric tramway route. Mr. Chamen found the electrical resistance of the steel rails to be about ten times that of copper, or in actual figures the resistance of 42 feet of rail is ·0003575 of an ohm. The sectional area of the rail is 10 inches. The resistance of the copper bonds, including the points of junction or contact with the rails, measured with two bonds in parallel, as they are actually being laid, averages ·000066 of an ohm. The length of the line from Springburn to Mitchell Street is about 13,400 feet. With 20 cars running on this route taking each an average current of 25 amperes, Mr. Chamen estimates that the return current in the section of the line nearest the power station will be 400 amperes. The greatest fall of potential between one terminus and the power station he estimates at 5·56 volts. This is well within the Board of Trade limit of 7 volts, and the tramway department do not, therefore, intend to put in return feeders. Mr. Chamen thinks, that with good bonding of the rails, there will be no fear whatever of electrolysis of gas or water mains. We doubt whether, under all conditions, this decision would be safe. Though the Board of Trade limit of 7 volts may nowhere be exceeded, the steepness of the potential gradient at some point along the line may be such as to imply a much greater total P.D. than 7 volts. For instance, in this case the return current of 400 amperes in the home section of the line implies a P.D. of more than 11 volts. With a return current of 400 amperes, as much as 100 to 200 amperes may flow through gas and water pipes situated in the neighbourhood of the line. A current of 100 amperes flowing through even a small section of a pipe system should not, we think, be regarded by the gas and water departments of the Glasgow Corporation with equanimity. If the nature of the soil is favourable very little harm may be done for many years, but, on the other hand, if the conditions are unfavourable the gas and water pipes may be rapidly corroded at joints, or at the place of exit of the current. The use of the insulated return feeder, with supplementary E.M.F., which has already been so successfully applied, would obviate all these risks, and considering only the data given in Mr. Chamen's report, we are somewhat surprised to find that he is of opinion that no return feeder is necessary.

An Electrical Gear for Motor Cars.

The *Western Electrician* of Chicago, of May 14th, published an account of a proposal by William Morrison, "the Chicago inventor," for driving motor cars and similar purposes, which is interesting and suggestive. The prime motor, a 4 H.P. gasoline or oil engine, drives directly, and at a constant speed, the field magnet system of a small 4-pole dynamo built in a circular form, and enclosed in a cylindrical case of gun-metal. The armature of the dynamo is connected to the driving gear of the vehicle. Thus the field magnet system and the brushes revolve at a constant speed, 600 revolutions per minute, while the armature revolves at a speed proportional to that at which the carriage is travelling, and in the same sense as the field magnets. Access is obtained to the dynamo circuit by contact rings and brushes, so that regulating resistances can be inserted. The only connection between the engine and the wheels of the carriage is the action between the field magnets and the armature, producing a torque on the axis of the latter; and this torque depends partly on the excess of the speed of the field magnets over that of the armature, and partly on the resistance inserted in the dynamo circuit. When the carriage is at rest, or just starting, so that the armature is at rest, the difference in speed between the field magnets and the armature has its greatest possible value, and the arrangement is then most favourable for producing a large starting torque, while the torque is under complete control at all speeds by means of a rheostat in the dynamo circuit. The speed of the oil engine is maintained nearly constant by means of a governor regulating the admission of oil. So far as it is possible to form an opinion of such an arrangement without practical experience of it, the principle of action greatly commends itself. The insertion of an electrical link between the prime mover and the wheels of a motor car, giving flexibility and simplicity of regulation at the expense of a certain loss of efficiency is the idea of the Heilmann locomotive, but Mr. Morrison's arrangement is by far the simpler and more ingenious of the two, and appears to be well suited to its object. No system of mechanical gears for different speeds seems comparable to it in simplicity, while it allows an engine running constantly at full speed to be thrown into and out of gear with the carriage without shock or jerk of any kind, and without any movement of mechanical parts beyond those of the switch required to break or make the dynamo circuit. No description is given of the connection of the dynamo armature to the wheels of the carriage, but evidently some reversing gear is required. The article in the *Western Electrician* is illustrated, and shows the construction of the dynamo clearly.

Cheating the Cabbages.

Readers of the *Westminster Budget* may remember an article bearing this title which appeared a short time ago, in which an experiment in plant growing under the influence of electricity rays was popularly if not very accurately described. There is no doubt that in America, France, Russia, and other countries, much more attention has been given to the investigation of the effects of electricity on plant culture than in our own country, and though many inconsequent experiments have been carried out and made much of, our knowledge of the subject is certainly the richer for them. At the present moment an important experiment is being carried out in Finland by Prof. Lemstrom, of the University of Helsingfors, with a view to determining the influence of atmospheric electricity upon plant life. Prof. Bailey, of Cornell University, is, we understand, advising with Prof. Lemstrom in this investigation, which, we may say, has been suggested by the observations that in northern regions vegetation is very rapid, and this rapidity may be determined by atmospheric electricity to which it is contended the aurora borealis is due. Although in this country we have not paid much attention to the subject, it has recently been proposed to utilise the Cabot Tower, which is in course of erection on Brandon Hill, Bristol. The land around consists of about 20 acres, is uncultivated, and appears to be well situated for the purpose of experiments. The proposition is to collect atmospheric electricity, and to pass it into certain trial gardens in which plants shall be grown. For this purpose instead of fitting the lightning rod of the Tower with a single point, it is proposed to give it a crown of points. It is conceivable that by this method the supplies of electricity, if we may use such an expression, existing in the atmosphere, could be tapped and conducted by means of wires into small plots of ground, where they would end in earth plates. Dr. E. M. Cook, of the Clifton Laboratory, Berkeley Square, has offered to give his services in carrying out a proper scheme of experiments and to make the necessary observations. The cost of these experiments would be very slight, and it is certainly to be hoped that the good citizens of Bristol will be enterprising enough to accept Dr. Cook's offer. Very little accurate knowledge has been obtained concerning the action of electricity upon vegetation, and it seems to us that here is an opportunity for increasing it.

AN EXHIBIT OF THE MOORE VACUUM TUBE LIGHTING.

We have more than once referred to the ingenious system of vacuum tube lighting invented by Mr. D. McFarlan Moore. Mr. Moore's energy and perseverance in overcoming the practical difficulties connected with this new departure in electric lighting has evidently been rewarded by a considerable amount of success, if we are to judge from the unique exhibit at the New York Electrical Exhibition, of which we give an illustration.

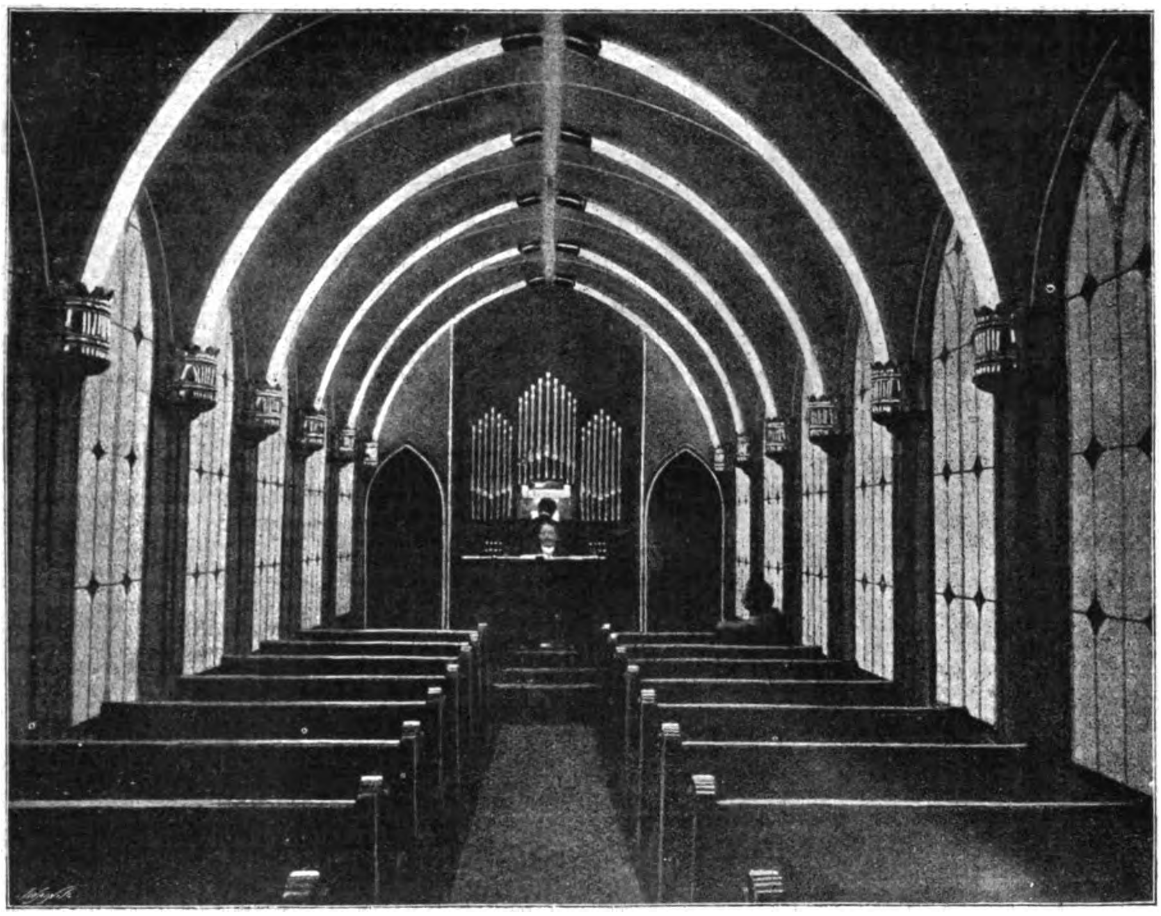
Mr. Moore has erected in the Exhibition a model chapel, complete in every detail, in which he shows to perfection the manner in which vacuum tube illumination can be carried out in practice. The front doors are open, and above their arches shine forth in vacuum tube letters the words: "Moore Vacuum Tube Chapel." The vaulted roof is ribbed with veritable arches of light consisting of long curved tubes of glass about 2 inches in diameter, and glowing their entire

It will be remembered that one of the salient points in Mr. Moore's system is the breaking of the current in a vacuum. This he accomplishes by means of a beautifully constructed rotator. Surrounding the rotator proper, which is of glass, 3 inches in diameter, and a foot long, is a Gramme ring, with its highly polished brass mountings, the whole constituting a beautiful piece of practical apparatus.

This apparatus just described is all that is necessary where multiphase currents are available; but in the exhibit the lower compartment of the cabinet contains a small rotary transformer.

According to Mr. Moore, the system, at its present stage of development, has an efficiency about equal to incandescent lighting; but the inventor looks for better results with the improvement of the tubes.

Besides the rotary vacuum break, Mr. Moore has got into commercial shape a vibratory vacuum break. This apparatus will be extensively used for advertising purposes. It can be used either on direct current circuits or alternate current circuits.



length with a pure white light. The tube arches spring from pilasters, each capped with a highly-polished specially-designed brass fixture, which may be seen in the figure. At the apex of the chapel ceiling where the tube arches meet, they are joined by a highly-polished decorated brass cylinder bent at its centre. The fixtures supporting the longitudinal tubes at the apex of the ceiling are also seen in the figure.

The church is wired with the Moore three-wire system of vacuum tube lighting; that is, all of the tubes—10 arch and 3 ridge tubes—are connected in parallel between three wires. The common or positive wire extends along the ridge, while each of the two negative wires extends horizontally along the side of the chapel back of the side fixtures, which rest on top of the pilaster caps. The three wires enter the top of a polished cabinet 2 feet by 2 feet 4 inches, which contains all the lighting apparatus, and is situated on one side of the entrance passageway. There also enters this cabinet at the top the three wires connecting with the street service of the Edison Electric Illuminating Company.

There are also many other applications for this system of lighting. For example, the colour of the light, even to the most delicate shades, can be changed simply by changing the degree of vacuum of the tubes, making it the ideal light for special decorative lighting. Another large field is in connection with photography—for photographers have long been longing for a light which could be regulated to a nicety, and thereby give uniform results. At the Electrical Exhibition in 1896, Mr. Moore took instantaneous portraits by his light.

It has long been a matter of expectation as to when and by whom vacuum tube lighting apparatus would first be placed on the market, and the fact that Mr. Moore is now taking orders is extremely interesting, since it is the beginning of a new departure in electrical work, which is destined, without doubt, to have a wide application.

The above account of Mr. Moore's recent achievements in vacuum tube lighting is abstracted from the *Electrical Engineer*, N.Y.

A SHORT METHOD FOR DETERMINING TRANSFORMER EFFICIENCY.*

By FREDERICK BEDELL.

That the common method for calculating transformer efficiency is laborious, and liable to error on account of long multiplications and divisions, has been pointed out by Mr. S. E. Johannesen in the *Electrical World*, p. 588, May 14th, 1898. He suggests a method which reduces somewhat the labour and liability to error; but his formula obtains the efficiency from the ratio of two quantities which differ from each other by only a few per cent., and consequently for accuracy each of these quantities must be very accurate and the long division carefully performed. Evidently, if instead of determining the per cent. efficiency direct we do so by determining the per cent. loss and subtracting from 100, the same degree of accuracy in the work will give greater accuracy in the result, and this may be done with less labour.

Let W represent the rated output in watts; let H denote the watts core loss and C the watts copper loss at full load. Let h_2 denote the core loss as per cent. of rated output W; that is, $h_2 = 100$ H/W. Let c_2 denote the full load copper loss as per cent. of rated output W; that is, $c_2 = 100$ C/W. (The subscrip 2 denotes that per cents. are referred to secondary output rather than to primary input.) Thus in a 2-kw. transformer W = 2,000. If the core loss is H = 30 watts the per cent. core loss is $h_2 = 1·5$. If the copper loss is C = 48 watts the per cent. copper loss is $c_2 = 2·4$.

Let g denote the fraction of full load, as $\frac{3}{4}$, $\frac{1}{2}$, &c. Obviously the per cent. copper loss varies directly as g, being $g\,c_2$ at any load. Thus at one-half load the per cent. copper loss is $\frac{1}{2}\,c_2$. (In watts, the copper loss at half load is one-quarter copper loss at full load.) The core loss in watts being constant, the per cent. core loss is greater as the load is less, being h_2/g at any load. Accordingly at any load g the total loss (t) as per cent. of secondary output is

$$t = g\,c_2 + h_2/g.$$

The total loss as per cent. of primary input is $t - t_2/100$. This must be subtracted from 100 to give the efficiency. Hence

$$\text{Efficiency} = 100 + \frac{t^2}{100} - t$$

To compute the efficiency accurately to four places, it is only necessary to compute t to three places and t^2 to two places. This may be quickly and accurately done by means of the following table:

EFFICIENCY COMPUTATION TABLE.

c_2 = ... = per cent. full load copper loss } as per cent of rated output.
h_2 = ... = per cent. core loss

Fraction of load.	Losses as per cent. of output. Copper.	Core.	Total, t.	$\frac{t^2}{100}$	Efficiency.
$\frac{5}{4}$	$\frac{5}{4}$ c_2 = ...	$\frac{4}{5}$ h_2 = ...	...	...	...
1	c_2 = ...	h_2 = ...	...	...	...
$\frac{3}{4}$	$\frac{3}{4}$ c_2 = ...	$\frac{4}{3}$ h_2 = ...	...	...	...
$\frac{1}{2}$	$\frac{1}{2}$ c_2 = ...	2 h_2 = ...	...	...	...
$\frac{1}{4}$	$\frac{1}{4}$ c_2 = ...	4 h_2 = ...	...	...	...
$\frac{1}{10}$	$\frac{1}{10}$ c_2 = ...	10 h_2 = ...	...	...	...

$$\text{Efficiency} = 100 + \frac{t^2}{100} - t.$$

The all-day efficiency, if the transformer is x hours on full load each day and on no load the remainder of the time, is

$$\text{all-day efficiency} = \frac{100}{100 + c_2 + (24 \div x)\,h_2}.$$

If the transformer is five hours on full load and 19 hours on no load, the all-day efficiency is

$$\text{all-day efficiency} = \frac{100}{100 + c_2 + 4·8\,h_2}.$$

* *Electrical World*, New York.

The facility with which these computations can be made may be seen from the following example:

EXAMPLE.

2-kw. transformer. Copper loss = 48 watts.
Core loss = 30 watts.

EFFICIENCY COMPUTATION TABLE.

c_2 = 2·4 = per cent. full load copper loss } as per cent. of rated output.
h_2 = 1·5 = per cent. core loss

Fraction of load.	Losses as per cent. of output. Copper.	Core.	Total, t.	$\frac{t^2}{100}$	Efficiency.
$\frac{5}{4}$	$\frac{5}{4}$ c_2 = 3·0	$\frac{4}{5}$ h_2 = 1·2	4·2	·18	95·98
1	c_2 = 2·4	h_2 = 1·5	3·9	·15	96·25
$\frac{3}{4}$	$\frac{3}{4}$ c_2 = 1·8	$\frac{4}{3}$ h_2 = 2·0	3·8	·14	96·34
$\frac{1}{2}$	$\frac{1}{2}$ c_2 = 1·2	2 h_2 = 3·0	4·2	·18	95·98
$\frac{1}{4}$	$\frac{1}{4}$ c_2 = ·6	4 h_2 = 6·	6·6	·44	93·84
$\frac{1}{10}$	$\frac{1}{10}$ c_2 = ·24	10 h_2 = 15·	15·24	2·32	87·08

$$\text{Efficiency} = 100 + \frac{t^2}{100} - t.$$

$$\text{All-day efficiency} = \frac{100}{100 + c_2 + 4·8\,h_2} = 91·24.$$

FURTHER BOARD OF TRADE REGULATIONS.

"Coming events cast their shadows before," and in this connection No 5 of the Minutes of the Special Committee on Electrical Energy is particularly interesting, as it contains the examination of Major Cardew on question 957, respecting danger to employés.

With modest hesitation, and only after considerable coaxing, Major Cardew admitted that he had a set of draft regulations for the protection of employés, but he said:—"I am hardly prepared to hand these regulations in; it is some years since I drew them out, and they may not touch every point which has turned up with the experience we have to-day." Nevertheless, they were handed in and, as will be seen in the "definitions," although they may have been originally sketched out several years ago, they have evidently been carefully kept and brought up to date. The title is as follows:—

"Regulations for the protection of employés in electrical supply works and other places wherein electrical energy is generated, regulated, transformed, or connected."

Amongst the "definitions" is to be found that of "high pressure supply," and is the same as that given in the regulations for the safety of the public, viz., anything exceeding 500 volts continuous, or 250 volts alternating.

Clause No. 1.—Provides that all metal work, not forming, or intended to form part of a circuit, whether structural or otherwise, whether in the generating station or sub-station, shall be efficiently connected to earth and to each other; luckily, nails, screws, or small fittings fixed so as to be in contact with dry wood or other non-conducting substance only, are excepted; but as the roof trusses, ties, &c., are not mentioned, we presume they are included as well as the firing irons and coal bunker doors!

No. 2 requires all high-pressure conductors to be completely enclosed in a tube of highly insulating material properly protected, or in earthed metal casing—this to be done as far as is consistent with the intended use of the conductor. Concentric mains with earthed outer are exempted.

No. 3.—Where it is not possible to entirely enclose such conductors, this clause provides that they shall be properly guarded, so as to prevent accidental contact, and shall also be conspicuously marked as dangerous by being labelled or painted red, and no such conductors shall be fixed within 3 feet of a doorway or other access to the generating station or sub-station. In the event of these rules being adopted and being retrospective, this clause will necessitate increasing the dimensions of a large number of sub-stations, and so abolishing what are now little better than man traps.

No. 4 requires an insulated floor or platform around switchboards, &c., and is a reasonable and proper precaution; but to so arrange the floor or platform that the attendant, when standing upon it, cannot possibly make accidental contact with earth, is a more difficult matter, and in some cases practically impossible.

No. 5 deals with switchboards, and states that they must be formed of highly insulating and incombustible material. We presume this refers to the bases of the switches or facing of the board, and not to the frame upon which they are erected, and is in this case a reasonable requirement. Connections must be made in front of the board, or, if taken behind a passage, at least 4 feet wide must be left, and the doors leading thereto must be kept locked, the key being in the charge of the chief engineer or other responsible person. The next paragraph is as follows:—"All leads and connections between which any difference of electrical potential greater than 5 (five) volts may exist must be easily distinguishable by position, colour, or other distinctive mark." We have tried to imagine what this is all about, but, in the absence of any explanation, we can only presume that it has something to do with fire risk, and refers to low tension stations. The last paragraph of this clause requires that adequate means shall be provided to enable an employé to ascertain when all electrical pressure has been removed from all metal he may be required to examine, clean, or alter. Very good.

No. 6. *Instruments.*—This clause will, we venture to say, raise some opposition on the part of station engineers, and is, to put it mildly, absurd!

"All instruments used, or intended (!) to be used, for measuring or indicating electric energy, current, or pressure, within any generating station or sub-station, shall be of suitable pattern and construction *and accurate in their readings within an error of 2½ per cent. at any point of their range*, in terms of the electrical standards deposited at the Board of Trade Standardising Laboratory; *and such accuracy must be constantly maintained.*" (The italics are ours.) This is simply Governmental regulation gone mad! and if enforced, would probably result in the scrapping of 99 per cent. of all the station switchboard instruments in existence. What on earth can be the object of such a regulation, and how can it possibly affect the safety of the staff either one way or the other! As we have said, the thing is absurd and could not be seriously entertained by anybody with reasonable intelligence, and after thinking the matter carefully over. It must be always remembered that these draft regulations are avowedly intended to protect the lives of the staff, and although our condemnation of the last regulation is strong, we think it quite justified until it can be shown that an error of, say, 3 per cent. in the reading of an ammeter, is going to jeopardise the lives and safety of anybody; even an error of 20 per cent. in a voltmeter could not do so, the idea is sheer nonsense. Surely any serious error in indicating or recording instruments would be corrected by the station engineer without any regulations; but, in any case, we fail to see in what manner it concerns the Board of Trade.

After the momentary mental aberration shown in the drafting of the last clause, it is with considerable satisfaction that we note *Regulation* 7, which provides that all generating and sub-stations shall be adequately illuminated, especially where attention is required to any high tension machinery, apparatus, or instruments. Not more than 50 per cent. of the total artificial illumination shall be supplied by the running machinery in the station, or from the mains, in case of sub-stations. This is very good indeed, so far as it goes, but the spirit of the clause, although obvious, could be evaded by lighting the works from storage batteries or similar source, quite independent of the running plant. Far better that the regulation should provide that the illumination be divided into two parts, each being supplied from separate and independent sources, so that in the event of the temporary failure of one part the station would not be left in darkness. As regards sub-stations, the provision of candles and matches as required in the regulation would suffice in addition to electric lighting from the mains.

No. 8 requires that when work other than switching, &c., is being executed in sub-stations, all high pressure mains and plant shall be discharged of electrical pressure or efficiently screened. Perfectly right.

No. 9 requires that rubber gloves shall be provided and kept in good condition; this is obviously necessary, and we should hope universally adopted.

No. 10 provides that printed instructions for dealing with persons in case of electric shock shall be conspicuously exhibited in the station, which, we believe, is now the general rule.

No. 11, and last, should be unnecessary, and we think would somewhat complicate the arrangement of shifts, while it would undoubtedly meet with strong opposition from those in whose interest the regulation is drafted. We give it in full.

"No employé in any generating station or sub-station shall be required to remain on any duty connected with the regulation of high pressure supply for more than four hours consecutively, or for more than eight hours in any day; and no employé shall be allowed to take over such duty until he has been inspected by an engineer or other competent official as to his fitness to undertake such duty."

As the regulation stands, a switchman or electrician may be required to work four hours, say, from 8 p.m. to 12 midnight, to go off duty until 4 a.m., and then to resume duty until 8 a.m. Without doubt he would much rather work eight hours, and then go off for 16 hours, as is now usual, and we do not think "the engineer, or other competent official," would care to become a sort of medical officer.

Taking the regulations as a whole, they are, with the exceptions noted, very reasonable; but they seem to be somewhat familiar, and we believe several of them were suggested by the committee appointed by the Home Office, whose draft regulations, by the way, seem to have been forgotten. The question is whether such regulations, dealing with the staff, should not be left to the Home Office; but in any case two sets are not required.

The report of the Select Committee on Electrical Energy ignores these rules altogether, and they must be looked for in a special Bill, which will probably be promoted by the Board of Trade, as the outcome of the inquiry.

ELECTRIC TRACTION.

The paper presented to the Municipal Electrical Association by Mr. R. C. Quin can hardly be said to contribute anything new to the common stock of knowledge on electric traction.

We were unaware that there was any considerable difference of opinion as to whether the rails should be 48 lbs. per yard or 92 lbs. per yard when electric tramcars are used. Considering the greater weight of electric tramcars, the maintenance of the bonding and the joints, there can be no doubt but that rails of at least 90 lbs. per yard are best suited for electric traction under ordinary municipal conditions.

In dealing with the subject of rails, we should have appreciated a discussion on the present rules of the Board of Trade limiting the width of the groove. In other countries a wider groove has been satisfactorily used, and better wear of the car wheels realised.

The mechanical construction of the rail joint is a matter that will stand a great deal of discussion, and traction engineers the world over seem undecided as to the best form of rail joint, this being the weakest part in electric permanent way construction.

The electric welding of the joints has not been entirely satisfactory. The nearest approach to a satisfactory rail joint is the Falk joint, and it does not seem improbable that a cast joint of this type will, sooner or later, come into general use in England. The advantages of a perfect rail joint are two-fold; first, that the mechanical construction becomes perfect, and secondly, the bond, no matter of what type, will be found more durable, on account of the greater rigidity of the joint.

The explanation of the type of rail joint used at Hamburg is not clear. We judge, however, it would be objected to by many traction engineers, since from what we gather of the description, the joint would be difficult to handle where rails have to be cut into unequal lengths.

We are unable to understand Mr. Quin's reasoning as to generators and fly-wheels. That there is considerable inertia in the car there can be no doubt, but this inertia is to be overcome by the prime mover. In the case of engines, the available force to overcome the inertia is the force exerted by the steam against the piston and the fly-wheel effect. If the steam cylinders are given sufficient capacity for doing the maximum that may occur by several cars starting at once, then they must be excessively large compared with the average load on the engine, which in traction work would not ordinarily be much beyond one-third of the maximum work to be done momentarily. Obviously, then, the only way to economically get the force required for momentarily overloading is by means of heavy fly-wheels. This agrees with practical experience, since engines have frequently fail-d to be satisfactory for electric traction until they have been equipped with heavier fly-wheels, and with heavy fly-wheels practice has fully demonstrated that the cylinders may be smaller, and consequently an economic gain under average working.

We do not understand why uniform E.M.F. in the line is not conducive to a uniform speed of the tramcars. Certainly the speed of an electric motor exerting a given horizontal effort varies directly with the E.M.F. at its terminals. There can be no doubt that in a system having practically constant voltage, the consumption of energy by the cars will be less than one having a varying voltage.

Further, constancy in voltage is important to secure good lighting of the cars in the night time. It is a most disagreeable sensation to see the lights go down when the cars start.

There has been much discussion as to the comparative values for quick and slow speed engines for traction purposes. Undoubtedly, in smaller sizes, the moderately quick speed engine has decided advantages as to cost over the Corliss or slow speed engine, but in the case of large machines there can be no doubt that the slow speed machinery will be found more efficient and more economical to maintain. That quick speed engines have been built beyond a proper size is sufficiently illustrated by a recent test on most approved high speed engines, and in which a 700 H.P. machine was found to have a mechanical efficiency of less than 85 per cent., whereas a Corliss engine of the same output, and with 90 or 100 revolutions, would have had a mechanical efficiency of 92 per cent. The best records of steam consumption so far published have been accomplished by slow speed engines, having very moderate piston speed.

In the discussion of motors there remains much to be said as to rating. A leading American firm in electric traction gave the capacity of a motor in terms of the horizontal effort at a given number of miles per hour. The motor was supposed to give a corresponding output for two hours, no part heating more than 50° C. We think such a method of rating if standardised would be most convenient. Owing, however, to the methods not coming into general use, it has been abandoned by those who established it from commercial considerations. It seems the great desideratum in connection with traction motors is to get the widest possible range of load at high efficiency. More recently, advances have been made in this direction by lessening the fixed loss due to hysteresis and eddy currents in the armature core, the amount of iron has been diminished and the amount of saturation correspondingly increased. It has been found that under average load the core loss is much smaller than in the case of a non-saturated armature, the effect upon sparking by greatly increasing the magnetisation of the armature core has been favourable. Another practical advantage of importance is the diminishing of the weight of the armature, and consequently increasing the durability of the bearings, and making the armature much more easily handled in the case of repairs and renewals. Undoubtedly great improvements have been made in using machines with cut steel gears, enclosed from the dust, and running in oil. There has been, however, a tendency on the part of some manufacturers to cheapen the motor, by using too great a reduction in the gears. Considering the gears by themselves, the reduction should not be more than four and a half to one.

The matter of control seems to be pretty generally agreed upon. In municipal working, where the cars have to be started and stopped at frequent intervals, the series parallel control possesses great advantages. It becomes unimportant, however, when the stops are infrequent, and cars run over long distances. It might be inferred from the paper that the maximum traction effort was dependent upon the method of control, that is, whether it was a series parallel, or an ordinary rheostatic control. This, however, is not the case. The maximum effort that may be given by a motor is limited to its safe current carrying capacity. If two motors were started in parallel with the same starting effort, double the current would be taken, but the current through each motor would be the same as though they were operated in series.

Undoubtedly the suggestion of a ton mile is in the right direction, but there seems to be no finality in discussing the unit of motive power. Some companies prefer double bogie trucks, others prefer the use of extra long wheel bases, regardless of the curvature, while others properly advise limiting the wheel base according to the radii of the curves. Practical engineers seem to have been slow in finding out that an abnormal long wheel base is uneconomical in the consumption of current on the curves, and in the wearing of the rails and flanges of the wheels.

We are at a loss to understand why a trolley should be more liable to leave the line at section insulators than at any other part. A properly constructed section insulator should present exactly the same form of surface to the trolley wheel as to any other part of the line.

There remains much to say on the subject of guard wires. Preferably the guard wires should be placed alongside the telephone wires. Two guard wires properly placed with cross wires every 10 or 15 feet would catch any telephone wires before they had fallen any great distance. The placing of the guard wires above the trolley wire is objectionable in appearance, more or less ineffective, and has the disadvantage of being at some distance from the telephone and telegraph wires, so that when a wire falls upon the guard wire it has acquired sufficient energy, under the best circumstances, to make it a source of danger.

The rule given for bonding by Mr. Quin seems rather a radical one, in that it is specified that there should be 2½ inches of contact area in the head of the bond, regardless of the current which it has to carry. Having in view that the web of an ordinary rail is not more than ½ inch thick, this rule would be equivalent to saying that under all conditions the head of a bond should be something over 1½ inches in diameter. We doubt whether many engineers would be willing to put such a regulation into force. A more satisfactory way of dealing with the problem would be to specify the maximum current density, since this determines the drop in the contact, and the liability of deterioration.

It is stated that 20 per cent. should be allowed for loosening of the joints. Such a recommendation does not seem to be consistent, since if the bonds loosen at all there seems to come between the joint and the rail a film of oxide, so that the contact is completely destroyed. Considering, however, that the body of the bond is of much less conductivity than the rail, the drop in the rail should be calculated, and allowance should be made for the drop in the bonds themselves.

The discussion on conduits is somewhat limited. From the municipal point of view, where there is no "21 years' purchase" clause to be considered, it seems possible that conduits may find favour in England in the future, especially in those cities where gas and water pipes will not be generally interfered with. The advantages of the double insulated conduit system are, that the trouble of dealing with the Board of Trade as to volts drop in the earth return disappears, and there is gained the great advantage of an entirely insulated return circuit.

While there is a great difference in figures as to the cost of maintenance and depreciation of accumulators, and the extra cost of running an accumulator system over that of the overhead trolley system, there can be little doubt that such extra cost exists in most cases to a practically prohibitive extent. The difficulties to be overcome in accumulators are first, to lessen the cost of maintenance; second, to lessen the first cost; and third, to lessen the weight, since the excessive weight of an accumulator car is objectionable, either the track or the rolling stock considered.

Various methods of charge and discharge have their advocates, according to the type and weight of battery, but the ultimate commercial result seems to be about the same in all cases. While figures more or less satisfactory have been coming from the Continent, we have to bear in mind the most prominent case in England, one in which various companies in turn came forward, believing that they could show the required result; each in turn failed to make a commercial demonstration, and advanced the opinion that they could obtain the desired result had the conditions been different, and while we have no particular faith in accumulator traction at the present stage of development of the electrical accumulator, we would be interested to see under what conditions of electric traction each accumulator company would consider that it might make a commercial success of electrical traction with its own type of battery. In the case of overhead lines it frequently takes some two or three years to so perfect a system of operating that the works' cost may be reliably made out and reduced to a minimum. The figures, then, as to accumulator traction on the most favourable basis would be misleading unless extending over a period of years, since the cost of maintenance of an accumulator is far more uncertain than any feature connected with the trolley or conduit system of electric traction.

The conclusion reached by Mr. Quin seems to be the only one warrantable, and the only one that will be reached for some time to come.

PROPOSED STANDARD DIAGRAMS OF ELECTRICAL APPARATUS.

By Prof. ANDREW JAMIESON.

You were kind enough to send me a copy of the *Western Electrician* and of *Electricity*, both of America, containing reports of a committee of the Chicago Electrical Association for February, 1898, wherein it was stated—

"The time has arrived when the diagrammatic illustration of electrical apparatus should be reduced to an art. A uniform code should be established containing a diagram for each piece of apparatus, each diagram being at once simple and, so far as possible, suggestive of the particular piece of apparatus which it is designed to represent."

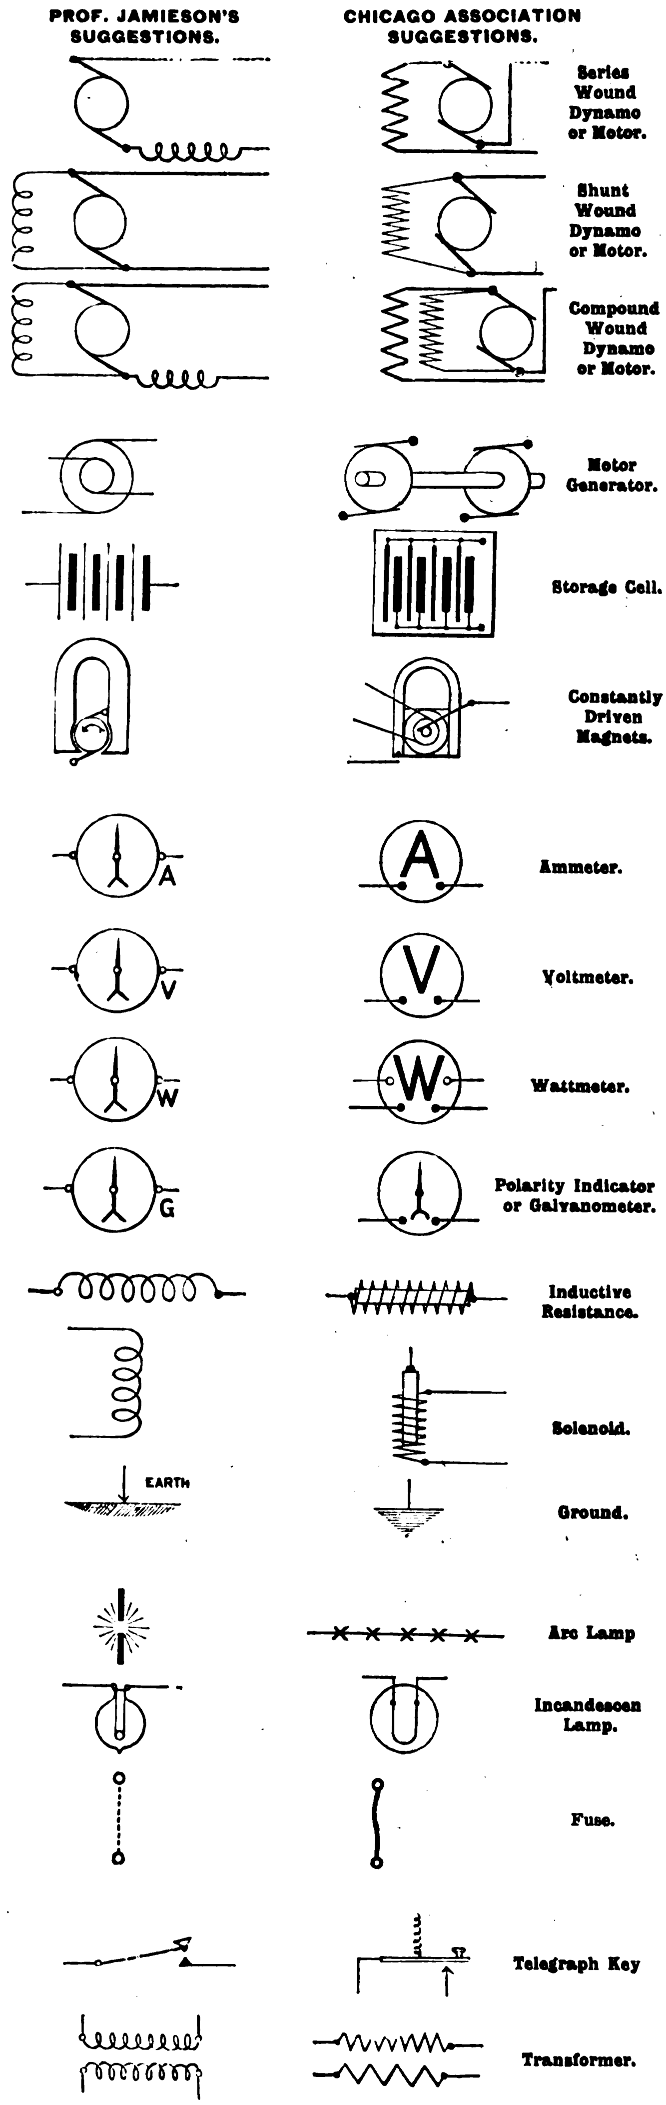
"A decided improvement has been made in this direction during the last few years, yet at the present time the system is far from perfect. Its development has suffered through a lack of unity among the various makers of these diagrams."

"The electrical divisions in the Patent Office have done more toward the development of this art than any other one agency. Often in a drawing accompanying an application for a patent, when a circle was used to represent a battery, and another circle exactly like it to represent a dynamo, and still another, differing in no respect, representing the ground, the drawing was necessarily confusing, and was followed with difficulty, if at all. In such cases it has not been infrequent for the Patent Office to suggest to the inventor or his attorney that he submit a new drawing, using a certain adopted form or diagram to represent his battery and another to represent his dynamo, and so on. In this way, and with the well-directed efforts of a number of patent attorneys, a great improvement has been made. These diagrams are to further assist in this direction."

Then follows some 55 diagrams of electrical apparatus with an explanation thereof. I have looked over these diagrams, and have read the remarks as published in the American papers, and herewith offer some suggestions for improvement in the proposed figures. I do so from having taken a special interest in this matter for a number of years, and from the fact that I read a paper in May, 1885, before the British Society of Telegraph Engineers on "Electrical Definitions, Nomenclature, and Notation," and when we had the benefit of M. Hospitalier's discussion thereon.*

Since then I have frequently advocated an International uniform system of definitions, symbols, and electrical diagrams, and have from year to year published in "Munro and Jamieson's Pocket Book," a few of the simpler figures.

* For M. Hospitalier's views, see "Communication faite à la Société Internationale des Electriciens, le Novembre, 1884," and for my paper see *Journal of Society of Telegraph Engineers*, p. 297, 1885, Vol. xv.



Consequently I have much pleasure in complimenting the energy and ability shown by the Chicago Electrical Association in going one step further than any other similar association has hitherto done. I have, therefore, taken the liberty of cutting out a few of their figures and pasting alongside thereof what appears to me to be improvements thereon.

In the first place, their figures for series, shunt, and compound wound dynamos or motors, have the objections of representing the field coils by zig-zag lines which have hitherto been universally adopted to represent non-inductive resistances, whereas the field coils of such dynamos are anything but non-inductive. Further, in the case of the series and compound wound dynamos or motors, their diagrams are unnecessarily complicated by drawing the leads from each brush with two right angles, whereas in the diagrams usually adopted by electricians, and shown in my figures to the left, the leads come straight away from the brushes.

Their figure for a motor generator is greatly simplified, and conveys the full meaning desired to be imparted by that which I have shown on the left.

With regard to the storage cell, I think all that is necessary to distinguish it from a primary battery are the letters S and B respectively, placed underneath the usually accepted sign of long thin and short thick parallel lines.

Granted that there are cases where it might be necessary to distinguish between the hand generators at subscriber's stations and the power generators at a central office, I don't see the slightest necessity of complicating the figure of a constantly driven magneto by inserting lines to represent the belt when a mere arrow on the armature spindle would be sufficient, as shown by my figure to the left of theirs.

With regard to ammeters, voltmeters, wattmeters, and polarity indicators, or galvanometers, I think you will agree with me that those shown on the left are much simpler, neater, and sufficiently distinguished from each other by the letters A, V, W and G.

In the representations of an inductive resistance and a solenoid, it will be noticed that the iron core is omitted in my suggestion as shown on the left. Surely, the fact of a wire being coiled in a spiral form is sufficient to convey the idea of the presence of a certain amount of self-induction ?

With respect to the next diagram, we do not in this country speak or write of a connection to the "*ground*," but to the *Earth*, and what could be more in harmony with the well-known and long-accepted telegraph symbol as shown on the left ?

There can be no objection to a number of crosses, as shown, to represent arc lamps in series, but for the indication of a single lamp I should recommend the diagram on the left.

My next three diagrams, as representing an incandescent lamp, a fuse, and a telegraph key, are also more in conformity with practice than the corresponding ones indicated by the Chicago Congress.

Finally, we have again to find fault with their use of the well-known symbol for non-inductive resistances in the representation of a transformer.

Other objections might have been found, but these are sufficient to show a diversity between American, British, and Continental practice, and hence the need for coming to an early state of uniformity.

STANDARD METHODS OF ENGINE TESTING.

More than ourselves, Americans have aimed at standardising everything, and they have fairly well agreed on a standard method of testing boilers and also pumping plants, but, so far, without including power engines, excepting locomotives. Mr. Geo. H. Barrus, a well-known expert, pleads for a standard method of engine testing in a paper to the American Society of Mechanical Engineers. It is desirable that something of this sort should be arranged with a view to bringing experimenters into line and expressing results on a system whereby one test can at once be compared with others, so far as comparison is possible. Such a system involves, of course, an adherence of the engine builders who should turn out no engines unless suitably provided with testing facilities.

The present writer was recently testing a plant by a first-class firm which was provided with means for taking the temperature of the boilers. The means of doing this had not been placed there by the makers but by the owners, and consisted of iron tubes screwed into the manhole cover and filled with mercury. The tubes did not, however, extend into the boiler as they should have done for at least 6 inches, in order to secure that the mercury should be practically as hot as the steam in the boiler. Between the steam gauge and the thermometer reading there was a very serious discrepancy which completely vitiated the readings, and they were discontinued. The fault was pointed out to the owners at the time. If tests are to be standardised and a given system or method should thus come to be a kind of official recognition, it will behove testing engineers to be exceedingly careful in even such small matters. In the case in point the rendering of false figures might have satisfied the owner, in that he could not have known their inaccuracy.

Of course these remarks apply more particularly to the testing of special inventions generally. A man who agrees to pay for a report which he has been hoping will be a good report on which to sell a patent, is disappointed when he gets an unfavourable report, and sometimes will snatch at the veriest straws of an excuse in order to avoid payment, and it is by no means always easy to bring clearly out in a Court of Law that a test has been fairly conducted, company promoters seeming to think that engineers are made for the purpose of reporting within lines to be laid down by the promoters, and which cannot give fair results. Having so far protested against standard methods, we may fairly consider Mr. Barrus's proposals.

As regards efficiency tests, the requirements are the weight of steam consumed and the power developed, and these two elements are fundamental, whatever the type of engine, and whatever the class of work performed. Tabular results may thus come under the above two heads, the one dealing with such data as apply to the working of steam in the cylinder, and the other with the data pertaining to the special duty of the engine. Thus the first section would contain all data of feed measurement, the steam consumed in jackets and reheaters, the quality of the steam, the weight of steam used by auxiliaries, and all data as to pressures, temperatures, and speed, with further figures to be obtained from the indicator cards. It would also present the efficiency as per the standard method.

In the second section the figures and data would be recorded under one of five classes, according as the engine came under the head of factory driving, pumping, locomotives (*a*) in shop, (*b*) on the road, electricity generation, marine engines.

Under the first section a simple expression of efficiency could be employed, based on the amount of heat used per gross or net horse-power per unit of time. Such a section would present the results of a coal test if such were made, in the shape of weight of coal burned and all the results deduced therefrom. Under the head of pumping the duty could be expressed in foot-pounds of duty per million heat-units. Freed from the friction of long mains, the pumping engine is a simple machine to measure, or even then the use of pressure gauges will enable resistance to be measured. Indeed, it may be recorded continuously. Locomotives would be reported as per the consumption of coal per dynamometer pull, a standard coal being employed.

Electric engines would be reported on the basis of quantity and intensity of current generated, the electrical H.P. generated, and the generator efficiency, and, on railway work, the current delivered to the motors; this, to us, however, seeming to be somewhat external to the steam engineer, as also does the item, in marine engine tests, of tonnage moved a given distance per power unit, a matter depending rather upon the build and fineness of the ship than on any quality of its engines.

As to obtaining the results, one of the most important is the work performed by the steam. Mr. Barrus rightly lays stress on the importance of the indicator, and in a system of standardising, he would have the calibration of springs, the operation of the instrument, the method of diagram measurement, all determined and placed on a uniform basis. Much depends on the placing of an indicator; there are no accepted methods of calibrating springs, and so on, to which we might add that of equal importance are brake strap details, the comparison of the brake and the indicator being essential to a determination of engine mechanism efficiency. Mr. Barrus desires to set the ball rolling, and suggests a committee of investigation to place the subject on a firm basis.

REVIEWS.

Automobiles sur Rails. By G. Dumont. Paris: Gautier-Villars et Fils.

This is a little book on tramway motors or automatic vehicles. It is a brief description of the various kinds of mechanical tramway motors. The importance of tramway traction is apparent when it is known that in Paris the annual journeys per inhabitant were 50 in 1856 and had mounted to 155 in 1891. One of the earliest motors was that constructed in 1838 or 1840 by Andraud and Tessié. It was furnished with a compressed air engine and carried eight persons. This worked successfully at Chaillot, but never came to a practical success.

In 1848 a steam motor carrying 60 passengers ran at Bristol. In 1859 the first steam trams were run in the United States. After that progress became more marked. At the present time there are seven types of tramway motor, viz, steam, compressed air, gas engines, carbonic acid, ammonia motors, cables and electricity.

The different systems are described, and a distinction is drawn between systems self-contained and systems in which power is transmitted from a centre. In the Rowan system of steam car the four-wheeled truck which carries the engine and boiler is placed under one end of a car of which the other end is carried by a single pair of wheels, the combination taking curves easily.

The motor truck can readily be detached from the rest of the vehicle and replaced by a similar truck, a convenience for repairs, &c. Various other steam systems are described, including that of Lamm et Francq, which has no furnace, but works from a store of highly heated water. The Mekarski and other air systems are briefly noted, also the Lührig system of gas power, of which we seem to hear so very little from its installation at Blackpool.

Carbonic acid motors are worked by carbonic acid compressed to 75 atmospheres. It is worked in cylinders of 0·10 in. diameter × 0·15 stroke (say 4 inches × 6 inches) with Corliss valves, and reheating by a gas flame is effected near the point of admission. The consumption of gas is given as 4½ kilos. per H.P. day of 24 hours, or 190 grms. per H.P. hour. Liquified gas costs 0·37 fr. per kilo. The cost is 0·07 fr. per H.P. hour.

Ammonia motors, first proposed in 1821 by Gurney, are worked by compressed anhydrous ammonia, which liquifies at about—34° C., or at 27° C., if under ten or a dozen atmospheres. The exhaust ammonia is taken up by water which absorbs 1,700 times its volume of ammonia, and the combination develops heat which is employed to heat the compressed ammonia. In 1896, there was put in service, on 22nd Street, New York, motors of 50 H.P. with 75 atmospheres pressure. The consumption of ammonia was 13·6 lbs. with single, and 27·2 lbs. with double gear, the expense being 0·03 fr. per car kilometre plus 0·044 fr. for fuel at the compressing station.

In the electric section various conduits are illustrated in a diagrammatic manner. We observe that the illustration of the Holroyd Smith conduit is placed upside down. Generally the illustrations are too small. A bibliography is appended. Largely historical, the book is by no means a full technical hand-book of tramway motors, but is useful in gathering between two covers a good deal of information as to what has been effected in the way of mechanical traction by other means than electricity as well as by the latter agent.

Radiography and the X Rays, in Practice and Theory, with Constructional and Manipulatory Details. By S. R. Bottone. Whittaker & Co., London. Price 3s.

Mr. Bottone's little volume will be of great use to amateurs and others commencing the practice of work with the Röntgen rays. Mr. Bottone himself has evidently done a good deal of work in this field, and has designed and constructed a good deal of the apparatus. Those who are not in a position to purchase induction coils and influence machines from the makers will here find instructions sufficient to enable them to make very decent instruments for themselves. Mr. Bottone is evidently an enthusiastic believer in the influence machine, and especially in the Wimshurst machine, as a source of current for exciting the Röntgen tube. In this respect we think his enthusiasm carries him too far. Unless influence machines of a very large size are used, the time of the exposure necessary to produce a good photograph is inconveniently long. For screen work the influence machine is superior, on account of the greater uniformity of its discharge. Moreover, Mr. Bottone would lead us to believe that the Wimshurst machine is superior to the Holtz for X ray work; but if he makes comparative exposures with a Wimshurst and Holtz of equally good construction, he will, we reckon, soon convince himself of his error.

When Mr. Bottone drops into theory we do not find him quite so reliable a guide as in the manipulatory department of his subject. He tells us (p. 17) that the undulations inside the Crookes tube have the property of attracting light bodies—a statement which would be distinctly misleading to the beginner, seeing that it is now well known that these effects are due to electric charges which accumulate on the walls of the tube. He also repeats an assertion, which though made some time ago by a great authority, has since been completely disproved, viz., that the electric conductivity of bodies such as ebonite and paraffin is increased by the action of the Röntgen rays. A serious blunder, which no doubt is due to an oversight, is made at p. 165, where it is asserted that by introducing self-induction coils into a circuit we shorten electric waves and quicken the oscillation: the very opposite is the case.

CORRESPONDENCE.

Visual Telegraphy; or, Seeing by Wire.

With reference to the correspondence on the above question, which has been prominently brought forward by the recent announcement of Herr Szczepanik's (of Vienna) invention, may I be allowed to say just a few words.

As to Herr Szczepanik's invention, I, like many others, doubt if it could be brought into successful application, as the speed at which the revolving mirrors would have to work would be impracticable, at least, without serious breakdowns; and besides, the apparatus as a whole looks very cumbersome in spite of its novelty. As to the practicability of "Visual Telegraphy; or, Seeing by Wire," I have strong hopes of its possibility of solution, but the difficulties in connection with it are chiefly mechanical. Selenium cells and revolving mirrors will have to be superseded by something more sensitive and constant in action. I have some ideas how I think it could be accomplished with, and which I drew up some time ago, and which I expect to be able to put into practical effect ere this time 12 months, and which, as I anticipate, if successful, would bring distant views into drawing rooms, offices, and palaces of varieties, &c. The receiver will be able to see the transmitter; the ladies in the parlour would be able to hear and see the acts and plays in the theatre, &c., without moving out of their doors; and subscribers will be able to ring themselves up in connection with any place of amusement. Notable scenes such as the late Mr. Gladstone's funeral or the Queen's Jubilee procession, will be able to be rung up into the large halls in the provincial towns for reproduction on large screens. As to what the fundamental principles of my ideas are, it would not be wise on my part to disclose them at present, as some wise individual may try to forestal me, but I am quite confident of success in the near future. There is one fact in connection with this subject, and that is, we know very little as yet of the actions and ways of light waves when conducted electrically. Some say that visual telegraphy is impossible, and some say it may be possible, but time and experiment alone will tell.

Thanking you for your kind insertion of this letter,

Geo. Smith.

June 20th.

ELECTRIC LIGHTING AND REFUSE DESTRUCTION IN BERMONDSEY.

Another Sanguine Report.

The Bermondsey Vestry on Monday evening considered a very lengthy report from Messrs. Kincaid, Waller & Manville, on the advisability of erecting a refuse destructor in conjunction with the projected electric light station. As the subject is of considerable interest at the moment, we make no apology for giving the following abstract of the report in question:—

Report of Consulting Engineers.

Referring to our report of June 26th, 1897, in which we pointed out that having consideration of the fact that at the time this report was made the cost of disposing of your house refuse was only about 1s. 2d. per ton, whilst the cost of burning it in a destructor would be more than 1s. 10d. per ton, and that under those circumstances we did not imagine that you would care to have your system of disposal of the ash-bin refuse changed, we have, in accordance with your instructions given us through Mr. Ryall, your vestry clerk, reconsidered the matter, after having consulted thereon with Mr. Sumner, the surveyor to the Vestry.

From the information that gentleman has been good enough to give us, it now appears that the cost of disposing of the ash-bin refuse is as much as 1s. 8d. per ton, and in your case, as in the case of all other London vestries, this cost of disposal of your ash-bin refuse by carting away or barging away, is likely to increase rather than to diminish.

It also appears that if a site in the vicinity of the Vestry Hall could be secured for the erection of a combined dust destructor and electric generating station, the heat produced by the combustion of the ash-bin refuse might be economically utilised for heating the baths' water, &c., and working the machinery used in the baths and washhouses, with a consequent additional saving that would be effected by the utilisation of this heat for the production of electrical power also.

We have reconsidered the matter on these new bases, and beg to append estimates, which, we trust, will put the financial position produced before you clearly.

The estimates submitted show (1) that the capital cost of additional works incidental to a six-cell destructor, to deal with 11,711 tons of refuse per annum, would amount to £10,000; (2) that the annual maintenance would be 2s. 4d. per ton of refuse, or a total of £1,359; and (3) the saving and revenue to £1,170 per annum, leaving a deficiency of £189. Against this would be set the present cost of £975 incurred in disposing of 11,711 tons of house and trade refuse at 1s. 8d. per ton, leaving an estimated net saving of £786 per annum.

After detailing the manner in which the above figures have been arrived at, the report proceeds:—

In the estimate of annual maintenance, we have taken the labour and superintendence on the basis of the destructor only being run six days in the week in place of seven, enabling you to work two shifts a day only. We have taken the cost of the removal of the clinker at 1s. 10d. per ton of clinker removed. (In this figure we do not quite agree with Mr. Sumner, who has estimated the cost of this, including both carting and tipping, at 2s. 8d. per ton). From our actual experience at Shoreditch, however, where the cost of removing clinker must be at least as great as in any other part of London, and where only 1s. 10d. per ton is paid for this service, we have no hesitation in expressing an opinion that you will be able to dispose of such of your clinker as you require to have removed for no greater charge than this. The amount of clinker is arrived at on the assumption that only 25 per cent. of the refuse burnt will be produced as clinker. At Shoreditch the percentage of clinker is about 30 per cent., but there can be little doubt that the refuse at Bermondsey is richer in combustible material than at Shoreditch, and we have therefore taken 25 per cent. as the residue. Of this 25 per cent., it is estimated by Mr. Sumner that one-third can be utilised for the purposes of the parish.

We, therefore, believe that this inclusive estimate of maintenance for the burning of refuse, amounting to about 2s. 4d. per ton, is one that can be worked to in practice.

The saving and revenue per annum takes the credit for the steam which may be utilised for the baths heating purposes, and also supplying power there, which at present consumes coal to the value of £431 19s. per annum. We have allowed in this estimate, as a debit to this item, the interest and sinking fund on £1,000, which sum it might be wise to spend in providing apparatus to enable the baths to be heated by the utilisation of the exhaust steam from the electric light engines, in place of using live steam from the boilers for this purpose; for you must bear in mind, that for all heating purposes, where the water is not required to be raised above boiling temperature, exhaust steam is practically as useful as live steam, leaving only live steam to be used for the actual boiling in the washing troughs. Credit is taken for one-third of the clinker produced at 2s. per ton. This price, Mr. Sumner estimates it will be worth for other parish purposes. There is a credit for 2,180 tons of combustible trade refuse which we have taken at 2s. 6d. per ton, but which is included in Mr. Sumner's figures at only 1s. 8d. per ton. Here, again, we feel sure, from our experience at Shoreditch, that at least 2s. 6d. per ton can be obtained for the burning of trade refuse on the average.

Then comes the estimate of coal saved in the electric generating station, which is calculated on the basis of the destructor running only 6 days per week, coal being used on Sunday. We have no hesitation in stating definitely that the 11,000 tons of refuse you have to burn will produce all the power required for the plant you are proposing to put down in the first instance in your station, as the proportional amount of power produced at Shoreditch per ton of refuse is greater than this, notwithstanding that probably their refuse has a smaller calorific value than that at Bermondsey.

Finally, you must bear in mind that during a great portion of the day the live steam produced by the dust destructor will not be utilised, as the electric generating station will then be producing but a small output, unless a day load is found in the shape of a supply of current for motive power purposes.

The financial statement shows you that under these estimates a net saving of £786 15s. 4d. per annum will probably be made on the combination of a dust destructor with the electric generating station and baths, which is so considerable an amount as to cover all contingencies and still leave a certainty of a considerable annual saving being made, whilst, on the other hand, you will be sure that the price of disposing of the refuse will remain a constant quantity year by year.

Mr. Cox, chairman of the Electric Lighting Committee, formally recommended that, in the event of the Bill being passed confirming the Vestry's provisional order, the report of Messrs. Kincaid, Waller and Manville should be adopted, and a refuse destructor erected with the electric lighting station. After some discussion the recommendation was unanimously agreed to.

LONDON COUNTY COUNCIL.

At the weekly meeting on Tuesday, the Council approved a loan of £2,950 to the Vestry of Islington for the purpose of acquiring the fee simple and subsidiary interest in six houses in order to enlarge the electric light station in Eden Grove.

Forthcoming Boiler Contract.

It was resolved, on the recommendation of the Main Drainage Committee, to invite tenders for the supply of four high-pressure Lancashire boilers to work at 150 lbs. pressure for the Western pumping station.

Lighting of Theatres.

The Theatres Committee reported that the requirements of the Council in regard to electric lighting arrangements have been carried out at the following places:—Adelphi Theatre, Strand; London Music Hall, 95 to 99, Shoreditch High Street; Royal Cambridge Music Hall, 136, Commercial Street, Whitechapel; Salle Erard, 18, Great Marlborough Street; and Standard Theatre, Shoreditch High Street.

New Central Station.

The Building Act Committee announced that they had conditionally approved the plans submitted with the application of Messrs. Kincaid, Waller and Manville on behalf of the South London Electric Supply Corporation, for the construction of a generating station and works on a site adjoining Bengeworth Road, Loughborough Junction, and authorised the erection of the generating station and works as shown upon the plans.

Electric Lighting Provisional Orders.

The Highways Committee, reporting upon the provisional orders considered during the 1898 session, said:—Of the 11 provisional orders applied for this session, the Board of Trade has granted only four, namely, those applied for by the Vestries of Bermondsey and St. Marylebone in respect of their respective parishes, and an order each to the Charing Cross and Strand Electricity Supply Corporation and the County of London and Brush Provincial Electric Lighting Company in respect of portions of the Holborn and St. Giles districts. The Board has adopted many of the amendments suggested on behalf of the Council; but as we have reported to the Council, has declined to insert the suggested clause for the protection of the Council's tramways. The limit of price in the companies' orders has been reduced to 7d. per unit, but in that of the Vestries the price is as in previous orders, 8d.; in the companies' orders the provision as to continuous current has been omitted, but it has been inserted in the Vestry orders, from which, moreover, the clause enabling the undertaking to be transferred to a company has been struck out. Two or three of the suggested amendments, which have not been adopted by the Board, we consider of some importance; and we are endeavouring to induce the Board to insert them, but the Council has obtained substantially the principal amendments for which it asked.

In a further report the Committee stated that the Board of Trade has intimated that with regard to the power of purchase by local authorities, it has not been the practice of the Board to vary the term of the years prescribed by Section 2 of the Electric Lighting Act, 1888, except in special cases, at the request of the local authorities and with the concurrence of the promoters, and that, as in the case of these orders, no request has been made by the local authorities concerned for a variation of the term, the Board is unable to concur with the suggestion that the term should be seven years; and that the Board proposes to take the necessary steps to secure the insertion in the No. 2 Order of the other amendments suggested by the Council.

ELECTRIC SUPPLY IN BULK.

Reporting on the recent conference with London local authorities on the telephone service and generating stations for the supply of electrical energy in various districts, the Highways Committee referred as follows to the latter question:—

"The object of the Central Electric Supply Company's Bill, deposited this session, is to enable the company to supply electrical energy in bulk to local authorities and companies authorised to supply in the areas defined in their respective orders under the Electric Lighting Acts, and for this purpose to acquire lands compulsorily and to erect and maintain generating stations thereon. Power is also sought to break up streets for the purpose of laying what may be termed trunk mains from the generating stations to the point at which the energy is to be distributed by the receiving local authority or company. Thus the streets under the jurisdiction of one or more local authorities may have to be disturbed in order to afford the supply in bulk to a local authority or company at some distance from the source of supply. This is shown clearly by clause 8 of the Bill which proposes that the company shall have power to break up streets and to lay electric lines and place boxes and apparatus for all purposes of electrical supply, and 'do all other acts which they (the company) may deem necessary for supplying electrical energy to any company, body, or person, authorised to generate or supply, or generating or supplying, such energy for any public or private purpose within the County of London, and may supply such energy accordingly.'"

"The Chelsea Electricity Supply Company's Bill is to empower the company to take lands in the parish for the erection of generating stations, for use in connection with the supply of electrical energy in the area under the company's order; and the Metropolitan Electric Supply Company's Bill has two main objects, viz—(a) to authorise the company to hold certain lands, recently acquired by the company, at Acton and Willesden for the erection of generating stations to supply districts included in the area of supply under the orders granted to the company; and (b) to authorise the company to lay down cables and other necessary apparatus from the generating station to the company's station at Amberley Road, in the parish of Paddington. The Bill provides, however (clause 9), that the consent of any local authority, through whose district it may be necessary to lay mains, shall be obtained before the mains are laid. The effect of the clause, as drawn, would appear to be to repeal the provisions of the company's orders which forbid supply beyond the areas defined therein.

"The proposals in these several Bills form a new departure; the policy hitherto pursued having been, in view of the ultimate purchase by the local authority of each undertaking authorised by an order granted to a company, to provide that the whole of the undertaking, including the generating station, should be within the area of supply."

The Committee then proceeded to refer to the appointment of the Parliamentary Committee and to its conclusions, and mentioned that they proposed to report to the Council again on the subject, in the meantime giving the text of the resolutions passed at the Conference of local authorities held last week.

BUSINESS NOTICES, &c.

Announcement.—Messrs. A. & W. Hopkins state that they have taken Mr. Montague H. Galsworthy in as partner in their fittings manufactory carried on at 7, Hill's place, Oxford Circus, W., and that the business will in future be carried on under the name of "The London Electrical Fittings Co.," and under the same management as at present. The accessories supply business will be carried on as heretofore, under the name of A. & W. Hopkins, at 30, Parliament Street, Westminster, S.W.

Annual Outing.—The Aberdeen Electricity Works' staff went for their annual outing to Benachie.

Arc Lighting.—Mr. G. Braulik, of Upper Thames Street, E.C., informs us that Messrs. Korting & Mathiesen now manufacture a continuous current arc lamp which burns three in series on 110 volts with resistance.

The Ariel Arc Lamp Syndicate, Limited.—In the Chancery Division of the High Court of Justice on Wednesday, June 22nd, Mr. Justice Byrne made a compulsory order winding up this company, on the petition of Mr. J. Jones and others.

Books Received.—"A Text-Book of Zoology," by H. G. Wells and A. M. Davies. Published by W. B. Clive, University Correspondence College Press, London. 6s. 6d.

"Electrical Testing for Telegraph Engineers." By J. Elton Young, M.I.E.E. *Electrician* Printing and Publishing Company, Limited, London. 10s. 6d.

The General Power Distributing Company's Bill.—A Select Committee of the House of Lords, presided over by the Earl of Northbrook, on Tuesday entered upon the consideration of the scheme of the General Power Distributing Company Bill, the object of which is to enable the company to supply electricity for lighting, traction, and other purposes to a district embracing an area of 2,000 square miles, including the towns of Sheffield, Rotherham, Lincoln, Gainsborough, Newark, Nottingham, Ilkeston, and Worksop. The central generating station is to be at Worksop, in the midst of a colliery district, and the promoters state that by the use of coal slack for generating purposes, which they will be able to procure at 2s. per ton, they will be able to produce electrical energy at an extremely cheap rate. In view of the large average demand which they hope to develop in the area of supply, they expect to be able to sell electricity at 1d. or 1½d. per unit, whereas the present charge in Notts, where the electric lighting undertaking is in the hands of the Corporation, is 4d., having been reduced from 6d. to 4d. since the Bill was introduced. The measure is opposed by a large number of local authorities, including the Town Councils of Sheffield and Nottingham, but it is supported by a numerous body of traders in the district. Over 70 petitions have been presented in its favour. The case was opened, says the *Times*, by Mr. Pember, Q.C., for the promoters, and among the witnesses called in support of the Bill were Mr. Bainbridge, M.P., Mr. Lupton, C.E., and a representative of the Nottingham Chamber of Commerce.

The Committee on Wednesday heard further evidence in support of the proposal. The Duke of Newcastle said that if the scheme were carried out he would employ electricity for the lighting of Clumber and for other purposes. The Duke admitted that the Corporation of Nottingham had lately put down mains to supply his estate in the city of Nottingham with electricity under an agreement, but he would prefer to have two strings to his bow, so that his tenants might have the advantage of a cheap supply. Mr. Thomas Bayley, M.P., also gave evidence in support of the scheme, which would benefit the mining and agricultural interests in the Chesterfield Division of Derbyshire.

Changes of Address.—The Wheeler Condenser and Engineering Company have found it necessary to extend their office accommodation, and have taken new premises at 171, Queen Victoria Street, E.C.

The Blake & Knowles Steam Pump Works, Limited, have found it necessary to remove from 117, Queen Victoria Street, to larger premises at 179, Queen Victoria Street.

Conduit Wiring.—The Simplex Steel Conduit Company, Limited, of Birmingham, who, as stated in our issue for May 27th, have published lists describing their "ideal" method of wiring for lighting and other electrical work, have sent us some samples of tubing, T junction bends, and elbows used in their system, which, upon examination, appear to be well made of light enamelled steel tubing. It is claimed that the Simplex conduit affords complete mechanical protection, and preserves the insulating property of the dielectric in a highly efficient state, enabling the circuits to be drawn in and out of the conduits with ease and freedom, and without possibility of abrasion. The process of enamelling renders the tubes and fittings very durable, impervious to rust and consequent depreciation, and is claimed to give them a perfectly smooth exterior and interior insulating coating. The accessories have been designed to meet the requirements of concealed and surface work. It is claimed that a wireman of average intelligence would find no difficulty in erection, as no screwed couplings are used, and consequently, no special tools are required. Mr. L. M. Waterhouse, A.I.E.E., is the company's engineer and manager.

Dividend.—Messrs. Schuckert & Co., of Nurembourg, is declaring a dividend of 14 per cent. for the past financial year.

Electric Cabs.—We understand that a contract has been given to the Gloucester Railway Carriage and Waggon Company, Limited, by the London Electrical Cab Company, Limited, of Lambeth, for the building of a number of their cabs.

Electric Lighting in Chili.—Die Electricitäts Gesellschaft Santiago-Chili is the title of a company which has just been formed in Berlin, with a capital of £1,200,000. The Allgemeine Electricitäts Gesellschaft and Messrs. Ludwig Löwe & Co. are interested in the new undertaking.

Electrical Progress in Milan.—Our Consul, in his annual report, remarks that although electric traction has not yet been applied to all the tramway lines in Milan, the first year's working under the new arrangement has resulted in a net profit for the municipality of £38,000, as compared with about £14,000 under the old system, and it seems probable that the current year will give even more satisfactory results. In the course of the next few months the Edison Company, which works the electric tramways on account of the municipality, will bring into Milan a force of nearly 10,000 H.P., obtained from the River Adda, at Paderno. Six turbines, each of 2,160 H.P., with a seventh as a reserve in case of accidents, will be employed for developing the water-power, and conveying it to the dynamos, which will be seven in number, and the electric current will be carried from Paderno to Milan, a distance of 20 miles across country, by means of overhead wires. These turbines are said to be the most powerful hitherto in use in Europe, and are being constructed by the local firm of Riva, Monneret & Co. It is estimated that the loss of power in transit will not exceed 9 per cent. Of the nearly 13,000 H.P. to be thus developed, 2,000 are already disposed of in the town of Monza. The remainder will be brought to Milan, and any surplus that may remain after providing for the public and private lighting of the city, and the working of the tramways, will be let for industrial purposes. In 1897 the Edison Company increased its capital from £360,000 to £540,000. It has just declared a dividend for last year of 6 per cent. The use of electricity, both for lighting and motive power purposes, is constantly extending, and there is consequently an ever-increasing demand for all kinds of electrical appliances. Some of these are now made in Italy, but by far the greater part come from Switzerland and Germany, two countries which appear to have made this industry, which has undoubtedly a splendid future before it, quite a speciality of their own, and they must find it a very profitable one. *British engineering firms, it is stated, do not seem to be making any effort to secure a share of this business in Italy.*

Exhibition.—At the Royal Agricultural show, which closes to-day at Birmingham, Messrs. John Fowler & Co. (Leeds), Limited, have been exhibiting a variety of agricultural traction engines, road locomotives, and other light railway plant, &c.

Messrs. Ruston, Proctor & Co., Limited, of Lincoln, are also exhibiting at Birmingham a number of prize steam engines and machines, including the Ruston oil engine.

Fire.—A fire of a very destructive character broke out at a quarter past one o'clock on Thursday morning last week, causing the destruction of 19 and 21, Heddon Street, Regent Street, W., the premises of Messrs. Davies, Kent & Stewart, manufacturers of electric light supplies, flexible wire, &c. From the first the fire spread rapidly, and Commander Wells, R.N., assisted by Supt. T. Smith, ordered a large force to the scene, and set 19 steamers to work. The firemen had to complain of short supply of water in the early minutes of the fire. A huge telephone derrick on the top of the burning building suddenly collapsed, and the mass of metal, weighing some 40 tons, crashed into the centre of the roadway, but, marvellously enough, no firemen were injured. As announced in another part of this issue, Messrs. Davies, Kent & Stewart have secured premises at 17, Berners Street, W., where all communications should be addressed.

Harvie & Co., Limited, v. Gavin.—In the Glasgow Court of Session on 17th inst., this appeal was heard and judgment given. It was an action raised in the Sheriff Court at Glasgow by Wm. Aloysius Gavin, proprietor of the *Register of Leading Marine Manufacturers*, 57, Gracechurch Street, London, against Wm. Harvie and Co., Limited, electric light engineers, and patent ship lamp manufacturers, 222, Broomielaw, Glasgow. The pursuer sued for £65 as fees due, at the rate of 12s. 6d. per week for 104 weeks, for the insertion of the defender's name in the *Register*. The defenders said that their name was not inserted in the *Register* upon their order; that a representative of the pursuers called upon them, and they agreed to the insertion being made provided no other firm appeared under the head of "Ship Lamps," and that the insertion of the word "Scottish," if inserted in the order before the word "firm," was inserted in breach of the agreement. The pursuers, in reply, said that the addition to the condition was made by arrangement with Mr. Harvie, and was read over by Mr. Harvie's manager before he signed it. Sheriff Substitute Guthrie gave decree for £61, to which the sum sued for had been restricted, and found the pursuers entitled to expenses. Their Lordships of the Second Division affirmed the decision of the Sheriff Substitute, with additional expenses.

List.—The Phaeton Electrical Company, Limited, of Watling Street, E.C., have issued Section No. 1 list, in which they illustrate and give prices of ordinary incandescent lamps, 16 different types of usual caps being shown. A variety of special lamps, such as etched, silvered, coloured, tubular, battery, miniature, Phaeton sun ray and surgical lamps, also improved Phaeton lamps without plaster of Paris, are all included in the list.

Municipal Electrical Association.—On Friday, the 10th inst., a party of the members of the above Association visited the works of the Incandescent Electric Lamp Company, Limited, and were shown the whole of the operations in the manufacture of the "Robertson" lamp.

The National Company for the Distribution of Electricity by Secondary Generators.—On Wednesday last week, before Mr. Justice Wright, sitting in the Companies' Winding-Up Court, Mr. Rowden mentioned this matter, which is a creditor's petition for winding up the company. The case had been twice before adjourned on the ground that the matters in dispute between the creditor and the company were the subject of litigation before Mr. Justice Sterling. The Chancery action had been set down for trial, and it was hoped would shortly be disposed of, and counsel now applied that the petition should be again adjourned and not dealt with until after the proceedings in the Chancery Division. Mr. Gore Brown opposed the application, and asked that the petition should be dismissed. His Lordship declined to grant any further adjournment, and dismissed the petition.

New Premises.—Mr. R. Needham is about to open premises in Stanley Street, Southport, as an electrical and general engineer.

Overhead Wires.—Mr. G. Stegman, an electrician, of 45, St. John's Hill, has been summoned at the South-West London Police Court at the instance of the Battersea Vestry for placing overhead wires across St. John's Hill, without providing sufficient supports, and without giving notice to the Vestry. Mr. Young, solicitor to the Vestry, stated that, according to the bye-laws, the wire should be supported at every 100 yards. Eventually it was decided to adjourn the case, it being stated that the defendant had agreed to submit plans to the Vestry.

Reynolds & Branson, Limited.—Messrs. Reynolds and Branson, of Leeds, manufacturers of electrical apparatus, have formed themselves into a private limited liability company under the above style. The present partners take the whole of the shares, and retain the direction of the business as formerly.

Ship Lighting.—A complete installation of the electric light has been made on the steamer *Ula*, the latest addition to the fine fleet of the British India Steam Navigation Company's line. The masthead and side lights are also electric, and in connection with these, the builders of the ship, Messrs. William Denny & Bros., of Dumbarton, have fitted a new device called the "Voltometre," which is for the purpose of seeing if the lights are burning properly. In the chart room is a case with three small openings in it. Each opening is provided with differently coloured glasses, the centre being frosted, whilst those to the right and left have green and red glasses respectively, these corresponding to the masthead and starboard and port side lights in colour. When these lights are burning the openings in the case in the chart room are illuminated by incandescent electric lights. If by any means either or all of the lights become extinguished this is at once perceptible in the chart room, the voltometre corresponding with the lights on the mast and sides of the vessel. An alarm bell also rings, and continues to ring until the lights are set right again. Under ordinary conditions it is very difficult to see whether the lights are burning properly, and the new invention, which has been, or is about to be patented, will probably be a very valuable one. This is the first ship on which it has been used. The inventors are Messrs. W. Denny & Bros.

The Swiss Electrical Trust.—The *Financial News* Geneva correspondent says that the great Swiss Electrical Trust, projected for some time past, has now been called into life with a capital of £1,000,000, £600,000 of which has been taken over by the Banque de Paris et des Pays Bas, and the remainder by the Union Financière. It is probable that not only Switzerland, but France, will be included in the field of its operations.

Webster v. the Cox Thermo-Electric Company, Limited.—In this case, which came before Mr. Justice Romer on Saturday (June 18th) on a motion for judgment in default of defence in a debenture-holder's action, his Lordship made the usual order in a debenture-holder's action, and directed the usual inquiries. Counsel stated that the company was incorporated in April, 1896, that the debentures were a series of £500 charged on the undertaking of the company, that no interest had been paid, and that the charge became enforcible on failure to pay interest for one month.

Workmen's Compensation.—In connection with the Workmen's Compensation Act, 1897, which comes into force on July 1st, and also in regard to the Employers' Liability Act of 1880, Messrs. Wallach Bros., of 57, Gracechurch Street, E.C., send us lists of various safety appliances and fittings which have been introduced by them from time to time for the prevention of accidents in factories, &c. The lists describe the "Evertrusty" patent gauge glass protector, described in these columns some time ago, improved automatic belt-lifting apparatus, and the "Evertrusty" nose, throat, and lung protector and respirator, the last mentioned being of particular importance in all factories where workers are likely to come in contact with lead, noxious gases, &c. This article, we understand, has been tested for some time with satisfactory results.

ELECTRIC LIGHTING NOTES.

Accrington.—The Corporation, who already possess electric lighting powers for the borough, recently granted the trustees of the New Jerusalem Church permission to obtain electricity from the local Co-operative Society until such time as the Corporation are in a position to supply it themselves. The installation, which was put in by Mr. Simpson, electrical engineer, of Hapton, was used for the first time on Sunday last.

Alloa.—The Burgh Commissioners have resolved to do nothing meantime regarding the proposal to light the streets by electricity. Baillie Arrol intends moving that the Commissioners apply for a provisional order to protect themselves.

Bedford.—Last week a Local Government Board inquiry was held *re* the Council's proposed loan for £5,400 for electric lighting extensions. The Town Clerk explained the need for the extensions, and the general details were described by the electrical engineer, Mr. Hope-Johnstone. It seems that up to the present time £49,000 has been borrowed for electric lighting purposes. Sanction had been given to borrow £58,650, and, therefore, the Corporation had still power to borrow a further sum of £6,950. The present loan was for the extension of the engine room, with the necessary foundation, transformers, extra testing instruments, mains for public lighting, standards for lighting the market places, &c. This was necessary on account of increased demand, and for the public lighting of the St. Cuthbert's Glebe Estate. The total number of lamps at present was 14,250 8-C.P., exclusive of public lighting, and this scheme included 65 additional lamps for the St. Cuthbert's Estate.

Blackpool.—From a "Blue Book" just issued by the borough treasurer of Blackpool, it appears that the income from the electric lighting undertaking during the last financial year was £14,229, made up as follows:—Public lighting, £3,457; current for tramway traction, £1,286; private lighting, £9,010; rental of meters,

&c., £279; rents and sundry receipts, £197. During the same period the expenditure was £8,080, namely:—Generating current, £5,521; distribution, £468; public lighting, £928; rents, rates, and taxes, £255; salaries, management, expenses, &c., £908. The gross profit was £6,149, which, less loan charges £4,734, left a net profit of £1,415, against an estimated profit of £1,300. The balance was carried to the credit of the general district rate account. In 1896-7 there was a net profit of £828, and in the year before £281, whilst the two first years' working was at a loss. The units generated last year were 903,558, against 575,904 in the preceding 12 months, this being an increase of nearly 57 per cent. There are now about 50 miles of electric lighting mains, and the capital outlay last year amounted to £16,085.

Bournemouth.—The Town Clerk is to write to the Board of Trade on the subject of the proposed appointment of an electric inspector. The Council has decided to reconstruct the electric call-bell system at the three fire stations, and £225 is to be borrowed for the purpose.

Distillery Lighting.—The Mortlach Distillery, Dufftown, is to be lighted by electricity, water-power available in the neighbourhood being utilised. 150 lamps will be fitted up. Messrs. P. O. Middleton & Co., of Aberdeen, will carry out the works.

Cheltenham.—H.M. Inspectors of the Education Department having recommended that the class rooms and dormitories occupied by the students of the Cheltenham Training Colleges be lighted by electricity, the governing body of the Training Colleges has decided on wiring up the college for masters situated in Swinton Road, Cheltenham, during the summer holidays. The local borough electrical engineer (Mr. H. Kilgour) has drawn up specifications, and will supervise the work.

Chester.—The Council has authorised the Lighting Committee to have arc mains and distributing mains laid for the supply of public and private electric lighting in George Street, St. Anne Street, and adjoining streets at an estimated cost, including street lamps, &c., of £1,260.

Crossgates.—A recent meeting of the Hill of Beath inhabitants resolved in favour of public electric lighting.

Dublin.—A special meeting of the Corporation was held last Friday to consider the report of the committee of the whole house in reference to the tenders for the supply, laying down, and maintenance of electric mains and apparatus, in connection with the loan of £20,000. The report of the committee of the whole house stated that the tenders received by the Electric Lighting Committee in response to the advertisements issued were submitted to Prof. Kennedy, whose views on them were set forth in an exhaustive report, and carefully considered. Certain tenders were recommended for acceptance—namely, those which had been approved of by Prof. Kennedy—and the committee of the whole house adopted the recommendation of the Lighting Committee, and decided to act on it without delay. They submitted the following recommendations for the approval of the Council:—That the tender of the Callender Cable and Construction Company, for the supply and laying down of concentric cables, be accepted for the sum of £12,505 13s 2d., the company binding themselves to maintain the whole of the concentric mains, together with the boxes and accessories as supplied and laid by them for a period of 12 months free of cost to the Corporation. That the offer of the same firm to maintain the cables for a further period of 10 years, on consideration of an annual payment to them by the Corporation at the rate of 10s. per £100, or ½ per cent. on the invoiced value of the work, be also accepted. That either of the following tenders for transformers be accepted, viz.:—Tender of Messrs. Johnson & Phillips, amount £2,996, with the addition of £100, approximately, for cartage and fitting up; tender of the British Thomson-Houston Company, amount £3,340 11s. 3d., subject to the receipt in the meantime from that firm of a satisfactory telegram as to the delivery of the transformers within a specified time. Alderman Meade said the matter had been very carefully considered by the Electric Lighting Committee, who were thoroughly conversant with the urgent necessity there is for having the contract accepted, and the work placed in hand at once. It was absolutely necessary that new cables should be put in, and that the contractors should be urged to go on with the work with all speed, so that the contract would be completed for the coming winter lighting. A committee of the whole house had considered the acceptance of tenders, and they determined that the citizens of Dublin should get the best cables that could possibly be got, and that they should cost the lowest possible price. They applied for tenders, and the result of their deliberations, with the assistance of the borough surveyor and Prof. Kennedy, was a recommendation that the tender of the Callender Cable and Construction Company, at the sum of £12,505 13s. 2d., should be accepted. He believed that the cables of this company were the best possible value that could be obtained for the citizens of Dublin. Furthermore, he was informed that these were the cables which the Board of Trade would require to be used in Dublin, because the engineer of the Board of Trade in London had called on Prof. Kennedy, and told him that these concentric cables of the Callender Company should be used, and he even went so far as to say that this would be one of the conditions which the Local Government Board here would put on the Corporation before they allowed them any loans. He moved:—"That the tender of the Callender Cable and Construction Company, for the supply and laying down of concentric cables, be accepted for the sum of £12,505 13s. 2d., the company binding themselves to maintain the whole of the concentric mains, together with the boxes and accessories as supplied and laid by them for a period of 12 months free of cost to the Corporation. That the offer of the same firm to maintain the cables for a further period of 10 years, on consideration of an annual payment to them by the Corporation at the rate of 10s. per £100, or ½ per cent. on the invoiced value of the work, be also accepted; and that the law agent be instructed to prepare the necessary contract." The Callender Company, Alderman Meade continued, had undertaken to complete the work within 18 weeks, while none of the other companies who tendered would engage to complete it within 26 weeks. The question of time in this matter would mean a great deal to the Corporation and the citizens.—Alderman Sir Robert Sexton, in seconding the motion, referred to the saving of time as a most important matter. Although there was a lower tender than that of the Callender Company, the saving of time would considerably make up for the difference of cost.—The resolution was unanimously adopted.—Alderman Meade then moved that the tender of Messrs. Johnson & Phillips for transformers, amounting to £2,996, with the addition of £100 approximately for cartage and fitting up, be accepted. The firm guaranteed delivery within a specified time. The resolution was carried.

Dundee.—At last week's Town Council meeting Treasurer Ritchie submitted the annual report of the gas and electricity departments. In regard to the electricity accounts, the estimated revenue was £6,000; the actual, £6,269 13s. 8d.; leaving a surplus of £269 13s. 8d. The estimated expenditure was £5,284 6s. 7d., the actual being £4,941 9s. 5d., showing a gain of £342 17s. 2d. Adding these two items, the balance of income over expenditure is £612 10s. 10d. Added to a surplus of £715 odd, this made a balance of £1,328 to carry forward. The estimates of the same department for next year, including the large balance of £1,328 4s. 3d. mentioned, less a charge of £381 6s. 7d., the remaining balance due to the gas department, amounts to £7,553 17s. 8d., and the expenditure £7,039 6s. 7d., showing an estimated surplus of £514 11s. 1d. In the year's expenditure provision has been made for a contribution of £1,000 towards the formation of a contingent fund. The Committee advised the reduction of charges for current from 4½d. to 4d. per unit for lighting, and 2½d. per unit for motor purposes. The accounts were criticised by Mr. Brownlee, who thought £1,000 was far too large to devote to a contingent fund, and they were then adopted.

Ealing.—In further reference to the alleged trouble among the electricity works' staff, the Electric Lighting Committee issued a report on its investigations into the affair last week. The report, which recommended that Mr. Recano's resignation be accepted, that Mr. Bush be asked to resign, and that Mr. Saunders should be re-instated, was adopted.

Epsom.—The Urban Council are now issuing a tender for lighting 207 public lights in their district. The advertisement is a formality, as the gas company alone tender; but in the near future the light is expected to be altered, as the Council have purchased a site for erecting public offices, electric lighting station, &c., and have, it is understood, consulted an electrical engineer on the matter.

Glasgow.—Last week at the Corporation meeting, Mr. Maclay, in moving the approval of the minutes of the Electricity Committee, stated that the Committee had now placed the contract for the excavation and concrete work for the electric station at Port Dundas, as well as the contract for the mason work at Pollokshaws. They were resolved to push on the erection of these works without delay.

Last week the Watching and Lighting Committee recommended the Corporation to have 218 gas lamp pillars removed from streets which are now lighted electrically.

Glossop.—Last week a special meeting of the Council was held to consider an electric lighting scheme for the borough. Captain Partington, J.P., chairman of the sub-committee, brought up a report which stated that the scheme submitted comprised an electric station and works on a site adjacent to the Glossop iron foundry, from which centre electric light would be supplied to the whole borough. The cost of working, maintenance, rent of site, and the redemption and interest of the capital would amount to about £1,975 per annum, and the income would be about £2,000, which would give a clear margin of £25 profit. The capital estimated to be expended is about £15,000. Capt. Partington thought they were not justified in spending the money until they were sure they would have enough consumers. It was resolved to adjourn the matter until 29th inst., and in the meantime, a canvass is being made of the district.

Godalming.—The Local Government Board has refused its sanction to the loan of £15,000 asked for by the Town Council for electric lighting purposes. As there was much opposition to the scheme, it is stated that the Board thought it was doubtful whether it could prove remunerative, or even self-supporting, particularly in view of the smallness of the compulsory area. The Council has yet to consider the letter, but the Mayor has expressed an opinion that a poll of the residents will be taken.

Hastings.—After going fully into the matter of the appointment of an electrical expert to report upon the Hastings Electric Light Company's undertaking, the Public Lighting Committee withdrew their proposal to appoint Mr. Grenville, and recommended that Prof. Hy. Robinson be appointed to make the report. This was agreed to by the Council by 19 votes to 1. The Council has approved of the company's proposals to extend mains in a number of roads.

Keith.—The Aultmore-Glenlivet Company, Keith, have just decided to introduce the electric light at their fine new distillery at Forgie. Paraffin is used for lighting purposes at present, and besides being unsatisfactory so far as the light is concerned, is also highly dangerous when the inflammable nature of many parts of the distillery are considered.

Kensington.—The Vestry last week had a discussion on electrical matters, and appointed a Committee to consider the report of the Select Parliamentary Committee. The Vestry has allowed the House-to-House Electric Light Company to erect a trial arc lamp in Kensington Road.

Killarney.—The Killarney Union is unable to find out what profit is being made by the Killarney Electric Lighting Company. The matter was discussed last week, and a resolution was passed drawing the attention of various Members of Parliament and others to the question.

Leeds.—The Bill to confirm the provisional orders granted by the Local Government Board to the Corporation of Leeds for power to create sufficient stock to acquire the undertaking of the Yorkshire House-to-House Electricity Company having been referred to a Select Committee, objection has been taken, on behalf of the Corporation, to the right of the electricity company to be heard before the Committee. The question will, therefore, have to be decided by the Court of Referees.

Leith.—The work of laying mains is being rapidly proceeded with. A sub-committee has been planning the positions for the public lamps. Brackets will be used in Kirkgate.

Liverpool.—The Corporation Bill was before the Parliamentary Committee last week, and the clause asking for power to borrow £200,000 for electric lighting purposes. The Town Clerk pointed out that under the Electric Lighting Act and a provisional order, they were under certain conditions obliged to give a supply to anybody in Liverpool who was entitled to receive it, and to give it up to the required quantity. They could not do that without spending capital, and they could not spend capital without the sanction of the Local Government Board.—Replying to Mr. Hutton, Mr. Fitzgerald and the witness said there were precedents for this clause.—The Town Clerk, answering Mr. Fitzgerald, said it would not be possible to submit a detailed estimate for electric lighting purposes, because in such matters as mains they never knew where they were from day to day.—Mr. Fitzgerald said what was proposed was exactly what was done in Bills relating to gas and water undertakings; they produced a lump and not a detailed estimate. At the present time the Corporation had only £556,355 authorised borrowing powers, and, with the estimated capital expenditure of the present year, the expenditure would be £660,355, and further capital powers were therefore very necessary.—The Chairman intimated that the committee were by a majority against giving the power sought by the clause.—Mr. Fitzgerald asked the committee to give the Corporation sufficient powers, at any rate, to carry them over the present year.—After consultation with his colleagues, the Chairman announced that the committee could not grant the powers which related to electric lighting.

Llandrindod Wells.—The electric light company at Llandrindod Wells want to put up a chimney stack at their works, but the Llandrindod Urban Council are not quite agreeable, for fear an impression may get abroad that there is a manufactory at Llandrindod.

Local Bills in Parliament.—A petition on behalf of the Great Western and London and North-Western Railway Companies, praying to be heard by counsel against the Shrewsbury Electric Lighting Provisional Order, when the committee stage is reached, has been deposited in the Private Bill Office of the House of Commons.

London.—At yesterday's meeting of the City Corporation, Mr. Brooke Hitching was to move in favour of a reference to the Streets Committee (or to a special electric light committee of 12 members) "to consider and report as to the desirability of approaching the directors of the City of London Electric Lighting Company, Limited, with a view to acquiring the whole or part of their undertaking by friendly purchase, and empowering the committee to ascertain on what terms, if any, the directors would sell the undertaking." The law officers of the Corporation have reported that the Corporation has no power to enter into competition with the company, and hence the proposal to buy out the monopoly.

At a recent meeting of the St. George's, Hanover Square, Vestry, a resolution was passed that a special committee of 12 members be appointed to consider the best means of lighting the parish by electricity, and to approach the Electric Light Corporations. A speaker said that the ratepayers had lost a great opportunity of making a good profit for themselves in allowing private companies to get a footing in the parish. The committee appointed includes Lord Hobhouse, Col. the Hon. H. Legge, Mr R. C. Antrobus, L.C.C., and Messrs. Bradford & Macdonald.

Long Eaton.—A town's meeting has requested the Council to oppose the Bill of the General Power Distributing Company, and stated that the town ought to have a municipal plant.

Lowestoft.—At the last Council meeting the Electric Lighting Committee reported that a letter dated April 26th was received from H. S. Foster, Esq., M.P., stating that he had a long talk with Mr. Ritchie on the subject of the electric lighting provisional order, and that the Board of Trade say that the undertakers, in their opinion, have the power already (empowering the Corporation to supply electrical fittings and fixtures, &c.) under the 1882 Act. But if they have not, the Board of Trade advise Mr. Ritchie that the Board of Trade have not the power to give it them by a provisional order. They deny that a meter is a fitting, or in any way analogous, and he thought that the wisest thing is to accept the decision and act upon the advice of the Board of Trade and exercise the power. The Town Clerk reported that he had approved the draft order as altered by the Board of Trade, and had received the bill confirming the order.

Mansion Lighting.—Moor Hall, Kidderminster, has been fitted throughout for electric lighting. A gas engine and dynamo have been put down in an outbuilding. A battery of accumulators is placed in a cellar. There are over 230 lights fitted, some of the fine old gas and other fittings being utilised. The work was done by Messrs. Whittaker Bros.

Mexborough.—The District Council has appointed a committee to go into the electricity supply question.

Morecambe.—There is much disappointment at the delay which has arisen in carrying out the contract for the installation of electric light. At last week's meeting of the District Council it was resolved to approve the Electric Lighting Committee's recommendation "that Messrs. Thomas Parker, Limited, be allowed to deliver the steam dynamos and exciter, which Mr. Parkinson has tested, and which he has reported as not being in accordance with the contract, subject, however, to the question of compensation standing over." The Local Government Board has sanctioned the loan of £8,821 for electric light purposes, being the sum of £10,000 applied for, less a deduction of £1,144 10s., the sum awarded to the Council in respect of defective cables, and £34 10s. for articles not forthcoming in connection with the purchase of the portion of the plant of the Morecambe Electric Light and Power Company, Limited, for which the Local Government Board sanctioned a loan of £3,900 on September 20th, 1897. Mr. Parkinson, the electrical engineer, has been authorised to engage the necessary additional staff, including assistant electrical engineer, engineer and switchboard hand, engine driver, battery man for three sub-stations, two trimmers, fireman, and labourer. At the Council meeting Councillor John Brown said they had got the first set of engines at the works, and the resident engineer expected being ready last Monday to switch on to the arc lights on the Front.

New Brompton.—In the High Street of New Brompton standards have been erected for the purpose of supplying the streets with electric light; but up to the present the electric light has not permanently appeared. It is stated that the present lamps are not quite suitable for street lighting, but that others will shortly take their place, and then the full light will appear.

Newcastle.—Last week Mr. Colamb and Dr. Hopkinson paid a visit to Newcastle to inspect the district, and to take notes for the purpose of their reports on cable and electric traction. Dr. Hopkinson is stated to have thought that the Corporation ground in City Road would suffice for one power station to supply current for the whole of the lines, and plant for 5,000 H.P. could be installed there.

Newport (I.W.)—An application from Edmundson's Electricity Corporation, asking the Council to sanction application for a provisional order on condition that they supply current for lighting the streets and public buildings at 4d. per unit, has been referred to the Finance Committee.

Newington.—According to our contemporary, the *Contract Journal*, the following tenders were submitted for the supply and erection of engines, dynamos, and public lighting plant at the new electric lighting station in Penrose Street for the Vestry of St. Mary, Newington:—

Sharp & Piper	£9,575
Siemens Bros. & Co., Limited	9,375
Brush Electric Company	9,090
Johnson & Phillips	8,975
Crompton & Co.	8,803
Fowler & Co., one section only	5,200

The tender of Messrs. Johnson & Phillips is recommended for acceptance.

Northwich.—Applications for current are coming in so well that the supply company is about to make further extensions. One main, three-quarters of a mile long, is to be laid to supply "The Brockhurst," Sir Joseph Virdin's residence. The Guardians decided on Saturday last to light the workhouse, and Messrs. Ames, Garrard and Co. have been asked to prepare a specification for the work. Feeder mains are to be laid from the electricity works to the Bull Ring, a distance of a mile. The supply company has now running two 100-B.H.P. Crossley engines, two 60-kilowatt dynamos, and one 19-kilowatt balancer, by Messrs. Laurence Scott & Co., Limited, with a 200 ampere-hour battery by the Chloride Syndicate, Limited. Lamps equivalent to 2,500 of 8-C.P. have been applied for, and about 2,050 connected to the mains.

Petersfield.—The District Council decided, at its meeting on 16th inst., by six votes to two (both of the latter being votes of directors of the local gas company, who urged the Council to await the result of the new incandescent gas burner), to instruct Mr. A. H. Preece, of Westminster, to furnish a report as to the practicability and cost of an electric lighting scheme.

Plumstead.—The Vestry has informed the Woolwich District Electric Light Company that it has decided to oppose any application for a provisional order to extend their supply to Plumstead.

Poplar.—The Board of Guardians do not agree to hold back their electric lighting scheme until the Poplar District Board of Works' undertaking is put down. We referred to this matter last week.

Portsmouth.—The principal business at last week's Council meeting was the presentation by Alderman G. Ellis, chairman of the Electric Lighting Committee, of the balance-sheet and revenue accounts for the year ending March 31st last. The receipts were as follows:—Private consumers, £10,833 16s. 3d.; public lighting, £4,645 19s. 2d.; sales by contract, £144 3s. 1d.; meter rents, &c., £641 4s. 6d.; total receipts, £16,265 3s. On the other side, the expenditure has been:—Generation of electricity, £5,909 10s. 5d.; distribution ditto, £1,006 15s. 7d.; repairs and renewals, £1,454 2s. 6d.; rents, rates, and taxes, £397 2s.; management expenses, £1,177 18s. 11d.; law charges, £11 15s. 4d.; interest on overdraft, £112 9s.; total expenditure, £9,469 13s. 9d. This leaves a gross profit of £6,795 9s. 3d. on the year's working. Of this sum £6,750 is carried to net revenue, leaving a balance of £45 9s. 3d. to be carried forward to next year's working. Out of the £6,750, the Committee have paid £3,180 19s. 4d. for interest on borrowed capital, and £2,793 13s. 7d. towards redemption of loans, leaving the sum of £776 to the good. With regard to the capital account, the total amount sanctioned to be borrowed is £142,000. Of this sum £119,651 has already been borrowed, leaving a sum of £22,349 yet to be called up. Out of this gross sum of £119,651 already borrowed, there has been expended £112,174 7s. 10d., which has been disbursed as follows:—Land and building, £14,009 15s. 6d.; machinery, mains, meters, transformers, &c., £95,620 18s. 5d.; engineers' commission, £2,196 5s.; furniture expenses, &c., £347 8s. 11d.; total, £112,174 7s. 10d. Alderman Ellis, in moving the report, said that he was disappointed with the revenue made. In the first part of the year they would remember that permission was given to reduce the price of the current ½d. per unit, and the Committee felt that they would have a large influx of customers, which would more than compensate. The customers did come, by dozens and by hundreds, but unfortunately for them and for the nation, the strike and lock-out upset all their plans, and prevented them taking any customers on up till January 1st of this year. To show them that they would have progressed, he would mention that from January 1st up to that morning the increase of lights amounted to 5,872. Every one of these might have been joined up last year had they had the plant. But there was another point. When they reduced their price, they practically brought their revenue down to 3⅔d. per unit sold, because they sold the units for street lighting at a much smaller price than that paid by the ordinary consumer. Portsmouth was almost the lowest in the whole of the United Kingdom, and he thought it must be very satisfactory to the inhabitants to know that while they were making a profit of £6,795 gross, they charged as low as or lower than any other town in the United Kingdom. What had they done with the profit? There were the extraordinary charges due to the lock-out, £654 for replacing the arc mains in the town, which were not strong enough, £112 interest on bank charges, £3,180 interest on the loan, and £2,793 for the sinking fund. There was a net profit of £820 16s. 4d. During the past few weeks they had had a good deal of criticism upon the balance-sheet, and they had been told by certain people that they ought to have a large fund for maintenance. He would agree with that view if they were dealing with the gas company, water company, or an electric light company. But they were not dealing with anything of the sort. He would go further, and say that if they were dealing with the great city of Glasgow or the large city of Leeds, he would agree. But the case of Portsmouth was different. Why did he make this difference?—Because Glasgow borrowed money in ordinary stock for 42 years. Leeds took over a company and paid £2 for every pound paid, and the Local Government Board had permitted them to borrow the money for 42 years. That was not the case in Portsmouth. They had borrowed the money for engines for 15 years only. And if anyone said that the engines would be worn out in 15 years, and would have to be replaced by new ones, he did not know anything about it. It was not necessary to provide a sinking fund of any dimensions for renewals. To ask them to pay in 15 years the sinking fund and interest, and to hand to the Council on that date a sum equivalent to the sum equal to rebuild the whole thing again, would be monstrously hard on this generation, and would be totally unnecessary. It was the consensus of opinion throughout the country that there was no necessity for a renewal fund sufficient to replace the machinery. They were quite at liberty at the end of the 15 years to re-borrow the money, and allow the generation of that date to pay their own charges for their own benefits. He moved the adoption of the balance-sheet. After discussion the report was adopted.

Rhyl.—Mr. H. W. Buddicomb, Penbedw Hall, Nannerch (N.W.) has written to the District Council stating that he noticed that at most seaside and holiday resorts the authorities were adopting the electric light for public lighting purposes, and he asked, in the event of the Council not having powers of their own for supplying electric light, whether they would approve of an application by him for such powers, and agree to take electric light for illuminating the sea front. He also asked their consent to an application for laying down a system of electric tramways. The letter was referred to the Road Committee for consideration and report.

Russia.—A company has just been formed in St. Petersburg, with a capital of six million roubles, to be known as the Russian Union Electrical Company. The new concern will acquire and take over the central electric lighting station in the town of Riga, and also propose to establish similar stations in other Russian towns.

Saltburn.—Last week the Urban Council had before it the report of Mr. Burstall (Burstall & Monkhouse), *re* electric lighting. It is pointed out in the report that Saltburn is smaller in area and population than any town in which a public electric lighting installation is already at work, and it was therefore difficult to estimate the number of lamps required. For a specified area in the first year there might be a demand for 1,800 8-C.P. lamps, and in the second year 2,500 to 3,000. He advises, as suitable for a site, land lying to the west of the Whitby branch railway. Low tension continuous current system, with 250 volts at consumers' terminals, is recommended. The dynamos would be driven by 50-H.P. steam engine. The utilisation of water-power at Marske mill is out of the question. Capital expenditure is estimated as follows:—Generating plant at station, £3,200; buildings, £1,500; mains and fixings, £2,500; public lighting, £500; meters and other apparatus, £250; legal and professional charges, £1,000; total £7,000, plus cost of land; 7d. per unit would be charged for current and public lighting at 3½d. per unit. The total income is put at £834 per annum, working expenses, £573; gross profit, £261. Interest and sinking fund would cost £460 for the first year, leaving a deficit of £199. The matter is to be laid before the ratepayers, who are to vote upon it. A provisional order will be applied for in November.

Shoreditch.—The Lighting Committee reported at the Vestry meeting on Tuesday evening that Mr. H. E. Kershaw had been re-appointed chairman of the committee. The committee had had under consideration the correspondence between the chief electrical engineer and the contractors, on the subject of the automatic gear to the Willans engines, which had not proved to be satisfactory, and which the contractors had agreed to take back. At the suggestion of the committee the Vestry approved the return of the gear as sanctioned by the consulting engineers. Mr. Kershaw, chairman of the committee, in moving the adoption of certain alterations in the charges for electric current, stated that the reductions amounted to 25 per cent. to the average customer. The chief electrical engineer (Mr. Russell) had submitted to the committee an estimate of the liabilities and income for the next 12 months. That estimate was based upon the reduced rates, and showed that they would have a substantial surplus of income over expenditure to the extent of over £4,000. Thus the committee, who were practically unanimous on the reductions, were justified in asking the Vestry to approve the projected new charges. Among other changes, the committee proposed to reduce the charge for current from 6d. to 5d. per unit for the first two hours, and to 2d. afterwards, whilst consumers would have the option of being charged a fixed rate of 4½d. per unit. It was also intended to abolish meter rentals, to reduce the charge for public lighting from 5d. to 3½d. per unit, and the charge for current for motive power purposes to 2d. per unit for all hours, all alterations commencing on the 26th inst. Mr. Winkler moved that the proposals should stand over for two months; but after some discussion, the Vestry adopted the various recommendations made to effect the alterations in the scale of charges. On the motion of Mr. Kershaw, the Vestry Clerk was instructed to supply the members with copies of the report of the Parliamentary Committee on the supply of electrical energy, in order that the Vestry might consider what action should be taken in the matter of opposing the clauses in that report.

Shrewsbury.—The Council has authorised the Town Clerk to make application to the Local Government Board for sanction to the raising of a loan of £35,000 to complete the purchase of the undertaking of the Shropshire Electric Light and Power Company, Limited.

The Board of Trade have issued copies of the new provisional order, which they have just forwarded to the Corporation of Shrewsbury, authorising them to supply electricity throughout the area of their borough.

South Africa.—The electrical engineer of the Bulawayo Electric Light Company (Mr. J. H. Meikle), has lately been on a tour in the southern colonies, and had inspected the electric lighting plants in the various towns. Those at Johannesburg and Durban struck him as being the most up-to-date installations. They were both high tension alternating, the same as at Bulawayo. The only plant with accumulators was that at Cape Town, which was at least five years old, and had given trouble from the day it started. He considered that at Bulawayo they had a thoroughly efficient and up-to-date installation. It is interesting to note that the maximum charge for house lighting is 2s. 6d. per unit for small consumers, reducible to 2s. for large consumers, churches, Government buildings, &c., pay 1s. 7d. per unit.

Stockport.—Mr. A. J. H. Carter, late clerk of works, and chief assistant engineer for the Brighton Corporation, has been appointed clerk of works for the electric light installation in course of erection at Stockport. There were 54 applicants for the appointment.

St. Pancras.—The Electric Lighting Committee reported at the Vestry meeting on Wednesday, that they had instructed the chief electrical engineer to make experiments with a view to the utilisation of the surplus steam from the refuse destructor for the purpose of driving the electric light engines. Mr. Sydney W. Baynes, the engineer, had carried out a number of tests, but owing to the irregularity in the supply of the steam, it was not possible to depend upon it for the particular purpose in question. It had therefore been decided to abandon the idea of utilising the steam for electric lighting purposes. The report was passed without comment. It was resolved that the Vestry should be represented on the Municipal Electrical Association.

Swinton and Pendlebury.—The District Council will not allow the Salford Corporation to supply electric current to Swinton Cottage, Swinton Park, but the Council will be itself going into the matter of electric lighting shortly.

Taunton.—The Electric Light Committee has reported that the total connections made during May were equivalent to 623 8-C.P. lamps.

Teddington.—The District Council has agreed to confer with the Twickenham Council before coming to any decision regarding the proposal of Edmundson's Electricity Corporation to form a company for lighting the two districts.

Towyn and Aberdover.—A Colwyn Bay resident recently offered to prepare a scheme and estimates for electric lighting, and the District Council referred the matter to a committee.

Walsall.—The Midland Electric Corporation for Power Distribution has notified its intention to omit Walsall from its proposed area of supply.

A tender has been accepted for laying the foundations for the new engine and dynamo at the generating station.

Winchester.—The works of the Winchester Electric Light and Power Company are now completed. They will be formally opened on the 30th inst., and invitations have been issued.

ELECTRIC TRACTION AND MOTIVE POWER NOTES.

Barking.—The engineer has submitted to the District Council plans, estimates, and report, upon his scheme of light railways from Barking to Beckton, and has attended before the Lighting Committee to explain details. The committee had resolved that such scheme be approved, and that the clerk supply a copy of such estimate and report, as well as of the draft order and book of reference, to each member of the Council. It was resolved that Mr. W. C. C. Hawtayne be appointed electrical engineer, to act in conjunction with Mr. Barker, in connection with the light railways scheme, upon terms to be subsequently arranged. The Light Railway Commissioners have notified that they will hold an inquiry on the 23rd inst.

Blackpool and Fleetwood.—The Board of Trade inspection of the new electric tramroad connecting Fleetwood and Blackpool was expected to take place this week. Open cars will be used during the summer months, and already several trial runs with these have been made, the distance between Uncle Tom's Cabin, Blackpool, and the centre of Fleetwood being covered in 23 minutes.

Bristol.—Last week in the Commons the Bristol Tramways (Electrical Power, &c.), and the Bristol Tramways (Extensions) Bills were read a third time.

Cardiff.—The Electric Tramways Committee held a special meeting last week to consider what steps should be taken with regard to the proposed electric trams now that Parliament had granted the powers asked for by the Corporation. After discussion it was decided that nothing further could be done in the matter of the proposed trams until the question of overhead wires *v.* conduit system had been settled. A deputation will shortly report on the question.

The City and South London Railway.—According to the *Times*, in consequence of representations from Mr. Austin, the President of the Board of Trade has promised to make inquiries concerning the alleged overcrowding on the City and South London Electric Railway. At the same time steps will be taken to ascertain whether there is any foundation for the complaint that insufficient means of ingress and exit are provided for passengers at the King William Street and Stockwell stations on the said line.

Enfield.—Mr. B. Godfray, solicitor, and Mr. J. W. Ransome, engineer, appeared before a committee of the District Council last week, representing the company which is promoting the light electric railway scheme (overhead trolley) for this and the surrounding district. It is stated that the Light Railway Commissioners will hold an inquiry on July 13th. It has been decided at present to proceed with only the lines running from Wood Green to Enfield, from Wood Green to Tottenham, and from Enfield to a junction with the lines of the North Metropolitan Tramways Company in Hertford Road.

Gillingham.—At the fortnightly meeting of the Gillingham Urban District Council (16th inst.) the question of electric trams was again discussed, and the clerk (Mr. F. C. Bowlen) reported the favourable result of the adjourned inquiry held by the Light Railways Commissioners as to a scheme for light railways in the district.

Glasgow.—The general manager of the Tramways Department (Mr. John Young), last week submitted to the Tramways Committee a statement of the revenue and expenditure account for the year ending May 31st, subject to final audit. Though these figures have no direct connection with electric traction, they will be interesting in view of the great attention which electrical men have been and will be giving to the Corporation trams here. The statement showed that the gross revenue amounted to £394,111 12s., and the working expenses to £293,594 11s. 9d., leaving a balance of £100,517 0s. 3d as compared with £84,596 3s. 1d. for the preceding year. The fixed charges, such as rent of Govan lines, interest on capital, statutory sinking fund, and payment of £9,000 to the Common Good, amounted to £38,465 0s. 9d., leaving a balance of £62,051 19s. 6d., to be deducted for depreciation and to be added to the renewal and general reserve funds. The total number of passengers carried during the year was 106,864,437, as compared with 98,966,638 for the preceding year, 86,462,594 for the year ending May 31st, 1896, and 57,104,647 for the first 11 months ending May 31st, 1895. The balance of revenue, after deducting working expenses, was £84,596 3s. 1d. for year ending May 31st, 1897, £83,267 7s. 11d. for year ending May 31st, 1896, and £35,699 3s. 3d. for 11 months ending May 31st, 1895.

The Great Northern and City Railway.—We understand that the company has succeeded in effecting arrangements with all the opponents to the Bill of the present session. This Bill will now pass as an unopposed measure through its remaining stages in the House of Commons.

Greenock.—The Greenock and Port-Glasgow Tramways Company are contemplating the introduction of electric traction on the tramway system. The present lease is almost expired, and it is stated that, should it be renewed, application will be made for Parliamentary powers.

Harrogate.—The Town Council last week had a discussion with reference to the proposed light tramways from Harrogate to Knaresborough, and it was resolved that the decision of the committee averse to the scheme be endorsed, Harrogate not being adapted for tramways.

Hendon.—The committee appointed by the District Council to consider the project of the London, Edgware, Hendon and Barnet Light Railway has reported that the promoters proposed to construct a line along the Edgware Road to the Old Church, Edgware. The gauge would be 4 feet 8½ inches wide—double in parts—and presumably with poles in the centre of the road for carrying overhead wires. It was proposed to acquire three acres of land adjoining Edgware Churchyard for works. The promoters understood to carry passengers, cattle, stone, minerals, fish, &c., the rates to be subject to revision triennially. The committee came to the conclusion that although better means of communication were required, they did not consider the proposed scheme was the best for the purpose. The District Council has adopted the report.

Johnstone.—The British Electric Traction Company have laid several communications before the Town Council relative to connecting Johnstone with the proposed tramway to Glasgow. Provost Thomson said he would give the proposed tramways the most uncompromising opposition. The Council has agreed to meet with the representatives of the company with a view of receiving information *re* the proposals.

Light Railways and Tramways.—In the House of Commons last week, in reply to Mr. Hazell, Mr. Ritchie said: There is nothing in the Light Railway Act to prevent the consideration of light railway schemes in urban districts. The Light Railway Commissioners and the Board of Trade have ample powers to impose on promoters as a condition precedent to entertaining an application powers of purchase as large as those defined in the Tramways Act of 1870. The Light Railway Commissioners have the scheme promoted by the Metropolitan Tramways and Omnibus Company, Limited, under consideration, but, as they have an independent jurisdiction, I am not in a position to say what steps they will take with regard to it.

Limerick.—A committee of the whole house of the Corporation last week had the following items under consideration:—Electric trams, &c.—Letters from (1) H. Bickerdike, Montreal, proposing to introduce the "American electric trolley system" into the city, on terms to be arranged; (2) Mr. J. E. Palmer, Ballybrack, Co. Dublin, applying for a lease for 150 years of the sole right to construct, equip, maintain, and work electric tramways in the city, and proposing certain routes for which the lease is asked; and (3) M. Zeitz, Hamburg, offering to supply cars, completely fitted out, for the overhead system of electric traffic. In connection with above to consider advertisement of the Limerick Electric Tramways Company, Limited.

Liverpool.—The laying of the rails for the experimental electric line from Castle Street to the Dingle is on the eve of completion, and the cars will soon be given a trial.

London United Tramways Bill.—On Friday last this Bill was again before the Select Committee of the House of Commons. Evidence against the Bill was given on behalf of the Middlesex County Council, and by Mr. J. W. Benn on behalf of the London County Council. Mr. Benn said that the L.C.C. most heartily joined with the Hammersmith Vestry in opposing the attempt to take away from a local authority the right of veto conferred upon it by Parliament. Under the Tramways Act of 1870 it was provided that local authorities should have power to purchase the lines at the expiration of 21 years. In the case of the London County Council that period had been modified in several instances, so that the lines should become purchaseable about the same time. In 1890, 4½ miles came under the purchase clause. Since then the London County Council had become the owners of about 68 miles out of the 114 miles which would become purchaseable under the Act. The London County Council were very anxious that any form of traction adopted should, as far as possible, accord with the system which it was hoped presently to determine upon as the best. It was very desirable that the veto should be maintained especially in the case of the London County Council, which would presently be ground landlord so to speak, of the complete tramway system of London. In three cases the Council had given its consent to the use of electricity on London lines. In his opinion, it would be a very serious thing to allow a tramway company to erect a generating station and supply electricity in bulk except under the same regulation which applied to electric lighting companies.

On Monday, when the consideration of the Bill was resumed, Mr. J. W. Benn, chairman of the Highways Committee of the London County Council, said the scheme of the company was excellent, but the promoters ought to sacrifice a little in order to meet the wishes of the county of London.—Mr. Pope, in addressing the committee on behalf of the London County Council, said the object of the County Council was not to impede the growth of electrical tramways, but to preserve its authority over such undertakings within the county of London.—Mr. Littler, replying on behalf of the promoters, said they were quite prepared to leave the question as to whether the overhead or the conduit system should be applied to King Street west to the decision of the Board of Trade, and, inconvenient as it would be to have a part overhead and part culvert system, they were quite willing to work the small portion of the proposed line within the county of London by the latter method. In America, electric tramways on the overhead system had increased from 1,200 miles to 14,000 miles, whilst the mileage on the culvert system had decreased. Counsel read reports on the trolley system from Belfast, Glasgow, Sheffield, Birkenhead, Liverpool, Manchester, and Dublin to show that the consensus of opinion was greatly in favour of the overhead system as opposed to the culvert system.—The committee decided, according to the *Times* report, that the preamble of the Bill with regard to tramways No. 6 and 7 (the Boston Road and the Kew Bridge to Hounslow sections) was proved, but did not impose upon the promoters any condition as to simultaneous construction. The committee were of opinion that the preamble was not proved with regard to tramway No. 8 (the Ealing section), and were further of opinion that a sufficient case had not been made out for overriding the principle laid down by Parliament requiring the consent of the local authority, and therefore Clause 27 (repealing the veto) must come out of the Bill. The committee were strongly of opinion that the congested state of London made the speedy adoption of electric traction on tramways necessary, and they earnestly trusted that arrangements might be made between the London County Council and the promoters by which the benefits of one system or another of electrical traction might be secured to the public at the earliest possible date. With the view of enabling the promoters and the London County Council to discuss the matter so far as it related to the lines within the county of London the consideration of clauses was deferred.

The Bill was before the Committee again on Tuesday, Mr. Earle, for the Middlesex County Council, urged, says the *Times*, that that body should be put on the same footing in the matter of veto as the London County Council, so that they could insist upon the same system of traction being used in Acton as was employed in the county of London. Mr. Coward replied that the promoters had met the London County Council, but had not been able to arrive at an agreement, and a further consultation had been arranged. The promoters had suggested to the County Council that the tramways which had been acceded to by the committee should be worked by accumulators, but the Council had not yet had sufficient time to consider the proposal. The promoters did not know whether the County Council would accept the suggestion or not. The chairman explained that the committee in giving their decision had not intended that the agreement to be arrived at between the County Council and the promoters should be embodied in a clause to be submitted to the committee. Their desire was merely that the parties should agree. Mr. Earle maintained that the Middlesex County Council had a right to be so heard, as they were the persons who, under the Act of 1888, had to pay the expense of maintaining the roads. The committee decided not to sanction a dual authority, and therefore rejected Mr. Earle's application. The committee then proceeded with the consideration of clauses.

Our contemporary says that the committee on Wednesday presented a special report to the House of Commons stating that, in their opinion, a sufficient case had not been made out for overriding the principle laid down by Parliament in the London United Tramways Order, 1895, which requires the consent of the London County Council to the use of mechanical power upon tramways in the County of London, and that they had, accordingly, rejected Clause 27 (repeating existing provisions as to motive power), so far as it affects the County of London; but they are strongly of opinion that the congested state of London makes the speedy adoption of electric traction on tramways necessary, and they earnestly trust that arrangements may be made by the London County Council with the London United Tramways Company whereby the benefits of one system or another of electric traction may be secured to the public at the earliest possible date.

Manchester.—The Manchester Carriage and Tramways Company's Bill is to be opposed before the House of Lord's committee by the Manchester Corporation, the Stalybridge Corporation, the Eccles Corporation, Salford Corporation, Levenshulme Urban District Council, Moss Side Urban District Council, Stretford Urban District Council, Withington Urban District Council, Heaton Norris Urban District Council, Stockport Corporation, Aston-under-Lyne Corporation, Denton Urban District Council, Gorton Urban District Council, Failsworth Urban District Council, Oldham Corporation, and the Swinton and Pendlebury Urban District Council. The London and North-Western Railway Company and the Lancashire and Yorkshire Railway Company have also petitioned against the measure.

At a meeting of the special committee of the Corporation *re* tramways, held on 20th inst., a recommendation to be made to a special meeting of the City Council convened for Wednesday last, was approved. For some time past a sub-committee has been in negotiation with the various outside local authorities in regard to the taking over of the tram lines in their areas by the Corporation, and the result was the drawing up of an agreement. By this agreement the Corporation will next session apply to Parliament for authority to lease the tramways from the local authorities, and to work the lines "either with animal or mechanical power, including power, with the consent (hereby granted) of the local authority, to equip the tramway for electric traction on the overhead system, in the same manner as tramways within the city of Manchester shall hereafter be equipped by the Corporation on that system." This application is to be supported by the local authorities, who will give the Corporation a 21 years' lease at an annual rental, the Corporation to pay all local rates in respect of the tramways. If the terms of the lease are not settled by mutual agreement, the Board of Trade, or a referee appointed by that Board, will decide. These arrangements do not apply to Withington and Moss Side, where the local authorities own their own tramways. An endeavour is being made, however, to conclude arrangements by which these lines also shall be leased to the Corporation. The committee has confirmed the report of the sub-committee, and approved of the terms of agreement.

At Wednesday's special Council meeting it was decided to confirm the committee's proceedings, the lines to be reconstructed so as to be worked by electricity. An amendment after the words "electric traction," to substitute the words "on any system which may hereafter be decided by the Corporation," was lost.

The Metropolitan Railway and Electric Traction.—The Metropolitan Railway Bill came before the Lord's Committee on Wednesday. The Bill under which powers are sought for the purchase of additional land for ventilation purposes was opposed by various vestries. Mr. Littler in opening the promoters' case, said there was a prospect of electric traction being adopted on the railway in the near future, and the promoters were now acting upon the report of the Board of Trade, which recommended as a temporary measure that a few more openings should be constructed as a satisfactory means of ventilation which might afterwards be useful in the event of the adoption of electric traction. The time had not arrived when it would be wise to substitute electric traction for the present means of locomotion, but arrangements were in process with the District Railway for experiments to that end. Colonel Bell, the chairman of the Metropolitan Company, said that arrangements had been concluded with the Metropolitan District Company for the experiments with electricity. Sir Benjamin Baker stated that the electrical experiments referred to would occupy at least 12 months.

Paisley.—Mr. Teague, the Council's electrical engineer, recently submitted a report prepared by him on the proposed construction of electric tramways by the British Electric Traction Company, Limited. A sub-committee was appointed to consider and report upon it. At a meeting of the sub-committee the report was laid on the table, and it was unanimously agreed to recommend that, in the event of the electric tramways being constructed, the overhead system of traction be adopted, and that in the carrying out of the work it should be done by the Corporation under the direction of the undertakers. Bailie Nicolson moved, at the Council meeting last week, that the minute be remitted for further consideration. The motion was agreed to.

At a meeting of the sub-committee of the Renfrew County Council last week, a conference was held with several members of the Paisley Town Council and the Tramways Committee anent the proposed electric tramways between Paisley and Johnstone. The convener having stated the object of the conference, Councillor Gondie explained the position of the Paisley Town Council regarding the proposals of the British Electric Traction Company to construct electric tramways in that burgh, and also on Beith Road between Paisley and Johnstone; and Mr. Mann having similarly explained the position of the District Committee, a general discussion ensued and interchange of views. Mr. Sellon, of the British Electric Traction Company, afforded information as to the project of the company, and in reply to queries by members of committee stated that in the meantime they proposed to lay only a single line of rails, with passing places; and in reply to a further question by the convener, he stated definitely that the company would not undertake to lay a double line of rails, even on the road between Glasgow and Paisley, until the company were satisfied that their traffic could not be accommodated by a single line. The committee, after consideration, agreed that the granting of the order to the Traction Company should be strenuously opposed.

Sheffield.—It will be remembered that the City Council recently instructed Mr. F. Nell, of London, to report upon the advisability of utilising the compensation water of the city reservoirs to produce electricity for traction purposes. Mr. Nell's report was last week before the Tramways Committee. In it he discusses the amount of power available at the Damflask, Rivelin, and Redmires reservoirs, and in the case of the first two gives the approximate cost of utilisation, and in regard to the latter no power could be obtained. The committee, after considering the report, passed the following resolution:—"That this committee, having considered the report of Mr. Nell, the expert, which confirms in all respects the reports presented to this committee by the water engineer and the electrical engineer, is of opinion that as at present advised it is economically impracticable to utilise the compensation water at the disposal of the Water Committee for generating electricity for electric tramway traction."

Stoke-on-Trent.—The Board of Trade has written to the Town Council respecting the dispute existing between local authorities interested and the British Electric Traction Company as to the setts to be used for paving the tramways. The company applied under Section 33 of the Tramways Act, 1870, for the appointment of a referee to settle the matter in difference. The Council has replied asking to be represented before such referee.

Surrey Light Railway.—The London United Tramways Company have withdrawn their application for a light railway from Kew to Kingston and Hampton Court over Richmond Bridge. The intimation was given the Town Clerk of Richmond by letter on Wednesday last week. The action of the company is due to the amount of opposition they have met with the Richmond Corporation, Richmond Vestry, private owners, and large landowners, including the Duke of Cambridge and Lord Charles Beresford, the Ham District Council, the Kingston Corporation, Kingston Bridge Commissioners, Hampton Wick District Council, and the County Councils of Middlesex and Surrey, the whole of the public authorities covering the proposed route were opposed to the order being granted. The withdrawal of the scheme follows but a few days the abandonment of the Bill in Parliament by the same company to carry a tramway with overhead electric traction over Kew Bridge, connecting Richmond with Brentford and joining the starting point of the light railway.

Sunderland.—Last week the Corporation tramways deputation journeyed to the Continent to inspect tramways in various cities.

Swansea.—The sub-committee on tramways has considered whether any concession should be made to the British Traction Company in consideration of their widening certain streets, and proposes that the Corporation should make the same offer as in the Act of 1887, and provide the £22,000 required for the purpose on loan at 3 per cent. interest for 30 years. The Council, after discussion, resolved to favourably consider the offer if the security was deemed by a sub-committee sufficient.

Waterford.—The preliminary work in connection with the new electric tramway in the city of Waterford has not yet commenced. The promoter who has got running powers from the Corporation is Mr. Palmer, Dublin.

West Derby.—Messrs. F. J. Leslie & Co. submitted plans, &c., to the Parish Council of a light railway which their clients, the Lancashire Light Railway Company, Limited, were applying for powers to construct between Liverpool and Prescot, the intention being to unite by a light railway or tramway worked by electricity the St. Helens tramway, which terminates at Prescot, with the Liverpool tramways. The Council was asked to support the suggestion as to the proposed tramway to connect St. Helens with Liverpool over that part of the high road commencing at the city boundary and going in the direction of Prescot. The Council sees no objection to the proposal, but has asked for fuller information.

Yarmouth.—The Electric Lighting Committee has had a conference with a deputation from the Yarmouth and Gorleston Tramway Company with regard to the working of the tramways by electricity. The conference was adjourned.

TELEGRAPH AND TELEPHONE NOTES.

The National Telephone Company and the St. James's Vestry.—With reference to the communication recently addressed by the National Telephone Company to a large number of their subscribers in the West End, whose telephone lines have been disconnected as a result of the recent fire in Heddon Street, in which an attempt was made to throw the responsibility for this interruption in the telephone service upon the St. James's Vestry, Mr. T. H. Munsey, the vestry clerk, writes to the *Standard*, stating that the facts are these:—"In March, 1897, the company made application to the Vestry for permission to lay pipes in Regent Street in accordance with plan submitted, to which the Vestry resolved to give their sanction, on condition that the company entered into the usual agreement, embodying payment of a nominal rent and power to require the removal of the pipes on six months' notice. The draft agreement was submitted for the company's approval, but they refused to accept it (although they had entered into a similar one with respect to Piccadilly in the previous year), and altered the draft so as to extend it to a general permission to lay pipes in the future. Considerable correspondence ensued, and when at length the draft agreement was returned it was discovered that the plan which was originally submitted and attached to the draft had been retained by the company. After repeated applications, an entirely new plan was sent in to be attached to the agreement, when it was found that this plan differed very materially from that sanctioned by the Vestry, and on getting back the original plan this also, on examination, was proved to have been considerably varied since passed by the Vestry. Under these circumstances, the Vestry declined to proceed further in the matter until the company had given a satisfactory explanation of the alterations which had been made in the plans. The explanation given was not deemed to be satisfactory, and the Vestry accordingly, in July last, having regard to this fact and to the delay of the company in entering into the agreement, and to the great inconvenience and delay which would then have been caused in the repaving of Regent Street, about to be commenced, by the laying of the company's pipes, withdrew their consent to the laying of the pipes in the thoroughfare in question. Amended applications, dealing with various parts of the parish, were afterwards submitted for the Vestry's consent, but, after the experience gained, the Vestry declined to consent to the same, the company not making any proposals for the benefit of the ratepayers, and, in fact, declining to pay any material rent for the privilege sought."

If the above statements represent the actual facts of the case, it would seem that the National Company is not going the right way to work to make friends.

The New Gotland Cable.—The c.s. *H. C. Oersted* has returned to Henley's Telegraph Works, North Woolwich, after laying the new Gotland cable for the Swedish Government. This cable extends from Ahr, in North Gotland, to the Island of Sandö, thence to Hufvudskar, thence to the Island of Ornö, and thence finally to Dalarö. From the cable station on the southern side of Ornö, an aerial line, some miles in length, is about to be built to the northern side of the island to connect with Dalarö, and thence by the existing system of aerial lines to Stockholm. One main object of the new cables just laid is to connect the various lighthouses on the islands in question with the Swedish mainland. It may be mentioned, as an interesting fact, that telephonic communication was successfully established between Ornö and Ahr (the cable ends at the intermediate stations being joined together), through some 80 knots of cable. The core is $\frac{107 \text{ lbs. Cu.}}{150 \text{ lbs. G.P.}}$ per knot. During the cable-laying operations, considerable care had necessarily to be used in navigating the ship through the numerous rocky islets and shallows which stud the Baltic coast at this part; and some difficulty, moreover, was experienced from fog, but the submersion of the cable was effected without a hitch. The expedition was in charge of Mr. Theophilus Smith, Messrs. W. T. Henley's submarine engineer, while Mr. J. F. Hall had control of the electrical testing and speaking arrangements.

Stockport Telephones.—The Corporation has declined to grant to the National Telephone Company, Limited, permission to lay pipes or conduits beneath certain main streets of the borough for the purpose of placing telephone wires underground. The ground of refusal is that the company does not possess statutory powers, as in the case of tramways and electric light undertakings.

Yarmouth Telephones.—Last week the Town Council passed a resolution in favour of municipal control of the telephone service which it was said might be trebled and the cost reduced.

CONTRACTS OPEN AND CLOSED.

OPEN.

Barnet.—June 24th. The Lighting Committee want tenders from firms willing to undertake such installation for lighting the district by electricity. Particulars at the Council offices, and see "Official Notices" June 10th.

Belgium.—August 1st. The municipal authorities of Stavelot are inviting tenders until August 1st for the concession for the supply of electrical engines for lighting and power purposes in the town during a period of 30 years. Tenders to be sent to L'Administration Communale de Stavelot (Belgium). Particulars from the Secretariat de la Ville on payment of 4 francs.

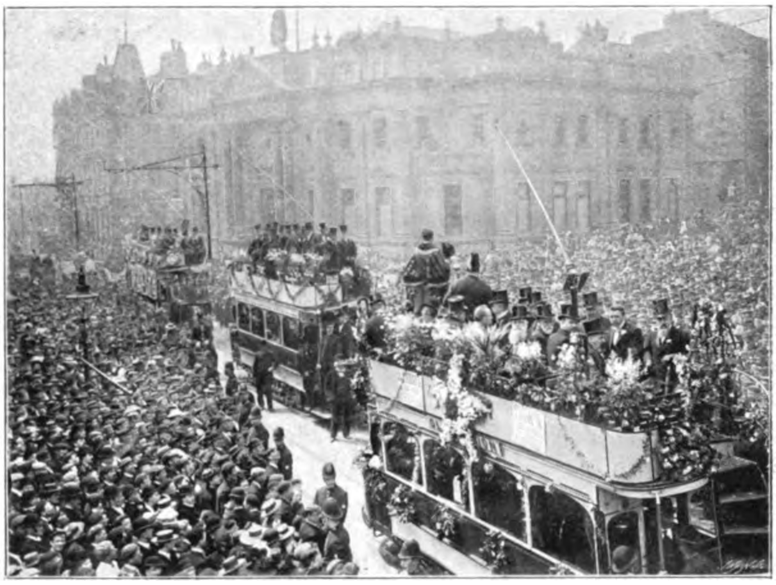
Bethnal Green.—June 28th. The Board of Guardians invite tenders for supplying the necessary plant and installing the electric light at the new infirmary, Palestine Place. For particulars see our "Official Notices" June 10th.

Bootle.—June 28th. The Corporation wants tenders for the erection of an electric light station in Pine Grove. Particulars from the borough engineer, Mr. J. A. Crowther.

(*Continued on page* 889.)

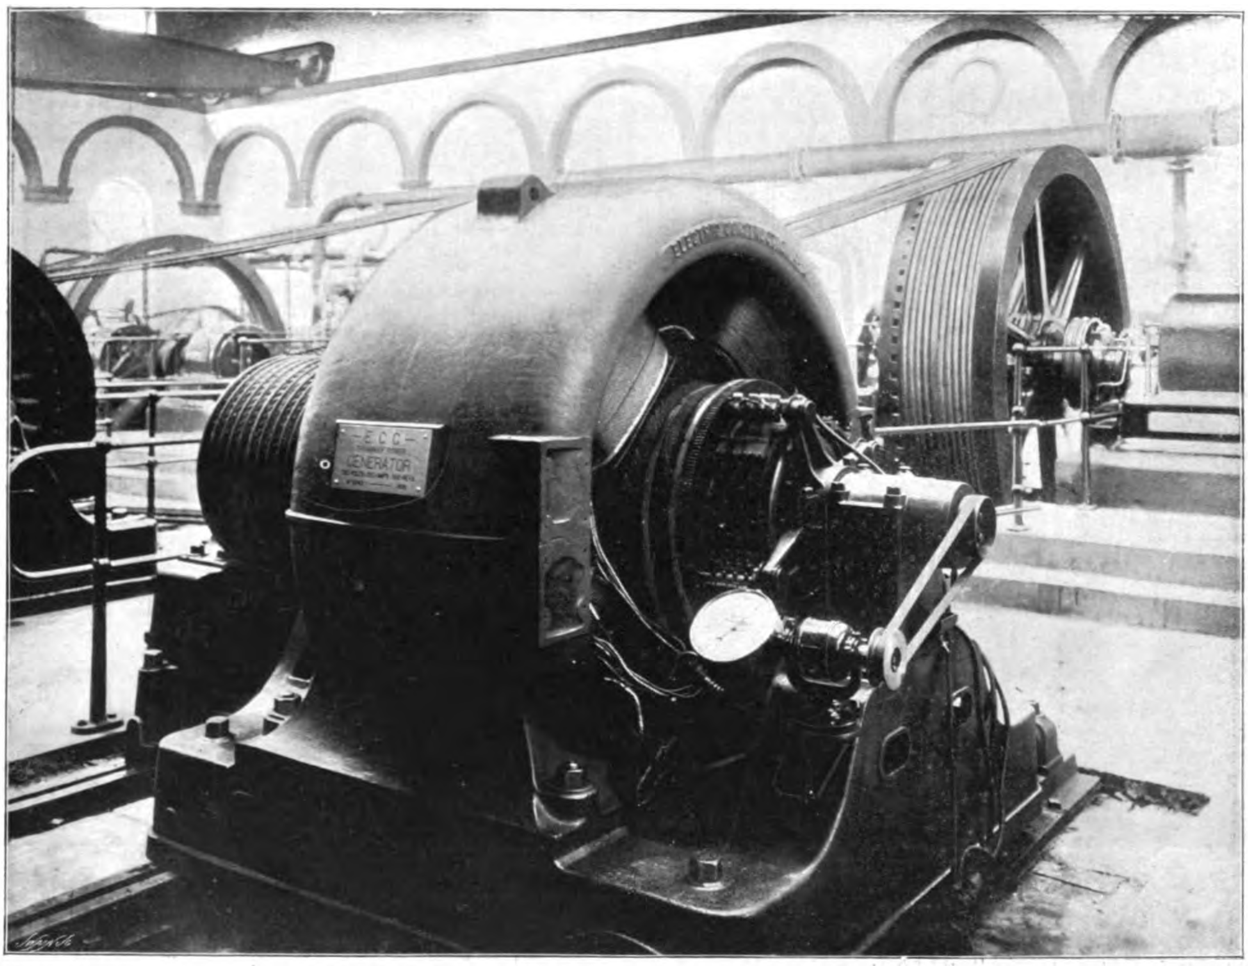
THE HALIFAX MUNICIPAL ELECTRIC TRAMWAYS.

The completion of the Halifax municipal electric tramways is of special importance at the moment, because it constitutes what we may fairly term the first combined lighting and tramway system in the country in which the plant is entirely controlled by a municipality. It is scarcely necessary to say that it is the forerunner of many others, for constructive work on similar lines is being carried out at Glasgow, Hull, Bradford, and Plymouth. The advantages of combined schemes are too well known to be recapitulated here, and though we cannot go so far as to say they are likely to show any startling economy, it is undeniable that some benefit will accrue to the arrangement.



An Imposing Ceremony.

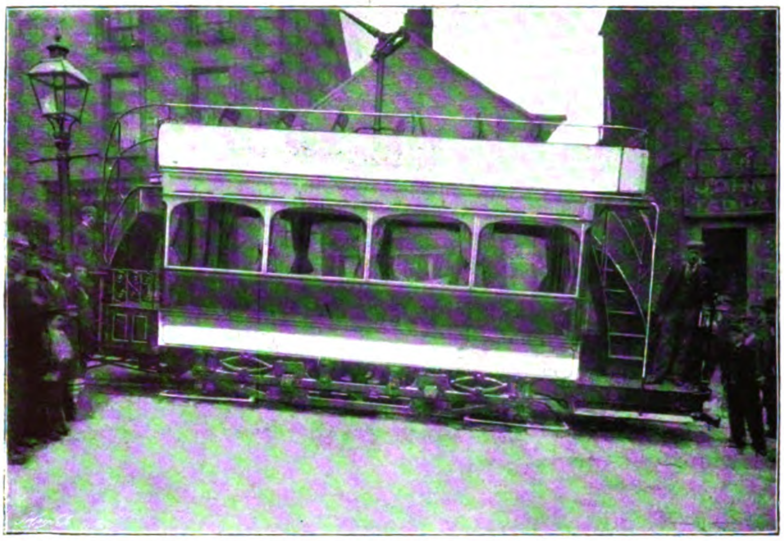
Prior to the introduction into Halifax of the present electric lines, no system of tramways existed in the town, and we are not surprised. "Up the street" and "down the street" are phrases that have some real significance in Halifax. The 'buses that traverse some portions of the town require teams of five horses; even then the tenure of life is so limited, that a horse is not expected to be in active service for more than three years, and it is a frequent occurrence for one to make a quiet protest by dropping dead in the street. Under such conditions a cable tramway would at once suggest itself, but it is doubtful whether such a system would have been flexible enough, especially when taking into consideration the development that was likely to occur. A suggestion was made, we believe, to have a combined scheme of cable and electric line, but piecemeal systems are always best avoided, moreover, in spite of the advantages offered by a cable on severe gradients, we are, after a close examination of the Halifax lines, doubtful whether even a cable system would have given a more satisfactory performance than we witnessed last week. We will, however, again return to this phase of the subject; in the meantime, we would observe that the Parliamentary Bill giving powers to the Halifax Corporation to lay down, equip, and operate electric tramways, was granted last year. When the scheme of electric tramways was entered into by the corporation, it was clearly accepted that it was to be in conjunction with the existing lighting system, and it was estimated that the capital cost on the alteration of the existing buildings and provision of additional plant would be about £8,000. It



View of Tramway Generator.

was also held that the cost of providing separate plant and buildings would in all probability amount to £40,000, and there would be a proportionate increase in the cost of working.

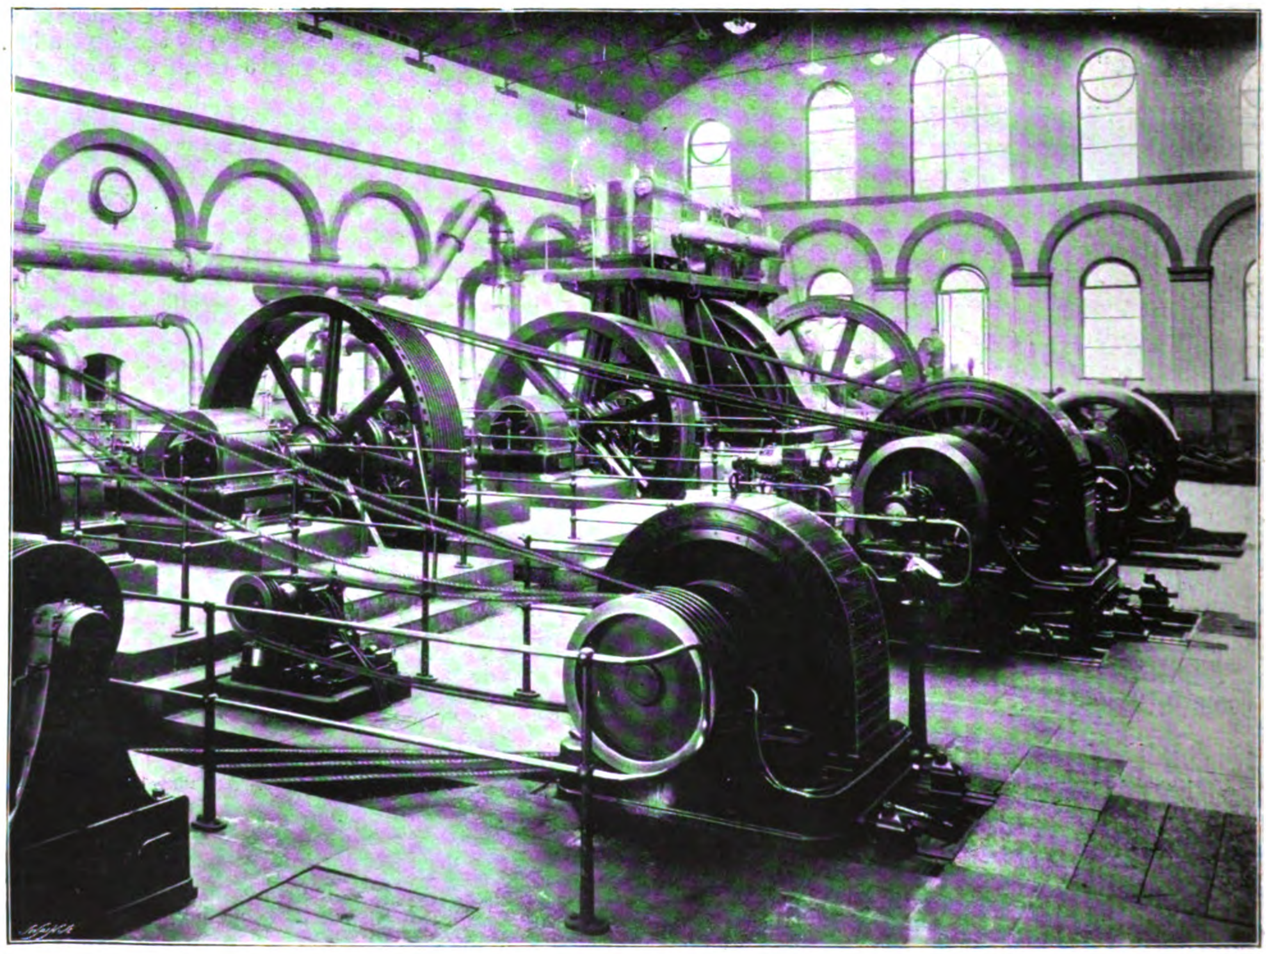
When we described the Halifax Municipal Electricity Works some three years ago,* the principal features noted were that the system was a high pressure alternating one, with sub-station and house transformers. The plant consisted of three Lancashire boilers, fitted with mechanical stokers, while the generating machinery consisted of three horizontal compound condensing engines, driving alternators by ropes. Two sets were of 100 kw. each, the third of 50 kw., and though the aggregate kw. capacity was not excessive, it proved sufficient to meet the requirements of Halifax for some time. Since our description appeared there has been some considerable extensions to the plant, chief of which is a fly-wheel alternator of 350 kw. This is driven by a compound vertical condensing engine of 600 I.H.P., fitted with Corliss valves. The dimensions of the cylinders are 18 inches × 35 inches × 3 feet, and the speed is 130 revolutions per minute. The alternator is of the fixed iron cored armature type, the revolving field magnets consisting of one winding with the poles staggered. A similar set is in process of construction, the only difference being in the dimensions of the cylinders.



Car descending Gibbet Street.

The original design of the Halifax municipal system paid great regard to the future expansion of electric lighting, and we need hardly point out that where engineers consider future developments, and arrange their buildings accordingly, the profit earning stage is not reached so early as in those systems which merely regard the demand of the moment. The lighting system has not shown a profit, though one would have been made last year if further reductions in the price of electricity had not been made.

In considering the tramway side of the undertaking in more detail, it will be convenient if we refer at this stage to the generating plant. It would be following precedent to refer to the steam-raising plant first, but in this case no additional boilers have been necessary, the spare boiler which had been provided to meet the development of the lighting having been utilised. As we have already remarked, Mr. Wilmshurst, in laying down the original plant, took some

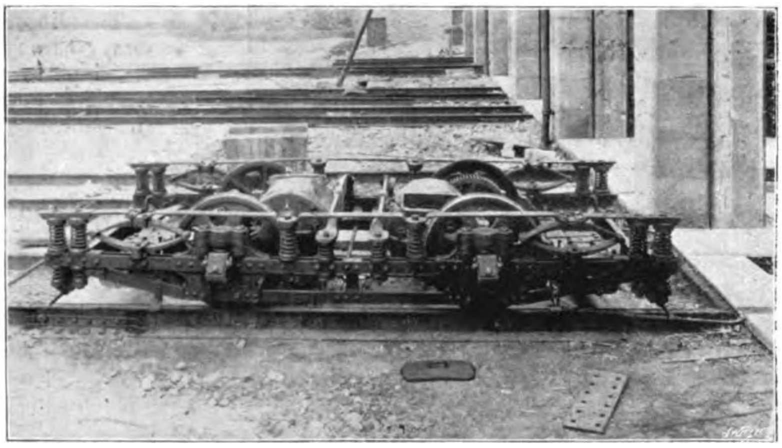


General View of Generating Station.

* February 1st, 1895.

heed for the morrow, and the addition of the tramway plant has not necessitated the extension of the buildings by a single yard, even the present considerable increase to the lighting machinery being accommodated in the original building.

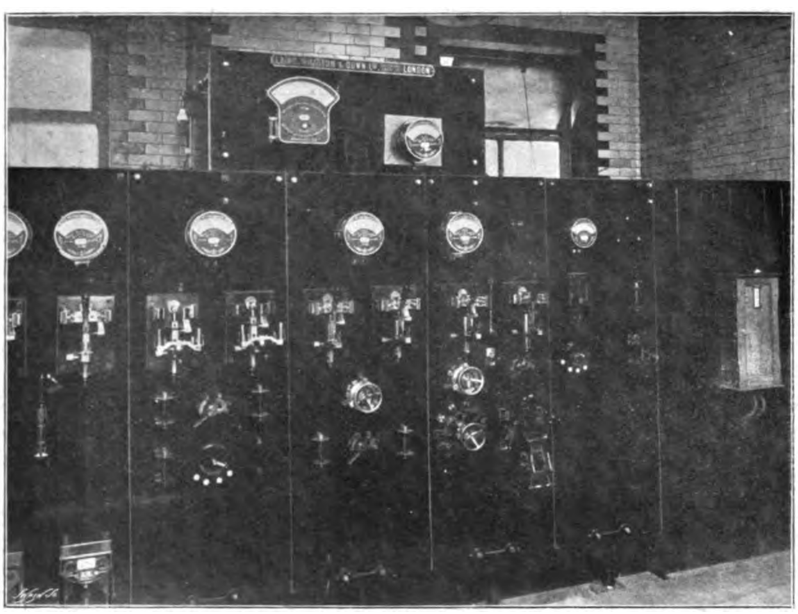
Upon entering the electricity works it is not easy, at first, to differentiate the tramway plant from that devoted to lighting, because, as will be seen by referring to the general view, the tramway generator and its engine are placed about the centre of the room, and is somewhat over-shadowed by the lighting plant that has been added during the past year.



View of Truck.

A solidly built generator, made by the Electric Construction Corporation, driven by ropes is the chief feature, indeed, at the moment, the only one of the tramway plant. The generator is of the four-pole type, having an output of 220 amperes at 500—550 volts. The engine which drives this plant was formerly employed in driving one of the lighting alternators. It does not differ very materially from the other horizontal steam motors used in these works, the only alteration being the substitution of a heavier fly-wheel than was formerly used, the increase in weight being about 100 per cent. In one corner of the building foundations are being made for a motor alternator, which will act as a kind of intermediary between the lighting and the traction systems.

This plant will consist of a continuous current machine, which will be connected by ropes to an alternating current motor. By driving this set from the alternating current circuits, the continuous current machine will be able to supply energy to the tramway circuits; but Mr. Wilmshurst is relying on this plant to be more useful than that. A battery of accumulators has been provided, and it is proposed to obtain a supply of electricity from this to drive the continuous current machine as a motor, and thus reverse the alternator for the purpose of supplying the lighting load at the time of minimum demand. This is the first instance in this country where accumulators have been used indirectly to supply electricity for alternating current circuits. Primarily, of course, the battery of accumulators has been laid down for the benefit of the tramway plant; but in Mr. Wilmshurst's programme it is destined to fill a good many parts.



Switchboard.

Practically it will fulfil three functions; firstly, it will act as a fly-wheel to the whole system; secondly, it will run the whole of the tramway service during the peak of the lighting load, and it will run the early morning cars; and, thirdly, by reversing the motor alternator, it will run the alternating lights during the hours of light load. Another important advantage of the battery from the lighting point of view, is that it will be possible, in all probability, to shut the station down at night, which will be a novel experience in an alternating system. This arrangement gives some indication of the way in which the combination of a tramway and lighting system materially helps the lighting side of the undertaking. The battery is made up of 270 cells of the well-known Chloride type. Each cell is made up of 63 plates placed in lead boxes, and the whole battery will discharge 150 amperes for 9 hours, 200 amperes for 6 hours, and 300 amperes for 3 hours. A motor-driven booster, which adds 150 volts to the traction bus bars, is provided for charging the battery.

The tramway switchboard is placed in a separate room, much after the manner of the lighting board. It will be seen from the illustration that as regards arrangement it does not differ greatly from other tramway boards. It is built up of a series of black marble panels fixed on an iron frame. It is essentially fireproof, and being built some distance from the wall, permits of easy access to the back. There are six panels:—(1) Feeder, (2) generator, (3) motor-alternator, (4) battery and booster, (5) Board of Trade, (6) voltmeters. An ammeter is provided on each board, and the feeders and generator panels are furnished with automatic cut-outs. The connections of the board are clearly shown in the diagram, but it may be observed that the instruments for testing the fall of potential in the rail are placed in a substation in the town. An Aron meter on the battery board indicates the charge and discharge of the battery.

The circuit breaker is of the Cutter type, and as we have not previously described it in these columns, the following description, taken from "Modern Switchboards," by Albert B. Herrick, may be interesting. The illustration shows the construction of this circuit breaker in side view, and in part section. "The main current circulates around the solenoidal coil, B, and tends to draw into the solenoid the movable plunger, C. The initial position of this plunger in the solenoid is determined by the adjusting screw, M. When the current is sufficient to overcome the weight of the plunger, it is drawn into the coil with constantly increasing velocity, due to intensified magnetic action, as the polar distance or air space is decreased. When nearing the upward limit of its travel, having acquired a high momentum, it impinges upon the trigger, N, through the medium of the push-pin, E. The immediate result of this is the release of the switch-arm by the displacement of the retaining catch, F. The upper projection, H, of the trigger, N, is thrust against the striker plate, K, thereby utilising the energy of the current to start the movement of the switch arm. This movement is intensified and sustained beyond the point of final rupture between the switch contacts by the thrust of the spring, O, which is released from compression by the initial action of the trigger. Thus the contact arm is thrown away from the contact terminal and the circuit is opened." Auxiliary carbon contacts are provided, which preserve the metallic contacts from the deleterious effects of an arc.

THE OUTSIDE WORK.

The line at the present moment is not a long one, and is under four miles in length, but the gradients and curves probably make it the most remarkable electric line in the country. A consideration of the sections of two portions of the line will demonstrate the natural difficulties that have had to be contended with in Halifax. We do not suppose there is a greater length of level track than 100 yards in the whole system, and in addition to the excessive gradients there are many sharp curves, one or two having a radius of only 30 feet. The section of line which traverses Gibbet Street and High Road Well is most remarkable; it is $1\frac{1}{2}$ miles in length, and from one end to the other there is a rise of over 375 feet, which practically gives an average gradient of 1 in 20. We give an illustration of the car standing at a point on the descent, but it does not altogether demonstrate the severity of the gradient. Though the present lines are steep enough, we believe the extensions, for which Parliamentary sanction has been partially obtained, include gradients of 1 in 10, which is almost equivalent to mountain climbing. We believe that an off hand opinion, based on a perfunctory survey of the town, would have declared against an electric tramway system and it is not surprising to find that cable tramway men considered electricity to be impossible. The results have completely falsified these views, and it is apparent that there are few places which cannot be worked by electrically-propelled cars. It is not surprising to learn that to propel a car up one of the gradients calls for an expenditure of current of nearly 100 amperes, practically equivalent to 65 H.P. used continuously from end to end. This is to some extent counter-balanced by the cars being able, on the return journey, to travel from one end of the line to the other without any current whatever; the cars, as a matter of fact, travelling from end to end of the line on the brakes. The question of brakes in a place like Halifax is naturally a serious one; in addition to the ordinary brake operated by hand, there is a slipper brake and an electric emergency brake provided on the cars. The slipper brakes are made to rub on the surface and in the groove of the rail, and the wear on the inner surfaces of these, which is of wood, is so great that they require to be renewed every day.

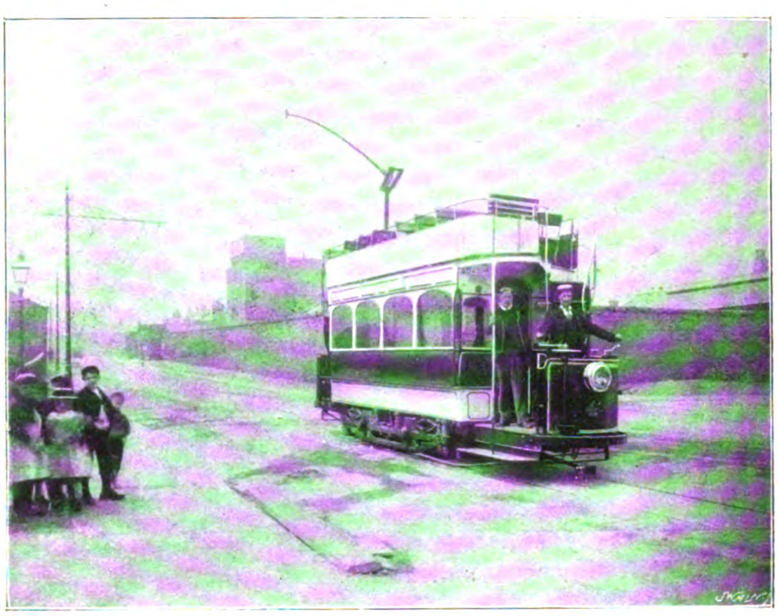
STREET VIEWS.

The slipper brake is operated by the driver through the agency of a hand wheel placed directly under the ordinary hand brake. It is obvious that the difficulties of the road call for the exercise of considerable skill in the operation of the cars, and the Halifax Corporation have engaged three or four skilled motorneers, who will drive the first series of cars and instruct new drivers.

Although the expenditure of energy to drive the car is occasionally heavy, it is quite likely that the consumption of current will not exceed one unit per car mile, owing to the cars travelling considerable distances without consumption of electric energy.

The gauge of the track is 3 feet 6 inches, the rails, which are of the girder section, weighing 98 lbs. per yard. The dimensions will be seen in the sectional drawing. The Columbia rail bond is used throughout, and is No. 0000 gauge ·46 inch. There are two bonds to each rail, cross bonds being used every 90 feet.

The principal features of this bond, which have been already alluded to in these columns,* consist of the ends or heads of the bond being placed in a thimble, which is placed in a hole in the rail. The contact of the rail and bond is made by a wedge expanding the thimble against the hole in the rail, as will be seen from the sectional drawing. The holes in the rails were drilled after the rails were laid, thus ensuring contacts being clean; the bonds were afterwards coated with tar.



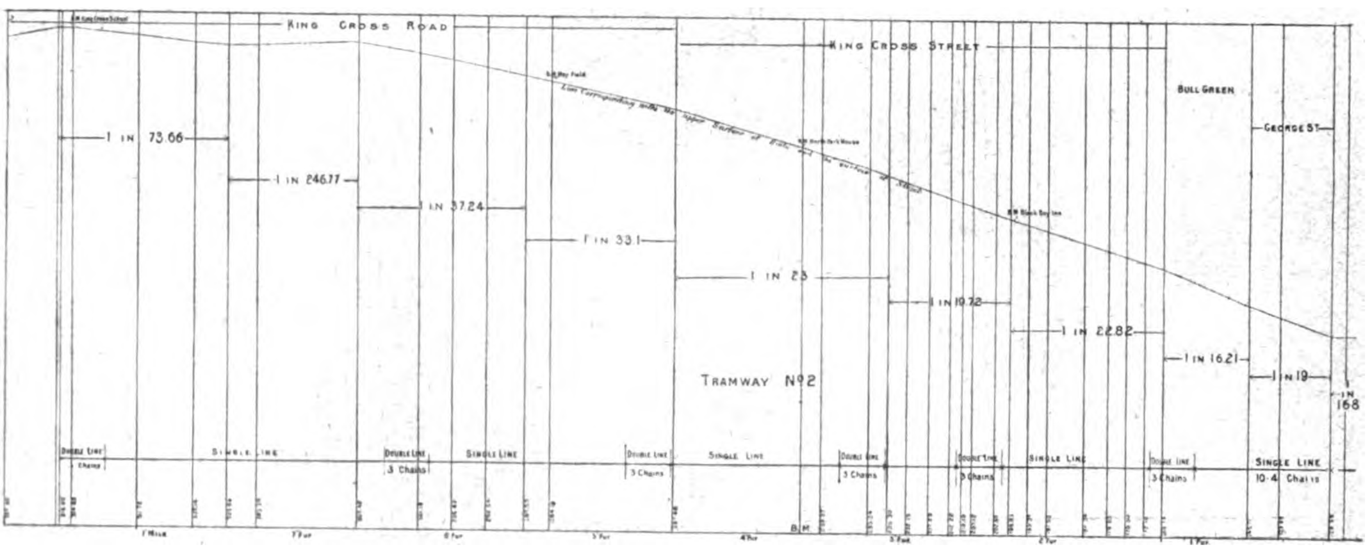
VIEW OF CAR ON LINE.

Although the line is for the most part only single track, two trolley wires are used nearly throughout the system, thus avoiding frogs. They are of 0 gauge, ·324 inch diameter, and are carried on side poles in the manner shown in the illustrations. The poles, which are of the steel tubular type, made by Messrs. Spencer & Sons, are placed 40 yards apart

* September 24th, 1897.

at the edge of the kerb, the arms supporting the trolley wire varying from 5 to 15 feet in length. In the centre of the town arc lamps of the alternating current type are suspended from the arms; the transformers for these are placed in the base of the steel posts, and the arrangement has proved so satisfactory, that an addition of 30 to the already existing 40 will be made before the winter. Owing to the large glow lamps. Outside seats are provided, the trolley of the Dickinson type being carried on a pillar some feet above the roof of the car. There is seating accommodation for 20 inside and 24 outside, the weight of each car complete being about 7 tons.

The car shed, which has been erected at the end of the Gibbet Street section, will accommodate 18 cars. It is



Section of one Route.

number of telephone and telegraph wires erected overhead, quite an elaborate system of guard wires has been rendered necessary, but with the eventual disappearance of the overheard telephone wires the necessity will soon cease. The guard wires are of galvanised iron, No. 7½, and are fixed about 2 feet above the trolley wire; they are efficiently earthed at different points. In accordance with what is now common practice, the overhead wire is arranged in half-mile sections, the boxes at these points containing four switch fuses and two Garton lightning arresters.

Two armoured feeders run from the works to a sub-station in the centre of town, and from here three cables radiate to Ward's End, King Cross, and Gibbet Street. A telephone and pilot wire cable, consisting of three 7/20 cables, is laid along side each feeder. All these cables are vulcanised bitumen. The feeders have ·15 square inch sectional area, and the return feeder (section ·33 square inch) being drawn in Doulton casing, and spare ways are left for extensions.

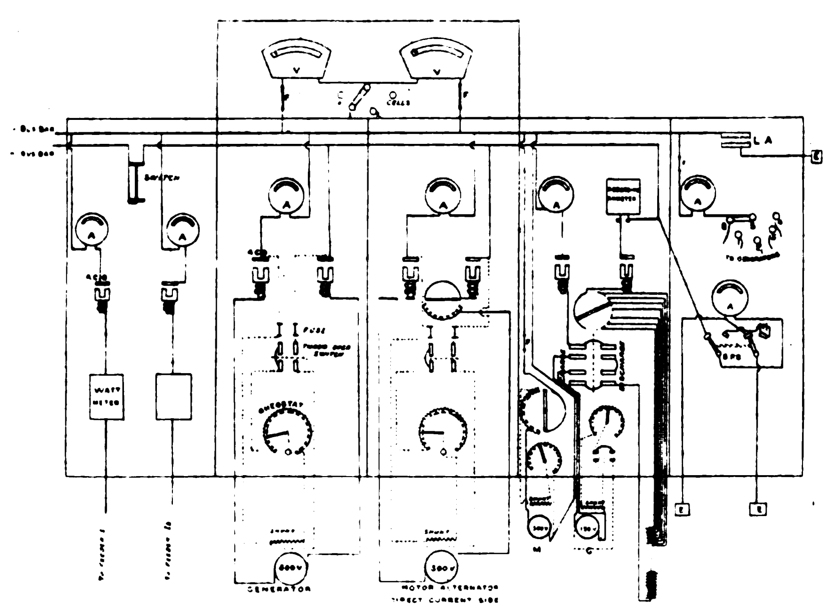


Diagram of Switchboard.

At the sub-station, which is an extension of a transformer lighting station, where the feeders are brought, feeder switches are arranged by which the various sections of the line can be controlled. At this point are also fixed the Board of Trade measuring instruments.

There are 10 motor cars at present, the trucks being of the Peckham type, having a wheel base of 5 feet 6 inches. The bodies are very similar to those employed on the Leeds lines, and are excellently designed and finished; they have been made by Messrs. Milnes & Son.

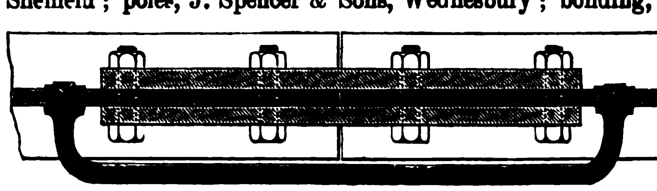
Each car is fitted with two motors of the E.C.C. enclosed type, B.T.H. controllers of the K type, and are lighted by 10

provided with inspection pits and equipped with a 6-ton travelling crane. Alongside are arranged repair shops, mess room, manager's office, &c.

It may be interesting to mention that the service of cars commences at 5.30 a.m., there being half-hourly cars till 8 a.m., when a 10-minutes' service is continued throughout the day. The two routes overlapping in the centre of the town constitute a five-minutes' service from there to the station. The speed in the town is limited to 7 miles an hour, and there are fixed stopping places.

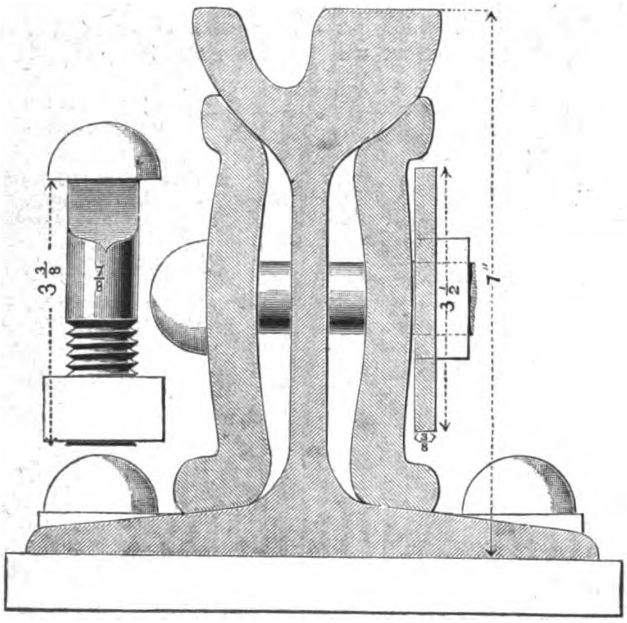
The tramways are controlled by a specially constituted Tramways Committee, which purchase current from the Lighting Committee at 2d. per unit. The Lighting Committee furnish the plant, the feeders, and the necessary feeding switches and so forth, but the rest of the equipment, including the overhead wire, is supplied by the Tramways Committee.

The following is a list of the principal contracts and contractors:—Car shed, J. Charnock and Sons, Halifax; rails, The Leeds Steel Works; points, Askham Brothers & Wilson, Sheffield; poles, J. Spencer & Sons, Wednesbury; bonding,



overhead equipment, car-trucks, motors, trolleys, generators, &c., The Electric Construction Company, Wolverhampton; car bodies, G. F. Milnes and Co., Birkenhead; accumulators, The Chloride Electric Storage Syndicate, Clifton Junction; switchboard, Laing, Wharton & Down.

The work has been superintended by the borough engineer,



SECTION OF RAIL AND FISH PLATE, AND DETAIL OF BOLT AND NUT.

Mr. E. R. S. Escott, the borough electrical engineer, Mr T. P. Wilmshurst, the traffic manager, Mr. Fred Spencer, while Mr. N. H. White has represented the Electric Construction Company.

We are especially indebted to Mr. T. P. Wilmshurst for the aid that he has given us in compiling the foregoing account of what is a most interesting system.

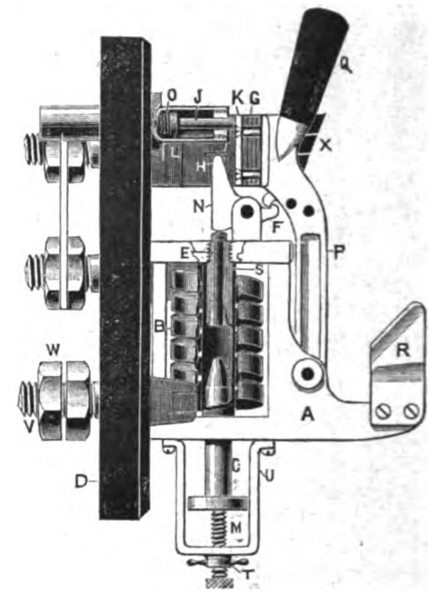
ELECTRICAL CABS IN PARIS.

THOUGH originally the spirit motor, useful enough for country work, made a fairly brave show in Paris, the electric cab seems, as in London, to be coming to the front, as it certainly ought to do in a city of asphalte paving. The cab trials of the Automobile Club just completed included only one vehicle of the petroleum order, all the rest being electrical. In fact, the Paris cab companies have made numerous experiments, which have caused them to throw over the petroleum cab and adopt electricity.

The Krieger cab, as illustrated in the *Engineer*, much resembles the electrical cabs in London. The Jeanteaud cab is after the fashion of the well known fiacre, while the cab of the Compagnié Générale des Transports was placed on a very long wheel base, and weighed 1,662 kilos by reason of possessing rapid charging accumulators, put in under a mistaken idea as to conditions to be met.

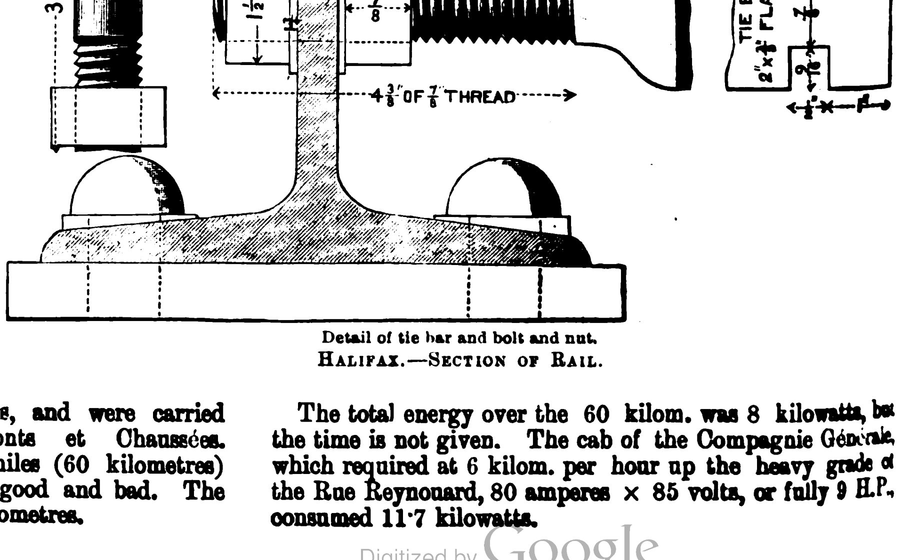
Preliminary tests were first made on the maximum speeds each cab could attain, their brake power, reversal facilities, and hill climbing capability. These were made on the gradients of Suresnes and Mont Valerian and along the Seine banks, and were carried out by M. Forestier, of Les Ponts et Chaussées. Then followed three routes of 37 miles (60 kilometres) each, of various description of road, good and bad. The average speed attained was 13 to 15 kilometres.

In the Krieger cab 866 of the total 1,360 kilos are upon the front wheels, and the cab carried three passengers and 70 kilos of baggage. Its Fulmen accumulators required seven to eight hours to charge. The front axle carries two motors geared to a toothed wheel bolted to the front wheels, which both drive and steer. The cab varied its expenditure of energy from 24 amperes at 92 volts at a speed of 18 kilom. per hour



HALIFAX.—SECTION OF CUTTER AUTOMATIC CIRCUIT BREAKER.

along the Champs Elysées and Avenue de l'Alma. It then mounted the macadam of the up grade Rue de Magdebourg at 6 kilowatts per hour, discharging 56 amperes at 85 volts, or, say, 8 H.P., next passing over bad and soft macadam at 15, 20, and 26 amperes, and finally down the Champs Elysées, registering 8 amperes, the motors now partially recuperating the accumulators. The effect of road surface was very marked. Level wood required 20 amperes, macadam 26, dry asphalte, at a lower speed, 15. Up hill at low speed, on greasy granite, 36, and again on asphalte 18, 16, and 22 amperes, according to speed.



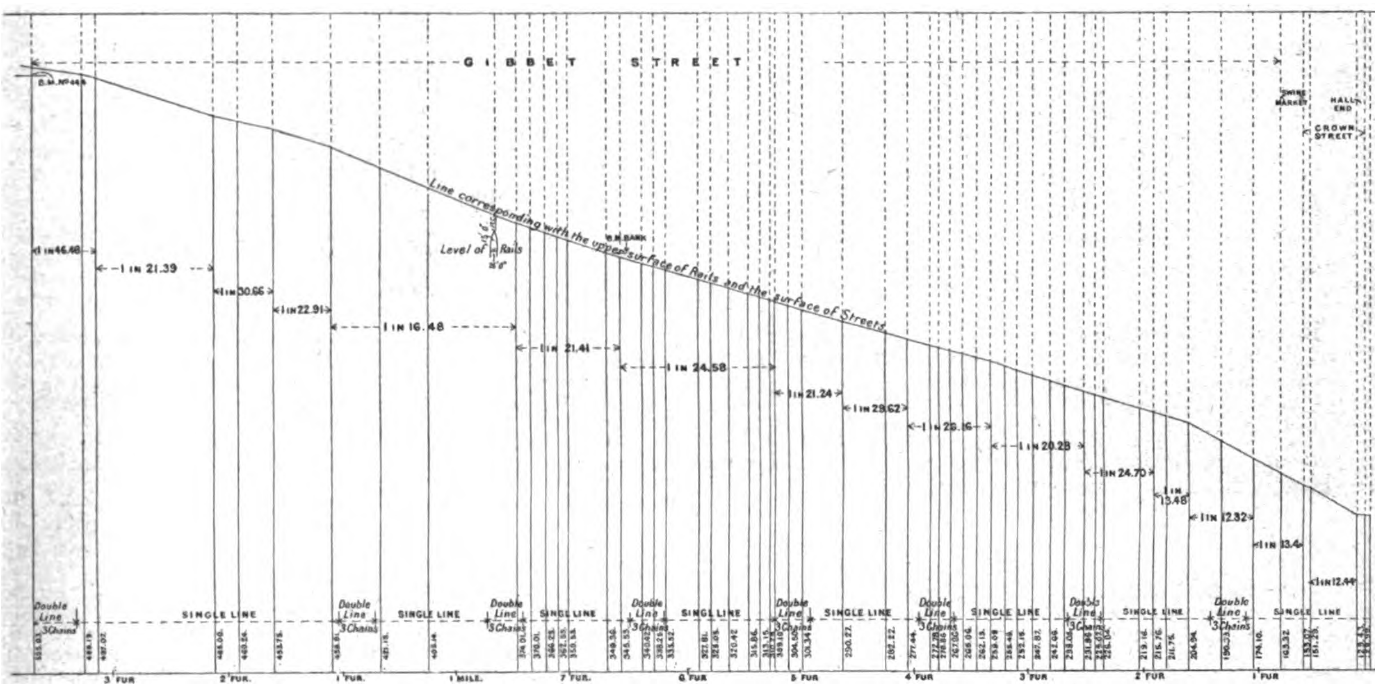
Detail of tie bar and bolt and nut.
HALIFAX.—SECTION OF RAIL.

The total energy over the 60 kilom. was 8 kilowatts, but the time is not given. The cab of the Compagnie Générale, which required at 6 kilom. per hour up the heavy grade of the Rue Reynouard, 80 amperes × 85 volts, or fully 9 H.P., consumed 11·7 kilowatts.

The Jeanteaud cab—two passengers—carried its accumulators, of Fulmen type, in front, and a simple motor geared to the rear axle. It expended at the rate of $7\frac{1}{2}$ H.P. on the Rue de Magdebourg, but on the whole course of 60 kilometres about 8·5 kilowatts in $4\frac{1}{2}$ hours, an average of about $2\frac{1}{2}$ H.P. for a very respectable speed. The Peugeot cab—with a two-cylinder motor—is well spoken of by the *Engineer*, and is faster than the electric cabs, and there is no vibration when running, though this is bad when standing—our own experience also.

It consumed 13 litres of petroleum spirit in running 60 kilometres, or say, fully $2\frac{3}{4}$ gallons, and it used at the same time $1\frac{3}{4}$ gallons of cooling water.

This corresponds with, say, 0·6 of a lb. of fuel per mile. Thus, such a vehicle would run from London to St. Albans and back, with about 24 lbs. of fuel, or, say, 3 gallons.



HALIFAX.—SECTION OF ANOTHER ROUTE.

The trials all point to the conclusion to which previous experience points, that for city work the electrical cab is coming to the front, and for country roads, less suitable for accumulators and less convenient as regards re-charging, the spirit motor will find its chief field, leaving the heavy work probably to steam. We would not at present advise the trial of electricity beyond narrow limits.

CONTRACTS OPEN AND CLOSED.

(*Continued from page* 882.)

Bulgaria.—June 27th. Some little time ago the municipal authorities of Sophia, Bulgaria, invited tenders for the concession for the electric lighting of the public streets of the city, and for the construction and working of an electric tramway. The authorities are again inviting tenders, until the 27th inst., for this concession, particulars of which may be obtained from above.

Cardiff.—June 28th. The Corporation wants tenders for two water-tube boilers for the electricity works. Particulars from the borough electrical engineer, Mr. Appelbee; also see our "Official Notices" June 17th.

East London (Cape Colony).—June 28th. The Town Council is inviting tenders for erection of buildings and the supply of electric lighting machinery, electric tramcars, plant, rails, &c., and for their maintenance for six months from completion. Particulars from Messrs. Dyer & Dyer, 17, Aldermanbury, London, E.C., on payment of £5, repayable on the receipt of a *bonâ fide* tender.

Edinburgh.—June 30th. The Corporation wants tenders for the supply of copper strip for electric conductors. Particulars from the resident electrical engineer, and see our "Official Notices" June 17th.

France.—June 30th. Tenders are being invited by the municipal authorities of St. Laurent de la Salanque, a small town of about 4,500 inhabitants in the Pyrenées Orientales, for the concession for the electric lighting of the public streets. Full particulars may be obtained from, and tenders to be sent to, Le Maire, de St. Laurent de la Salanque, Pyrenées Orientales, France.

France.—July 7th. Tenders are being invited by the French Post and Telegraph authorities in Paris for the supply of 760 metrical tons of galvanised iron wire, and 617,000 porcelain insulators. Particulars may be obtained from, and tenders to be sent to, Le Sous-Secretariat d'État des Postes et des Telegraphes, Rue de Grenelle, 103, Paris.

Hammersmith.—July 4th. The Vestry wants tenders for the supply of eight 25-kw. transformers. Particulars from the Vestry Clerk (Mr. W. P. Cockburn), Town Hall; also see our "Official Notices."

Heckmondwike.—June 30th. The directors of the Heckmondwike Industrial Co-operative Wholesale Society want tenders for an electric light installation (about 500 lights) including generating plant for their premises. Consulting electrical engineer, Mr. Walter Leake, 51, Victoria Buildings, Manchester. See our "Official Notices" June 17th.

Hull.—July 1st. The Corporation wants tenders for wiring and the supply of fittings for the East Hull Baths. Particulars from the city engineer (Mr. A. E. White). See our "Official Notices" June 17th.

Leeds.—June 29th. The Council requires tenders for two engines and dynamos of about 1,000 H.P. each; also for 50 electric tramcars. Particulars from Dr. John Hopkinson; also see our "Official Notices" June 17th.

Melbourne.—August 16th. The City Council is inviting tenders for the supply and delivery of arc lamp carbons. See our "Official Notices."

Newington.—July 1st. The Vestry of St. Mary invites tenders for the construction, supply, and erection of boilers, pumps, steam and water mains, water tank, surface condenser, fuel economiser, &c., for the electricity works in Penrose Street, Walworth. Consulting engineers, Messrs. Kincaid, Waller & Manville. See our "Official Notices" June 17th.

Shanghai.—August 10th. The Shanghai Municipal Council invites tenders for the supply of two 100-kw. direct coupled steam alternators, switchboard, and water-tube boiler. Particulars and specifications to be obtained from Messrs. John Pook & Co., 8, Jeffreys Square, St. Mary Axe, E.C., to whom tenders have to be sent. See our "Official Notices" this week.

St. Pancras.—July 12th. The Vestry wants tenders for condensing plant, steam pipes, &c., for the Regent's Park generating station, 47, Stanhope Street, N.W. Particulars from the chief clerk, Electricity Department offices, 57, Pratt Street, N.W. See our "Official Notices" this week.

Tunbridge Wells.—June 27th. The Corporation wants tenders for the electric wiring of the new baths in Monson Road. Particulars and specifications at the Borough Surveyor's Office.

Victoria.—June 24th. The Council of the city of Hawthorne (Colony of Victoria, Australia) is inviting tenders for the supply and erection of buildings, boilers, engines, dynamos, transformers, mains, meters, arc lamps, poles; also running the plant for three years. See our "Official Notices" March 11th.

Wimbledon.—June 27th. The District Council wants tenders for the installation of the electric light mains and fittings in the new depôt buildings in Queen's Road, Wimbledon. Particulars from the Council's engineer, Mr. C. H. Cooper. See our "Official Notices" June 17th.

York.—June 24th. The Corporation is inviting tenders for the erection of an electric light station. Particulars from the City engineer, Guildhall.

CLOSED.

Ayr.—The Police Commissioners have given the contract for the new electric light posts to Messrs. Macfarlane, Glasgow.

Bristol.—The City Council has given an order to Messrs. D. Parsons for electric lamp posts (£1,467) for street lighting; and to Messrs. Willans & Robinson for an additional engine at £2,255.

London.—The London County Council on Tuesday referred to committee for consideration, and report the following tenders opened for the supply of engines and dynamos for the electric lighting of the Crossness outfall works:—

J. Fowler & Co., Leeds (for two dynamos and accessories only)	£860
W. R. Renshaw & Co., Stoke	4,497
Calvert & Co., Manchester	4,600
Scott, Anderson & Beit, Sheffield	4,750
Safety Concentric Wiring Company	4,990
Laing, Wharton & Down	5,455
Edmundson's Electricity Corporation	5,530

The following tenders for cables and wiring for the same installation were similarly referred to committee:—

Fowler, Lancaster & Co.	£2,560
National Electric Free Wiring Company	2,630
J. H. Pickup & Co.	2,712
Scott, Anderson & Beit	2,770
Calvert & Co.	2,800
British Insulated Wire Company	2,898
Allingham & Fennell	2,943
H. T. Rogers	2,950
Safety Concentric Wiring Company	3,250
Laing, Wharton & Down	3,484
A. H. Wood	4,880
J. Jenkins & Sons	5,050
T. H. Taylor	5,800
G. Stegman	6,225
Sax, Slatter & Co	6,500
Walsall Electrical Company	6,912

Yarmouth.—The Council has given Messrs. Gray and Palmer the contract for electric light wiring and fitting at the Isolation Hospital, at £73 odd.

FORTHCOMING EVENT.

1898.

Friday, June 24th at 5 p.m.—Physical Society. Agenda:—1. Exhibition of an Apparatus illustrating the action of two coupled Electric Motors, by Prof. Carus-Wilson; 2. Exhibition of Weedon's Expansion of Solids Apparatus, by Mr. J. Quick; 3. "On the Theory of the Hall Effect in a Binary Electrolyte." By F. G. Donnan, M.A., Ph. D.

NOTES.

New Cable.—The cable ship, *Faraday*, left the works of Messrs. Siemens Bros. & Co., Woolwich, on Wednesday afternoon with some 670 miles of submarine cable on board for the West Indies, to the order of the West India and Panama Telegraph Company. The manufacture and testing have been supervised by Sir Samuel Canning and Mr. T. E. Gatehouse, and the cable is certainly one of the best ever made, and reflects every credit upon the contractors. Mr. Graham, of Messrs. Siemens's staff, accompanies the expedition as electrician-in-charge.

Personal.—We understand that Mr. Walter Riggs, A.I.E.E., has resigned his position as outdoor manager to the Liverpool branch of the Westminster Engineering Company, Limited, of 27—31, Regency Street, Westminster, to take up an appointment on the Peninsular and Oriental Steamship Company.

Local Authorities and Electric Lighting.—The Bill to confirm the electric lighting provisional orders which have been granted by the Board of Trade to the Vestries of Bermondsey and St. Marylebone having been referred to a Select Committee, objection has been taken, on behalf of the vestries, says the *Times*, to the right of the companies to appear before the Committee in opposition to the orders being confirmed. The question of the *locus standi* of the companies will therefore have to be decided by the Court of Referees. The companies who have lodged petitions against this Bill, and whose *locus standi* is now called in question, are the London Electric Supply Corporation, the Metropolitan Electric Supply Company, the County of London and Brush Provincial Electric Lighting Company, the Chelsea Electric Supply Company, and the St. James's and Pall Mall Electric Light Company.

The following letter on this subject has appeared in some of the London papers, from the pen of Mr. J. B. Braithwaite, jun., whose interest in electrical companies is well known:—

27, Austin Friars, E.C., *June 18th.*

Sir,—The importance to investors in electric lighting undertakings of the questions raised by the Bill now before Parliament under which the Vestries of Marylebone and Bermondsey are seeking to obtain powers to compete with existing electricity supply companies within their area, and the fact that my firm has acted as brokers to many important electric lighting issues, must be my apology for addressing you upon this subject.

Something like £5,500,000 nominal capital is now invested in electricity supply companies in the metropolis, on the security of provisional orders granted by the Board of Trade and confirmed by Parliament after the local authority had (*a*) declined to undertake the supply themselves, and (*b*) given their consent to the application for a provisional order by the company.

In most districts two companies are in competition, thus protecting the public against any fear of a monopoly. In all cases the local authority has the right to purchase the companies' undertaking at the expiration of 42 years from 1889, thus securing the reversion of the business to the ratepayers within a reasonable time.

It should be borne in mind, that under the Electric Lighting Act of 1888, the vestries and other local authorities had an equal right with any company to apply for and obtain the grant of provisional orders for the supply of electricity within their areas, and in practice the Board of Trade has always insisted upon the consent of the local authority being obtained to the application of any company for a provisional order.

The local authorities have thus had to face the question of undertaking the supply themselves in preference to allowing a company to do so, and in many cases where they decided to do so, the Board of Trade have given them the provisional order, and refused all applications made by companies. In many cases, however, after full consideration, and obtaining the best expert advice possible, the local authority decided not to undertake the supply itself, but to support the application of a responsible company in preference.

Thus, with the consent of the local authorities in various parts of the metropolis, electricity supply companies are now engaged in supplying the public, and now that the shareholders have risked their capital and through their enterprise the industry has been proved to be a profitable one, it would seem unreasonable that the local authority should be allowed to turn round and reverse its former decision and undertake the supply of electricity itself in competition with the company, whose undertaking it has the right to purchase at the end of a period of years.

Should this practice be allowed, it would be obviously extremely unjust to those who have invested their money in proving the possibility of electricity being supplied at a profit, and would effectually prevent any future companies being formed for any industrial enterprise in which in the event of success they will have to face competition from local authorities using the ratepayers' money against them.

No company can object to fair competition, but when a local authority first encourages a company to incur large expenditure, and then, when the business proves to be profitable, brings in money borrowed on the rates to deprive them of the fruits of their enterprise, it is not competition, but——

If it is desired that power should be given to local authorities to reverse the decision which many of them came to many years ago not to undertake the supply of electricity themselves, it seems only reasonable that, as a condition of the provisional order being now granted to them, they should at least be required to come to some equitable arrangement for the purchase of the company or companies which may already be supplying electricity in their district, and doubtless in Committee a clause embodying this or some other method of effectually safeguarding the interests of the existing supply companies will be introduced.

Apologising for the length of this letter,

I am yours faithfully,

J. B. Braithwaite, Jun.

The Metropolitan Electric Supply Company, Limited has issued a statement of its case against the provisional order promoted by the Vestry of Marylebone seeking powers to enter into competition with it. The memorandum concludes thus:—"Having regard, therefore, to the whole circumstances, it is very respectfully but firmly submitted that to give a local authority, without sufficient cause, power to compete with a company efficiently exercising powers granted by Parliament with the consent of that local authority, would be contrary to the intention and policy of Parliament, not only in respect of electric lighting, but also of gas, water, and tramway undertakings, and would, by the shock to public confidence, gravely discourage investment in any enterprise which depended for success on a fair and reasonable interpretation of the intentions of Parliament. It is believed that Parliament has never given powers to any corporation to compete with a company authorised by private Act or provisional order to supply gas, water, or tramway service, and if there is any precedent in the case of electric lighting, it has been created by the Board of Trade without the attention of Parliament having been directed to the question, in consequence of the confirming Bill not having been opposed."

Obituary.—The death is announced of Mr. John Henry Beckwith, M.I.M.E., who had been for the past 30 years connected with Galloways, Limited, engineers, Manchester. For the greater portion of this period he acted as works manager, and for the past 10 years, as a director of the company. He took great personal interest in the various International Exhibitions with which Messrs. Galloways' name has been closely identified, and designed many installations of engines, &c., for rolling mills, hydraulic installations, and other purposes.

We regret to hear of the death, which occurred on 14th inst., of Mr. William Rickard, the founder and sole proprietor of the Ashbourne Road Mills, Derby, where he had for years past carried on business as a wire manufacturer and coverer, and cable manufacturer. The business will continue to be carried on under the same management as heretofore.

We are sorry to learn of the death of Captain Davies, managing director of the Exchange Telegraph Company, which occurred on Tuesday last, at the age of 73. He had been managing director of the company since its inception in 1872, and, with Sir J. Anderson and Mr. Cyrus Field, was one of its founders. Prior to his connection with the Exchange Telegraph Company, Captain Davies had been in the service of the Pacific Steam Navigation Company and the Peninsular and Oriental Steam Navigation Company.

We read, with regret, in our American exchanges, of the death of Dr. Chas. E. Emery, Ph.D., which took place at Brooklyn on June 1st, heart failure being the cause. Dr. Emery was well known in America as a consulting engineer, and his name will be familiar to our readers in connection with the controversy on steam engines for electric traction. Thirty years ago Dr. Emery had charge of the construction of U.S. war and other vessels. In the eighties the Institution of Civil Engineers, London, awarded him the Telford Prize for a paper read by him. He was a prominent member of the American Society of Mechanical Engineers, and was president in 1896-7 of the New York Electrical Society, as well as a member of the American Institute of Electrical Engineers. He was a non-resident professor of Cornell University. He was also a member of the American Society of Civil Engineers. An exchange says that "he was not only an engineer in theory, but in actual practice, and had several patents for important improvements in machinery." He was connected with the New York Steam Company as consulting engineer at the time of his death.

Glasgow Technical College Scientific Society.—On 11th inst. the members of this society visited the new works of Messrs. Mavor & Coulson, Limited. At a meeting of committee held later the report of Dr. H. Dyer (convener of the teaching staff of the college) on the papers sent in for the society's annual competition, was read. The report stated that the paper on "Multiphase Electrical Machinery," signed "Electra," was a production giving evidence of considerable knowledge of the subject, and was recommended for the award. The author was Mr. A. Stewart, to whom the gold medal will accordingly be presented.

Marriage.—On 13th inst. Mr. Frank Christy, senior partner of the firm of Christy Bros., electrical engineers, of Chelmsford, was married at Leominster to Miss Clara Nellie Geaussent.

The Institution of Electrical Engineers' Conversazione.—There was a large and brilliant company at the Natural History Museum, Cromwell Road, on Thursday, 16th inst., for the Institution Conversazione. The guests were received by the President, Mrs. Swan and the Council. An excellent programme of music was performed by the string band of the Royal Engineers under the conductorship of Mr. J. Sommer. Everything passed off very satisfactorily. Among those present were the following:—

Mr. J. W. Swan, F.R.S., President.

Prof. W. G. Adams, F.R.S.
Mr. G. L. Addenbrooke
Mr. H. Alabaster
Mr J. F. Albright
Mr. L. Andrews
Prof. W. E. Ayrton, F.R.S.
Sir B. Baker, K.C.M.G., F.R.S.
Mr. Shelford Bidwell, F.R.S.
Sir A. R. Binnie
Mr. M. Blumbach
Mr. S. L. Brunton
Prof. Capper
Prof C. A. Carus-Wilson
His Excellency the Chinese Minister
Mr. Latimer Clark, F.R.S.
Mr. Dugald Clerk
Prof. F. Clowes, F.R.S.
Mr. S. Cowper-Coles
Capt E. W. Creak, R.N., F.R.S.
Mr. R. E. Crompton
Sir William Crookes, F.R.S.
Sir A. Durston, K.C.B.
Mr. H. Edmunds
Prof. Ezaroff
Mr. S. Evershed
Mr. C. E. Fagan
Mr. W. P. J. Fawcus
General Festing, C.B., F.R.S.
Prof. G. F. FitzGerald, F.R.S.
Sir W. H. Flower, K.C.B., F.R.S.
Prof. George Forbes, F.R.S.
Prof G. Carey Foster, F.R.S.
Sir E. Frankland, K.C.B., F.R.S.
Mr. E. Garcke
Dr. W. Garnett
Dr. J. H. Gladstone, F.R.S.
Mr. W. T. Goolden
M. Gyeorguiewsky
Prof. F. L. V. Harcourt, F.R.S.
General Sir R. Harrison, K.C.B. (Inspector-General of Fortifications).
Admiral Lord John Hay
Prof O. Henrici, F.R.S.
Dr. E. Hopkinson
Prof. W. H. Hudson
Prof. D. E. Hughes, F.R.S.
Mr. Holman Hunt
Lord Kelvin, G.C.V.O., F.R.S.
Prof. A. B. W. Kennedy, F.R.S.
Lord Loch, G.C.B.
Sir Philip Magnus
Mr. W. G. McMillan (Secretary
Sir Henry Mance, C.I.E.
Major-General J. Mann, R.E.
Master of the Saddlers' Company
Master of the Salters' Company
Mr. H. S. Maxim
Mr. H. W. Miller
Sir S. Montagu
Mr. W. M. Mordey
Mr. S. Morse
Mr. Kenric B. Murray
Sir Hugh Owen, K.C.B.
Major Flood Page
Sir W. Peace, K.C.M.G.
Dr. W. H. Perkin, F.R.S.
Prof. J. Perry, F.R.S.
Mr. J. Denison Pender
Mr. W. H. Preece, C.B., F.R.S. (President Inst. Civil Engrs.)
Sir A. Ramsay
Dr. W. Ramsay, F.R.S.
Mr. J. S. Raworth
The Rev. A. Robertson
Sir E. M. Shaw, K.C.B.
Mr. Dane Sinclair
Prof. R. H. Smith
Mr. James Swinburne
Mr. Cameron Swan
Sir D. Tennant
Prof. S. P. Thompson, F.R.S.
Dr. T. E. Thorpe
The Rev. Dr. Wace
Prof R. M. Walmsley
Mr. F. H. Webb
General C. E. Webber, C.B.
Mr. Henry Wilde, F.R.S. (Honorary Member)
Sir E. L. Williams
Mr. J. Wimshurst, F.R.S.
Mr Edward Woods
Sir H. Trueman Wood
Mr. C. H. Wordingham

Water-Tube Boilers in Ships of War.—Perhaps before these lines are in print an opportunity may have presented itself for testing water-tube boilers in actual war service. We are informed that the Spanish ships *Pelayo* and *Christobal Colon*, the latter an armoured cruiser, have Niclaussé type boilers, and these have been spoken of as better than the Belleville type. It is thus extremely probable that information of a practical kind may be forthcoming. We have a very poor opinion of any steam boiler, water-tube or any other kind, if exposed to the shock of a shell exploding within it. We may be wrong, but we think any injury to the boilers of a war vessel would expose such vessel to immediate defeat. Of course, the failure of one boiler, if it does not actually explode, may only result in cutting it out of service, but what of the flood of hot water and more or less escaping steam at a critical moment. Even at best a ship would be merely a floating battery; it could not manœuvre, and if it lost all its steam, it is questionable if it could work its guns. There would be neither water-power, compressed air, nor electricity.

Presentation.—Mr. J. C. A. Ward, of St. Pancras, who has been appointed superintendent of mains under the Glasgow Corporation, was, previous to his departure, presented by the St. Pancras Vestry electricity staff with a handsome gold chain with 1898 sovereign attached, upon which a suitable inscription was made.

The Parliamentary Electrical Energy Committee.—In the *Chorley Guardian* for Saturday last, Lord Balcarres, M.P. for Chorley, who, it will be remembered, was a member of the Select Parliamentary Committee on Electrical Energy (generation and supply), writes some notes regarding the Committee's proceedings. He says:—

I cannot claim that the direct results of our labours have been very satisfactory. The Committee was equally divided in opinion, and on a dozen critical occasions our votes were equal in number—four on each side. The Committee was initiated by the Lords; we sat in their House, and deliberated according to their standing orders. It is strange that in so business-like an assembly as the Upper House, there is no escape from the dilemma of a tie. The chairman has no casting vote, and when a division shows equal numbers, the question is settled in the negative. So our report is a document which few members of the Committee would accept as a solution of the problem; indeed, I question whether it satisfies a single member of the Committee; I certainly would refuse to sign it as an expression of my own opinions. However, our report is not mandatory, and the inquiry has not been useless by any means. In the first place we have collected valuable evidence from expert witnesses; we have shown how prejudicial legislation has been to the development of electrical industries, and how the consumer has been obliged to pay unreasonable prices for his light. In short, we demonstrate the urgent necessity for a careful modification of the 1882 and 1888 Acts. Moreover, this is the first time that Parliament has seriously examined the important progress of recent science. The powers of the Board of Trade are large, but they should be widened. The powers of municipal bodies are also large—so large that private enterprise is discouraged. Some corporations want to get the whole business into their own hands; the London County Council wishes to abrogate the rights of 40 local authorities in the metropolis—some of which have populations of 250,000, and even 350,000. Many technical questions arise, and it would not be of interest for me to refer to them here. One of them, however, has a general bearing upon the position of all local authorities. It is provided that, after a certain period, local authorities may buy up the local companies, or any part of their plant—mains, for instance—situated within their own area. This right was given when lighting was the prime function of electricity. Lighting is a civic, communal obligation, and the local authorities should have this privilege. When absent in the case of private gas companies, the public is protected by the sliding scale. But in a few years time lighting will be a subsidiary matter—sometimes nothing more than a bye-product. Should local authorities retain the option to purchase undertakings which supply energy in bulk for motive purposes to factories, workshops, or railways? The distinction between electricity in bulk and electricity for lighting should be defined; the task is difficult, I admit, because one concern can supply both. But discrimination is not impossible, and unless it be achieved, there will be hopeless irremediable confusion when the time for statutory purchase arrives. The Board of Trade should note that lighting is communal, and that energy for motive power is commercial. In the case of the proposal mentioned above, it will be impossible for all the local authorities interested—150 or more of them—to agree among themselves as to the purchase of a huge undertaking which has mains under every authority, transforming stations under others, and one vast generating engine house in the district of a country authority. One might as well ask a group of local authorities to buy up a railway company or the Manchester Ship Canal. Is it not a fit subject for legislation?

The Blackwall Disaster.—It is the unexpected that happens, and surely in the whole category of accidents, nothing more unforeseen than the terrible calamity with which the launching of the warship *Albion* terminated has ever occurred. The sympathy of everybody in the United Kingdom will be extended to the relatives of the unhappy victims of this act of thoughtlessness—for it appears that no blame can be attributed to anybody but to those who became immersed—and also to Mr. Hills and the staff of the Thames Ironworks in this their hour of trial. Especially will electrical men feel for the young electrician, who, if report is to be credited, was suddenly confronted with the dead bodies of his aged mother and young, recently married, sister, who were brought into the dynamo room where he was in charge, and which, for the time, was turned into a mortuary.

The "Arc Works" Sports.—The annual sports in connection with the Arc Works' club (Messrs. Crompton & Co., Limited) took place on Saturday at Chelmsford, in glorious weather. There were 19 events.

Municipal Corporations Association.—On 14th inst. a meeting of the Municipal Corporations Association was held in London to consider, among other things, the Manchester Carriage and Tramway Company's Bill, the Midland Electric Provisional Order Bill, and the General Power Distributing Company's Bill, all of which propose to supply electrical power in bulk to the local authorities and private consumers. The secretary was instructed to watch the progress of the Bills in Parliament, and should the exigencies of the situation require concerted action, to call a further meeting of the Corporations Association.

Electric Search Lights as Weather Signals.—The *Monthly Weather Review* for February contains a note (reproduced in New York *Science*) on the use of electric search lights for the purpose of disseminating weather forecasts. The search light of the U.S.S. *Maine*, which was at the time nearly completed, was, in February, 1895, loaned by the Navy Department to the Weather Bureau for temporary use in Chicago, in experiments designed to test the efficiency of such a means of distributing warnings of coming important weather changes. The light, which had a lens 30 inches in diameter, and whose candle-power was estimated at about 100,000, was erected on the roof of the Auditorium Building in Chicago, at an elevation of 270 feet above the level of the street. It was used but once, on February 28th, 1895, in giving a warning of a coming cold wave, the light being slowly revolved at the rate of one revolution in five minutes. The night was dark and cloudy, and the signal was seen at a distance of 20 miles. A number of experimental trials were also made, and it was concluded that search lights are not useful for the purpose of disseminating forecasts except under the most favourable circumstances. The compiler of these "Notes" recalls that a number of years ago a similar attempt was made during one summer to flash weather forecasts from the summit of Mount Washington, in New Hampshire (6,279 feet). This was a private enterprise, in the nature of an advertisement, but was fairly successful as far as the distribution of the forecasts was concerned.

The Telephone an Aid in Emergency.—Several dramatic incidents were reported in connection with the flood at Shawneetown, Ill., a few weeks ago, but, says the *Western Electrician*, none possess more interest than the heroic attempts that were made by the telephone company's employés to give the alarm and summon relief. Cypress Junction, which is five miles from the scene of the flood, was the first place to hear the news. The bulletin came by long-distance telephone. It was of dramatic and horrible brevity: "The levee has broken! The water is rushing in from the bend a mile and a half up the river. Already 250 people are drowned in the lower part of town, and——" At this point the operator sending the message ceased speaking, the wires went down, and all efforts to regain connection with Cypress Junction failed. A few particulars were received at Evansville, Ind., some time afterward. Two citizens of Shawneetown who had escaped the flood rowed a skiff to a small town near by, and telephoned the brief facts of the catastrophe. They had but few details to give. An appeal for aid was received by the Mayor of Evansville later in the evening. The message was transmitted by a telephone lineman, who climbed a pole four miles above Shawneetown and made a temporary connection to call for aid. Other towns in Indiana were also notified and a few details were thus gathered. The manager of the telephone exchange at Shawneetown gave Mount Vernon its first definite news of the big inundation at the little city down the Ohio River. His message contained the following statement:—"I am four miles from Shawneetown now. I escaped, and made my way here with a portable telephone. I climbed up a telephone post and made a connection, and that is how you are getting the news." The telephone company's employés proved themselves to be heroes of the occasion. Their energetic and intelligent efforts ensured immediate relief for the sufferers, and demonstrated again in no unmistakeable manner the importance to every community of electrical communication with the outside world. Had it not been for the telephone, neighbouring cities could not have been notified of the dire necessities of the people of Shawneetown, and relief expeditions could not have been summoned as speedily as they were in this case.

Smoke Nuisance.—The Metropolitan Electric Supply Company, Limited, were summoned at Bow Street on Wednesday for not complying with a magisterial order calling upon them to abate a smoke nuisance. It will be remembered that the company was fined for a number of cases on May 18th, but the nuisance was not abated. Counsel on behalf of the St. Giles Board of Works said that there were about 30 other summonses since the last cases were heard. It was shown that the company were using the best coal now in the market, but to prevent smoke with this coal they would be bound to reconstruct their furnaces, which would take 10 or 12 months, and involve enormous expense. After a lengthy hearing, Sir James Vaughan said he was satisfied that the company had done all in their power to mitigate the nuisance, and marked the summonses "No conviction." It was stated that the prosecution was forced on the Vestry by the L.C.C.

A batch of similar summonses against the Charing Cross and Strand Electric Supply Corporation were withdrawn by the St. Martin's Vestry.

A Danger in Using Gas Voltameters.—Users of gas voltameters should bear in mind that gases prepared by electrolysis are reputed to possess great activity. They will know what is meant by the active condition of a gas. In the *Zeitschrift für Elektro-Chemie*, Vol. 4 (14), page 342, F. Winteler discusses this subject, and points out a danger which is certainly associated with the use of gas voltameters. When the oxygen and hydrogen are collected together in one tube, it may happen, when the tube is nearly full of the explosive mixture, that the electrodes project into the gas. If the electrodes possess the power of occluding gases they may cause an error by inducing the slow recombination of the gases, or the recombination may be so rapid as to produce an explosion. In any case, this is due to the occlusion of the gases by the electrodes, and not to any special activity of the gas. Reference is also made to another source of error in voltameters, viz, the solubility of the oxygen in the electrolyte, and its diffusion to the cathode, where it is again reduced.

NEW COMPANIES REGISTERED.

Alliance Electrical Company, Limited (57,770).—Registered June 14th, with capital £1,000 in £1 shares, to carry on the business of electricians, electrical, gas, and mechanical engineers, artificers in metal and wood, slate workers, suppliers of electricity, and electrical apparatus manufacturers. The subscribers (with one share each) are:—J. E. Coles, Llewellyn, West Chislehurst Park, Eltham, engineer; C S. Northcote, Harefield, South Sydenham Park, electrical engineer; T. Jons, Enderby, King's Norton, Worcester, electrical engineer; W. R. N. Grimley, 3, Marlborough Road, Ealing, W., engineer; W. Nicholson, 10, Barnsbury Grove, N., accountant; H. L. Ashford, 104, Ritherdon Road, Upper Tooting, designer; J. W. H. Humphreys, 177, Beston Road, Hanwell, manager. The number of directors is not to be less than two, nor more than five. The subscribers are to appoint the first. Registered office, 8, Heddon Street, W.

Medical Electro-Thermic Generator Company, Limited (57,773).—Registered June 14th, with capital £5,000 in £1 shares, to acquire the invention of A. E. Greville, for the application of heat electrically produced for medical purposes, and to manufacture, sell, and deal in medical, electrical, and thermal appliances. The subscribers (with one share each) are:—J. S. Jarvis, 2, Staple Inn, W.C., solicitor; H. E. Greville, 2, Staple Inn, W.C., solicitor; G. Hickson, Towcester, Northamptonshire, clerk; H. Stedman, Towcester, physician; H. B. P. Lomas, Buxton Hydro., Buxton, proprietor; J. E. Harburn, Thorncliffe, Buxton, surgeon; T. W. Precious, 1, Norland Gardens, Norland Road, W., clerk. Registered without articles of association. Registered office, 2, Staple Inn, Holborn, W.C.

Stiens & Earle, Limited (57,784).—Registered June 15th, with capital £20,000 in £1 shares, to adopt an agreement with P. Stiens and E. J. V. Earle, and to carry on the business of electricians, electrical, mechanical, and consulting engineers. The subscribers (with one share each) are:—H. Tyler, Old Hall, Thurmaston, Leicester, boot merchant; A. E. Bennett, Bella Vista, Streatham, S.W., electrical engineer; E. Earle, Porchester Lodge, Streatham Common, clerk; H. Le Marchant, Stoneleigh, Clapham Common, merchant; H. R. Mann, 53, Claremont Road, Highgate, clerk; J. Weaver, 5, Applegarth Road, Brook Green, W., manager; H. Pope, Carnbrea, Palace Gates Road, Wood Green, secretary. The number of directors is not to be less than two nor more than seven. The subscribers are to appoint the first. P. Stiens and E. J. V. Earle are to join after allotment; qualification, £100; remuneration as fixed by the company. Registered office, 139, Queen Victoria Street, E.C.

Hiram S. Maxim Electric Lighting and Engineering (Pioneer) Syndicate, Limited (57,800).—Registered June 16th, with capital £10,000 in £1 shares, to acquire a certain invention as applied to electric lighting by H. S. Maxim, and to carry on the business of electricians, mechanical engineers, suppliers of electricity, and electrical apparatus manufacturers. The subscribers are:—J. de Meray, 1, Rutland Gate, S.W., gentleman, 4,000 shares; F. A. English, Addington Place, Surrey, landed proprietor, 4,000 shares; J. T. Thompson, 116, Nevill Road, Stoke Newington, gentleman, one share; M. Devenish, 7, Cavendish Place, W., gentleman, one share; F. Cook, 53, Greyhound Road, Kensal Rise, N.W., clerk, one share; C. F. Gillard, 95, Queen's Road, N.E., gentleman, one share; A. J. Rawlinson, First Avenue Hotel, Holborn, surveyor, one share. The number of directors, and the names of the first, are to be determined by the subscribers; qualification, £100; remuneration as fixed by the company. Registered by Williams & Neville, Winchester House, E.C.

Doe Portable Electric Light and Power Syndicate, Limited (57,803).—Registered June 16th, with capital £40,000 in £1 shares, to adopt an agreement with G. O. Scott, and to acquire, develop, and turn into account any patents relating to the production, treatment, storage, application, distribution, and use of electricity. The subscribers (with one share each) are:—P. Dawson, 5, Nevern Mansions, South Kensington, engineer; J. E. Ward, Broad Street House, E.C., chartered accountant; H. Lomas, 47, Church Road, Wimbledon, engineer: H. H. Broadley, 14, Warwick Street, Pall Mall, late captain; E. R. James, Denstone, Culverden Road, Balham, engineer; W. J. Bidley, 11, Henry Street, Kennington, accountant; W. W. Borman, 39, Victoria Street, S.E., engineer. The number of directors is not to be less than three nor more than seven; the subscribers are to appoint the first. Qualification, 250 shares; remuneration as fixed by the company. Registered by C. Dickinson, 39, Victoria Street, S.W.

Vice Versâ Portable Electric Lamp Syndicate, Limited (57,806).—Registered June 16th, with capital £40,000 in 10,000 preferred and 30,000 deferred shares of £1 each, to acquire British patents Nos. 10,444 and 18,628, of 1897, for "improvements in portable electric batteries" and "improvements in portable electric primary batteries," to adopt an agreement dated June 7th with C. H. Cole, and to develop, turn into account, and deal in such patents. The subscribers (with one share each) are:—F. D. Kinnell, 35, Great St. Helens, E.C., manufacturer; T. F. E. Kinnell, Hotel Victoria, S.W., gentleman; F. J. Marriott, 35, Great St. Helens, E.C., secretary; J. G. Hillam, 30, Moorgate Street, E.C., financial agent; J. J. Beaven, 32, Old Jewry, E.C., engineer; W. R. Reece, 36, Copthall Avenue, E.C., agent; M. R. Field, 36, Copthall Avenue, E.C., agent. The number of directors is not to be less than two nor more than five. The subscribers are to appoint the first. Qualification, £100; remuneration, 10 per cent. on the net profits divisible. Registered by J. A. Bartrum, 9, Old Jewry Chambers, E.C.

CITY NOTES.

The Drop in Shares.

The following table shows the fall in the market quotations of Electric Lighting Companies' ordinary shares since March 9th.

	March 9th.	June 22nd.
Charing Cross	13½—14½	11—12
Chelsea	11½—12	7½—8½
City of London	28—29	25—26
County of London	14¾—15¾	12—13
House-to-House	11—12	8—9
Metropolitan	20½—21½	14—15
Notting Hill	20—21	15—16
St. James	18½—19½	15—16
Westminster	17½—18½	14½—15

It is hardly necessary to say that this extraordinary fall is due to the unreasonable scare following on the granting of an electric lighting order to the Marylebone Vestry.

Official Announcements re Companies.

The *London Gazette* for June 17th contains notice by the Registrar of Joint Stock Companies to the effect that the following have been struck off the register and are dissolved:—

Birmingham House-to-House Electricity Company.
Caustic Soda and Chlorine Syndicate.
Electrical Accessories Company.
Electric Light and Power Share Trust.
Exeter Electric Light Company.
Irish House-to-House Electricity Company.
Lancashire and Cheshire House-to-House Electricity Company.
Liverpool House-to-House Electricity Company.
Manchester House-to-House Electricity Company.
Midland House-to-House Electricity Company.
Nightingale Automatic Electrical Machine Company.
Northern House-to-House Electricity Company.
Pacific Telegraph Company.
Railway Electrical Fog Signal Syndicate.
Railway Electric Reading Lamp Company.
South of England House-to-House Electricity Company.
Universal Arc Lamp Syndicate.
Western House-to-House Electricity Company.
Wrexham and District Electric Supply Company.

Notice has been given that the following will be struck off in three months unless cause is shown to the contrary :—

Automatic Electric Sign Company.
Canterbury Electricity Supply Company.
Electric and Automatic Engineering Company.
Electric Guest Call Company.
Electric Light Regulating Syndicate.
Electric Time Distributing and Clock Company.
Electro-Mechanical Photographic Syndicate.
Engineering Review, Limited.
Gloria Electrolytic Incandescent Light Company.
"Harp" Arc Lamp Syndicate.
Knooferl-Bonn Dental and Electrical Manufacturing Company.
Manchester Suburban Electric Supply, Limited.
Pioneer Syndicate of the Capital and Counties Electricity Supply Company.
Silicon Electric Lamp Syndicate.
Town and Village Electric Light and Power Company.
West Australian Electrical Trunk, Power and Lighting Company.

The Electric and General Investment Company, Limited.

The report of the directors to be submitted to the ninth ordinary general meeting of the shareholders to be held at Winchester House, Old Broad Street, London, E.C., on Tuesday, June 28th, 1898, at 3 p.m., states that the profit and loss account shows a gross profit on the transactions of the year of £31,946 13s. 8d., and after deducting all general charges, and the interim dividend already paid on the ordinary shares, there remains a net balance of £25,719 1s. 10d. available for distribution. The directors recommend that this sum be dealt with as follows :—

	£	s.	d.
Ordinary Shares—			
To the payment of a further dividend at the rate of 30 per cent. per annum for the six months ended May 31st, 1898	£3,000	0	0
To the payment of a bonus of 10 per cent. for the year ended May 31st, 1898	2,000	0	0
These payments, with the interim dividend of 10 per cent. previously paid, will make a total distribution of 35 per cent. for the year upon the capital paid up on the ordinary shares.			
Founders' Shares—			
To the payment of a dividend of £30 per share for the year ended May 31st, 1898	3,000	0	0
To the payment of a bonus of £20 per share for the year ended May 31st, 1898	2,000	0	0
Ordinary Shares Reserve Fund—			
To the payment to the trustees of such fund of...	7,859	10	11
Founders' Shares Reserve Fund—			
To the payment to the trustees of such fund of...	7,859	10	11
	£25,719	1	10

The above-mentioned payments will be subject to the deduction of income-tax.

The trustees for the founders' shares reserve fund propose to distribute to the holders of such shares a sum of £20 per share out of the proceeds of investments sold and dividends received in respect of the fund, making a total distribution of £70 on each founders' share. The directors retiring this year are Mr. George Herring and Mr. B. H. Van Tromp, who, being eligible, offer themselves for re-election. The auditor, Mr. G. T. Rait, also retires, but offers himself for re-election. It is proposed to make the dividends payable on June 28th, 1898.

Greenwood & Batley.

The report of the directors of Greenwood & Batley, Limited, for the year ended March 31st last, to be submitted at the general meeting to be held in London on 25th inst., states that, after providing for the interest on the debentures and for the expenses of management, writing off the sum of £2,500 for depreciation, and making a provision of £500 for doubtful accounts and allowances, the accounts show a net profit of £8,658, to which has to be added the balance brought forward, £1,409, making a balance now available of £10,067. The directors recommend that out of this sum a dividend of 7 per cent. should be paid on the cumulative preference shares, which will absorb £7,028, leaving a balance of £3,039 to be carried forward. An agreement has been entered into under which the company has sold its Russian business to the Russian Engineering Company, Limited, for £19,000, payable half in fully-paid ordinary shares and half in fully-paid 6 per cent. cumulative preference shares of that company. The amount received has been written off capital expenditure. Although under this agreement the goodwill of the Russian business is transferred to the Russian Engineering Company, Limited, it is stipulated that this company shall act as the sole agents of the Russian company for the purchase in England of all materials, machinery, or other articles, and are also to manufacture all such special machinery or parts of machinery as that company may require from England for the next 25 years, and a considerable business has already resulted under these conditions. The directors considered it necessary to join the federated engineering employers in resisting the 48 hours' demand, and this action brought about a strike which practically stopped the producing power of the works for seven months out of the year under review. The works are fully employed at the present time, and the contracts on hand and in negotiation give good reason to hope that the business of the present year will be remunerative. The plant, buildings, and machinery have been maintained in efficient working order and condition, £5,176 having been expended during the year under this head, and charged to revenue. The directors regret the loss of their colleague, Mr. George Greenwood, who had acted as a managing director of the company since its formation, and who died in April last.

Birmingham Electric Supply Company, Limited.

The shareholders of this company met at the Queen's Hotel, Birmingham, on Friday last, Mr. H. Buckley (chairman) presiding, to consider the proposed sale of the undertaking to the Corporation. The proceedings were conducted in private. It was understood that the following resolution, moved from the chair, and seconded by Mr. G. Albright, had been carried with practical unanimity :—"That the provisional agreement produced and read at this meeting providing for the sale of the company's undertaking and assets to the Corporation of Birmingham, at the price and upon the terms therein stated, be approved, and the directors of the company be requested to take all necessary steps to carry such agreement into effect." A further motion was unanimously adopted, moved by Mr. G. H. Kenrick, and seconded by Colonel Wilkinson, granting the directors a sum of £2,000 for their services.

Davey, Paxman & Co., Limited.—The prospectus of this company, inviting applications until yesterday afternoon for £100,000 4 per cent. first mortgage debenture stock at 102 per cent., has been before the public this week. This well-known engineering and boiler-making firm of Colchester has now more orders on hand than at any previous date, and it has become necessary to erect new shops, and to provide additional plant and further working capital, for which £30,000 of the present issue of debenture stock will be appropriated. The assets, exclusive of goodwill and the value of patents and licenses, are put at £175,132. Messrs. Bramwell & Harris, and Wheatley Kirk, Price & Goulty, have made a valuation, and this accompanies the prospectus.

The Electrical Company, Limited.—This company which is the English branch of the Allgemeine Electricitäts Gesellschaft, has had, we understand, a successful year's work. The net profit for the year ending March 31st, 1898, after writing off for depreciation, doubtful debts, and for the whole of the furniture, cost of accumulators, dynamo, wires, &c., was £2,3€4. The reserve fund has been increased by £750; £490 has been distributed to directors, managers, and as bonuses to employés, and a dividend declared of 10 per cent.

Electric Horse Promotion Syndicate.—The *Star* of 17th inst. says that the directors of the Electric Horse Promotion Syndicate, Limited, "have returned to subscribers for the shares the amounts of their subscriptions. We also learn that the inventor of the electric horse apparatus, Mr. A. H. R. Pulman, through his solicitor, Mr. Sydney C. Peters, of 81, Cannon Street, E.C., has given notice for the rescission of the contract, dated February 7th, 1898, for the sale of the patent rights of the said invention."

Eastern Extension, Australasia and China Telegraph Company.—The directors of the Eastern Extension, Australasia and China Telegraph Company, Limited, have declared an interim dividend for the quarter ended March 31st last of 2s. 6d. per share, free of income-tax, payable on July 15th. The coupon on the company's 5 per cent. Australian Government subsidy debentures, due on July 1st next, will be paid on and after that date at Messrs. Barclay & Co.'s bank.

The Shannon Electric Power Syndicate, Limited.—Sir Henry Grattan-Bellew, Bart., of Mount Bellew, County Galway, has been elected to the directorate of this syndicate, in place of Mr. J. Bannatyne, resigned.

TRAFFIC RECEIPTS.

The Bristol Tramways and Carriage Company, Limited.—The receipts for the week ending June 1[illegible]th, 1898, were £2,835 12s. 4d.; corresponding period, 1897, £2,441 6s. 4d.; increase, £394 6s.

The City and South London Railway Company.—The receipts for the week ending June 19th, 1898, were £974; week ending June 20th, 1897, £1,093; decrease, £119; total receipts for half-year, 1898, £25,532; corresponding period, 1897, £25,308; increase, £224.

The Dover Corporation Electric Tramways.—The receipts for the week ending June 18th, 1898, were £152 6s. 9d.; total receipts to June 18th 1898, £2,851 2s. 6d.

The Dublin Southern District (Electric) Tramways Company.—The receipts for week ending Friday, June 10th, 1898, were £748 2s. 5d.; corresponding week last year, £814 0s. 9d.; decrease, £65 18s. 4d.; passengers carried, 110,303; corresponding week last year, 121,265; aggregate to date, £11,711 12s. 6d; aggregate to date last year, £12,362 6s. 4d.; decrease to date, £650 13s. 10d.; mileage open, 8 miles.

The Liverpool Overhead Railway Company.—The receipts for the week ending June 19th, 1898, amounted to £1,440; corresponding week last year, £1,389; increase, £51.

The Western and Brazilian Telegraph Company, Limited.—The receipts for the week ending June 17th, 1898, after deducting 17 per cent. of the gross receipts payable to the London Platino-Brazilian Telegraph Company, Limited, were £2,982.

SHARE LIST OF ELECTRICAL COMPANIES.—TELEGRAPH AND TELEPHONE COMPANIES.

THE MUNICIPAL ELECTRICAL ASSOCIATION, 1898.

ELECTRIC TRACTION.

By Robt. C. Quin, A.I.E.E., B.E. and T. Engineer, Blackpool.

It goes without saying that the subject of electric traction is so important and extensive that it is impossible to deal with it comprehensively in a paper of this description. The author proposes, therefore, to set forth as briefly as possible the salient points of the subject and to invite discussion upon them, rather than to detail at length any particular system or systems of electric traction.

Road.—In the author's opinion, the road, or permanent way, is one of the chief factors which determine the success or failure of any electric traction undertaking, inasmuch as its condition will have a much greater effect upon the maintenance costs, and consequently, the financial result, than would probably be the case with any other system of traction.

Considerable difference of opinion seems to exist as to how this track should be constructed—whether the rails should be 43 lbs. per yard as upon the Giant's Causeway line, or 92 lbs. per yard as upon the Blackpool line—whether the gauge would be 3 feet or standard gauge.

The weight of the rail must, of course, be proportioned to the weight of the cars running thereon, and to the soil upon which the rails are laid; but it would appear to the author that the present practice errs too much on the side of lightness.

It will be admitted on all hands that smooth running is essential to the longevity of the rolling stock; and that this cannot be attained without rigidity of construction, smoothness of running surface, and accuracy of gauge.

In order to insure these desirable ends it is essential, in the first place, that the track should be well laid on a good solid foundation, accurately gauged, and substantially cross-tied. The usual cross-tie for tramways purposes is 1½ inches by ½ inch strap hammered round at each end, and threaded and bolted through the web of the rails; but at Hamburg—at which place it has been the author's privilege to investigate the permanent way construction—things are done on a decidedly better plan. Here the rails, which weigh 106 lbs. per yard, are cross-tied by an I shaped girder, 4 inches deep, which passes under the bottom flanges of both rails, and is secured at each end by two substantial and adjustable chairs. These ties are placed about 6 feet apart.

The rails also are not butt jointed, but have a half and half lap joint, with a longitudinal cut through the web about 10 inches in length. The fish plates securing these are 2 feet 10 inches long fastened by six ⅞-inch bolts. The fish plate on the tread side of the rail passes under the bottom flange as far as the web.

This class of rail joint is one which, in the author's opinion, very nearly approaches the ideal. It has unbroken running surface, is rigidly constructed, and has a large rail to rail contact.

The cross-over roads at Hamburg are also of unique construction. At these points the groove of the rail is gradually shallowed until at the actual crossing point it is ⅜ inch as against 1¼ inches at other parts of the rail. The flange of the wheel projects 1 inch; hence at these points continuity of running surface is attained by riding on the flange of the wheel.

Generator.—Shall it be high speed, slow speed, direct coupled, belt, or rope driven: if with the latter shall the fly-wheel be placed upon the engine or the dynamo—are questions which have been ably dealt with in the technical press by Mr. J. S. Raworth. On the question of fly-wheels, the author begs to state *his* opinion that the fly-wheel should be left at the factory, as there is quite sufficient fly-wheel effect in a tramcar. The author further ventures to suggest that what is required is not so much uniform speed of the engine, or uniform E.M.F. of the line, as uniform motion of the tramcars, and, in his experience, neither of the former are absolutely essential to the attainment of the latter.

Slow speed engines, direct coupled and belt driven alike, are doing good service in traction work, both in this country and on the Continent. But of these, so far as regards modern plant, he cannot speak from personal experience. He has within his charge for lighting purposes, however, engines varying in speed from 80 to 5,000 revolutions per minute. The traction plant is of the latter order, *i.e.*, direct coupled, Parsons steam turbines, electrically governed. These turbines have been working since June, 1897, to the present time, and seem well adapted for the purpose. Their efficiency is extremely good; the attention and cost of up-keep at present extremely small, while the automatic regulation is everything that could be desired.

The extent to which this range of regulation is called upon depends, of course, in a very large measure, upon the weight of the cars, the number of starts per hour, the gradients, and, finally, the starting gear.

Motors.—Gearing and Starting Arrangements.

Motors.—The motors for traction purposes should certainly be of the enclosed type, as far as possible watertight; and their capacity such as to enable them, on an emergency, to develop, for short periods, at least three times their normal power.

The truck, carrying the motor or motors, should be rigid in construction—flexibility being given solely to the supports of the car body, and of the motor.

The efficiency of a traction motor, though, of course, an important point, is not of such great moment as with stationary motors. The question of weight, as well as efficiency, has to be considered; and the question, after all, amounts solely to how much power it will require to move the total weight of car, equipment and passengers, a given distance at a given speed, on a given length of track.

The efficiency, again, should be greatest at certainly not more than three-quarters of the maximum power of the motor, or preferably at its usual working load.

The arrangements for oiling should be such, that while giving efficient lubrication, oil should not be able to obtain access to the inner portion of the case. Certain makers of traction motors now cover the bottom coil of the field magnet with sheet lead. This is a good preventative of failure due to the access of moisture, dirt, or oil; but it would be better if these could be entirely excluded.

In the author's experience the weakest point in a traction armature is at the junction of the winding and the commutator. Great flexibility should be allowed at that point, and the armature coils and laminations cannot be too rigidly fixed. The sudden starting with heavy loads on heavy gradients is very apt to spring the windings, and snap their connection with the commutator.

There seems at present to be no settled practice as to the number of motors to be fixed upon a car. The author considers, however, that two motors should always be installed, either of which should be sufficiently powerful to take the car home in case the other breaks down. Further, that the starting arrangements should be such, that the two motors are placed in series with a resistance, and with one another at starting, and that under normal working conditions they should be in parallel, series-wound motors, of course, being used.

The question of gear now appears to be reaching finality, but it has passed through many phases. In the early days chain gear was generally adopted with doubtful success. Worm gear followed, but seems now to be gradually giving way before spur gearing.

The tramcars in the author's charge are at present all driven by worm gear. The worms are steel, 4½ pitch, having three parallel threads. The worm wheels are gun metal. The whole is contained in an oil case. The worm is fitted with end thrust ball bearings. Worm gearing, if well fitted, is efficient, but the wear and tear are great, so that it does not long remain in an efficient condition. The worm gear is now being replaced by single reduction gear.

The nature of the controlling gear has an important bearing upon the economic working of a traction system. It has not only an immediate effect upon the revenue account, but affects also the life of the motors and of the generators, not to speak of the comfort of the passengers. Moreover, with good controlling starting gear, the maximum current taken momentarily by the car is considerably reduced, and with many cars working, and therefore many cars starting simultaneously, the amount of generating plant is most appreciably affected.

Within the author's experience, cases have arisen under working conditions of the maximum current being eight times greater than the normal; this, of course, being with crude starting gear. If this maximum were not to exceed the normal by, say, 50 per cent.—and it certainly need not—the necessary amount of generating plant would be very considerably reduced.

As bearing upon the question of the effect of controlling gear upon the life of motors, an incident which happened not very long ago may, perhaps, point a moral. A certain car, fitted with a series resistance and multiple contact switch as starting gear, stood upon a heavy gradient. The engineer in charge ventured to start the car, the immediate effect of which was to burn out a motor armature. On a second occasion, under similar circumstances, he again attempted to start, but this time burnt out the armature of one of the generators. But, not to be beaten, he repeated the operation under somewhat different conditions. The car was now equipped with a series parallel controller—the motors being the same. On this occasion he was successful, as on all subsequent occasions when this experiment was tried.

Cars.—Double-deck cars are almost invariably used in England for urban tramway purposes. The practice, however, on the Continent is just the reverse. With the exception of Paris, single-deck cars seem to be the rule. The correct size of a car and the number of passengers it should carry, are questions which cannot be settled until the conditions of traffic are known. If the line is double throughout a large number of cars can be conveniently worked. If it is a single line, and loops, the workable number of cars becomes limited, and their capacity therefore must be proportioned to the requirements of the traffic.

If the amount of traffic varies within wide limits during certain portions of the day, or at certain seasons of the year, it would appear to the author advisable to attach trailers to the motor cars at those times, rather than to carry a heavy dead load of car weight the whole time.

While on this point, the author would suggest that some better unit of efficient working might be established than the cost per "car mile." What is a car mile? Is it a trailer car carrying 15 passengers and weighing 3 to 4 tons; a motor car carrying 30 passengers, and weighing 7 to 8 tons; or a motor car carrying 80 to 90 passengers and weighing anything up to 23 tons? He would suggest "ton mile" as a better unit.

System of Feed.—The preceding remarks apply with equal force to all methods of electric traction, but the most debatable feature in the question is the means to be adopted of conveying the energy from the generator to the motor.

The trend of technical, as also of public opinion in this country, appears to be in favour of overhead. It is, the author believes, admitted by all that it is the cheapest method; but some have qualms as to its sightliness and safety. These points it is obvious, with a little skill and forethought, can be easily provided for.

Strong posts of ornamental construction are now obtainable, and when used for the joint purpose of lighting the street and supporting the overhead conductor cannot be objected to by the most critical.

The overhead line must always be in evidence, but it is remarkable how accustomed one can become to it, so much so as not even to notice its presence.

The best means of ensuring safety is good work, first-class materials, and sound construction. The gauge of the trolley line should be not less than 000 S.W.G., although 0 (B. & S.) appears to be the general thing on the Continent.

Two overhead conductors should be provided even for single line and loops, being, the author considers, cheaper in the end than spring frogs and other expedients.

Section blocks should not, under any circumstances, be placed in curves, also they should be provided (when trolleys are used) with guard checks to prevent the trolley wheel jumping the line when passing.

The span wire system of support appears best suited to high rates of speed, and is convenient in narrow streets where supports can be attached to the houses, but it necessitates a great number of straining wires at curves which are not sightly.

The life of the overhead line is greatly affected by the class of contact making apparatus which is employed. Certainly, the life appears longer with the rolling wheel than with the sliding bar. Whether the advantage which the bar has at curves and junctions sufficiently compensates for this, the author cannot say.

With a trolley line well erected and fitted with guard checks at cross-overs and junction frogs, there should be little risk of the trolley wheel jumping the line, but nevertheless, such a contingency must be provided for. In the first place, the trolley head, when free from the line, should not be able to rise to any great extent from its working position. In the second place, should it happen that the trolley jumps the line when the car is proceeding at high speed, and the head of the trolley locks against one of the supports (either bracket arm or span wire), something must give way. What will prove to be the weakest link cannot, of course, be given for certainty, but should it happen to be the trolley standard, accidents are likely to occur. The author suggests that it would be best to provide the weakest link in the shape of a loose trolley head, and that this trolley head should be anchored by an insulated cord to the trolley arm, say, 3 feet from the top end. The only result then of the locking of the trolley head would be its dropping free from the arm.

It is necessary, where telephone or telegraph wires crossing the overhead conductor, to provide some means for preventing these wires, in the event of their falling, from making contact with the overhead conductor. There are two ways of doing this: the first is to fix an insulator, such as a wood or other moulding, on the top of the conductor at those points; the second is to suspend above the trolley line one or more guard wires. These latter seem to be preferable, as in practice the wood moulding works loose, and makes considerable noise by vibration when the cars are passing. The guard wires should be stranded and capable of withstanding as great a stress as the trolley line itself. They should, the author also considers, be efficiently connected to earth. If this is so, a telephone wire coming in contact with the overhead line and the guard wire causes a short circuit and a cut-out at the generating station.

With overhead system a rail return is almost invariably used, and, therefore, the question of bonding and of the earth circuit should be considered at this point.

For all practical purposes the conduction from rail to rail by fish plates and bolts must be neglected, and it becomes necessary to provide electrical bonds across these rail joints of the same equivalent area as the rail.

The rails the author is now using have an area equivalent to a square inch of copper. The bonds consequently should have this section. Under these circumstances it is preferable to use two bonds, as one of a square inch section would be inconvenient.

The heads of the bonds should have a contact area of at least 2½ square inches, and should be of such construction as not to render them liable to work slack. It is a good thing, in calculating the fall of potential upon a given line, to allow 20 per cent. for increased resistance due to the slackening of the bonds. Even with this bonding, unless the disposition of the gas and water mains has been carefully considered, the Board of Trade limit of stray earth current is likely to be exceeded.

If a gas or water main crosses the track or approaches the vicinity thereof, and from that point takes a shorter route to the neighbourhood of the station earth than do the tramway rails, or has along that line of route a less resistance than the corresponding tramway return, it will take a greater proportion of the current than is allowable; then, parallel to that gas or water main, an insulated conductor should be laid from the point of the tramway rails above mentioned to the negative terminal of the dynamo.

Conduit.—The local conditions necessary for the successful working of a conduit system are, the author considers, freedom from sand and mud on the roads, good drainage, and a wide slot. The conductor should not be visible from the surface of the street, and should be frequently supported on insulators. It is necessary to have a wide groove in order to obtain an efficient form of collector or plough, as not only has it to contain the insulated conductors, but it must also be mechanically strong. The groove of the conduit should in all cases be parallel to the lines, and the conductor should not be continued across the points or cross-overs, as in these cases it would necessarily be exposed.

Generally, conduits contain two insulated conductors, and this, to the author, seems preferable. It cannot be said that conduit systems have, up the present, been successful enough to warrant their general adoption. Recently, the author inspected four different conduit systems, but only two of these were then working.

The initial cost of a conduit system varies from 30 to 200 per cent. in excess of the cost of an overhead system, and the up-keep, even where the conditions are favourable, is about 10 per cent. greater than with the overhead.

Accumulators.—The accumulator system of traction certainly possesses very great advantages, the principal of which is that the service of cars is not dependent on the maintenance of one system of feed, each car being entirely independent; but we have carefully to consider at what cost this independence is obtained. The crux of the whole question is the cost of carrying a useful load of passengers a certain distance, and for this purpose it is as well to see how the question is affected by the adoption of storage cells. There are three heads under which additional expenditure is entailed; first, the interest upon the additional capital required for the installation of the cells, and also their depreciation; second, the cost of propelling the additional dead load; third, the inefficiency of the cells.

With cars running all day with one charge, the weight and cost of cells are both very great as a comparison of the cars used in Dresden for overhead line only, and of the cars at Charlottenburg for accumulators, will testify. Dresden cars, carrying 40 passengers, weigh 8 tons; Charlottenburg cars, carrying 42 passengers, weigh 23 tons. In both cases the useful load of passengers is approximately 3 tons. The cost of the accumulators used on the latter cars is about £750 per car.

The cost of traction accumulators varies from £75 to £125 per ton, the former figure being for rapid charging and discharging short-distance cells.

The author was much interested in the statements made by Mr. Epstein in his Institution paper (on the authority, he believes, of the Hanover Tramway Company) that the cost of the accumulator system of working there was only ·2d. per car mile greater than the overhead system, and he must confess, when making his recent visit to Hanover, he did so with the intention of ascertaining how that ·2d. was arrived at. To a certain extent he was unsuccessful, the cost of the up-keep of the cells not being obtainable; but he believes that the figures which he has obtained are sufficient to effectually disprove that statement.

There is in Hanover one line of rather less than 10 miles worked entirely by accumulators, the cars working that line being also equipped for the overhead, so that they are interchangeable with cars working on the combined system. They weigh 11½ tons, and carry 36 passengers. The time occupied in running this journey, exclusive of charging and stoppages, is 45 minutes. The cells are charged at two stations *en route*, at one of which eight minutes charge is given at constant potential, and at the other 25 minutes. The accumulators are placed under the seats, each car being fitted with 208 cells of Tudor type, and there are three plates in each cell. The weight of these cells is approximately 2 tons, and the installation cost of each car £200. *The energy taken per car mile on this track was* 1·5 *units.*

Although the up-keep cost of the cells was not obtainable, the average life of the cells was given at about 18 months, and, moreover, additional cars have to be provided on the accumulator line, as several cars are always occupied charging.

There is also another line at Hanover worked on the overhead system. Here the cars carry 32 passengers, and weigh 6 tons. *The energy taken per car mile of these latter cars was* ·68 *units.*

On the *combined overhead and accumulator* system, with cars similar to those in use on the accumulator line, the *energy taken per car mile was* 1·37 *units.*

Leaving the initial cost of the accumulators out of the question, there is the effect on the revenue account to be considered.

With rapid charging low capacity cells (which are really the only ones worth considering), the weight of cells for a five miles' journey with one charge is about 1 ton for every 3¼ tons of car and passengers. Therefore, with a car and passenger load of 13 tons, we must have 4 tons of accumulators. As every ton mile on a given road requires the same expenditure of energy, it follows that the energy given to the motors to propel this car will have to be increased approximately 30 per cent.

Opinions differ as to the efficiency of these cells, but generally the users of them consider that the watt-hour efficiency is about 60 per cent., and the author does not think the figure is far wrong. Therefore, the energy of charging these car-carried cells has to be increased 117 per cent., owing to their inefficiency and weight. Further, the wear and tear of the road and cars is increased by the additional weight.

The life of the plates of the cells is variously given by the users as from one to two years, by the representatives of the makers as from two to three years; but the majority of the users do not find much difference between the life of positive and negative plates. The cost of the up-keep of cells is given by the various tramway companies using them, at from ¾d. to 3½d. per car mile, and the author thinks a fair average may be taken at 1½d. Assuming the cost of current to be ·75d. per unit, and ·7 of a unit to be taken without cells, figures the author does not think advocates of accumulators will cavil at, the cost of energy with the overhead system would amount to ·325d., and with accumulators to 1·14d., or an additional cost of ·62d.

This added to 1½d. for the up-keep of the cells per car mile, gives us the additional cost of 2·12d., neglecting the extra wear and tear of the cars and road.

Now consider the capital cost. The overhead system per mile of double track costs complete, including bonding of the rails, steel posts (on span wire or bracket system) about £1,600. If these posts are used for street lighting purposes, the cost of the posts should be divided equally under the two heads, reducing the overhead cost to £1,000 per mile of double track, with a 2½ minutes' service, and cars travelling eight miles per hour there will be six cars on the mile section, and, with the weight of the accumulators given, each car would cost £300 to equip, or £1,800 per mile of double track.

Again, if charging stations were adopted with, say, 15 minutes' charge, six additional cars would be required at an additional cost per mile of £560, making altogether a sum of £2,360 per mile.

With a slow service of cars the initial cost of the accumulators would probably be less than the overhead, but the additional cost of 2·12d. per car mile (with only 20,000 miles per car per annum) capitalised is equivalent to the sum of £3,530, bearing 5 per cent. interest for each car running.

Combined Systems.—Various combinations of the three systems before enumerated, have been adopted. More generally, it is a combination of the overhead line and accumulator system, but in all cases of which the author has cognisance, the adoption of accumulator systems has been not a matter of choice but of necessity.

When the necessity arises, the author would desire to point out most strongly that the dead load of the cars in proportion to its useful load, should be as small as is compatible with stability of structure. That arrangements should be made that the additional dead load of the accumulators is carried only so far as is absolutely necessary. It is therefore advisable to so arrange the battery that it can be detached as a whole from the car at the junction from the overhead line.

A great deal has been said from time to time as to the effect of the acid upon the cars and trucks, and of the odour of sulphuric acid which pervades the cars when the cells are placed under the seats. From what the author has seen of modern systems constructed on these lines, he can give his assurance that these complaints are not well founded; and, if it were not for the inconvenience of detaching the battery as a whole from the car under these circumstances, he would certainly recommend the cells being placed beneath the seats.

Where the conditions are such as would permit of the working of a conduit system, and in the absence of permission to use the overhead, the author considers the combination of overhead and conduit much more preferable than the use of accumulators. The additional weight carried is negligible and the working cost decidedly lower than with accumulators.

There have been many attempts to devise improved methods of electric traction, to obviate the disadvantages of the systems above remunerated, but they, one and all, have drawbacks peculiarly their own, which have hitherto prevented their general adoption. The names of these systems are legion.

The conclusions arrived at by the author all tend to the opinion that in the present state of electric traction engineering there is but one good and reliable and cheap system, and that is the overhead. Where a combination is necessary and conditions are favourable, overhead and conduit combined comes next in order of merit. That as at present constructed accumulators are not, from a commercial point of view, a satisfactory solution of the traction problem.

ELECTRIC TRACTION.

By J. E. Stewart, Borough Electrical Engineer, Derby.

The paper I venture to lay before this Association will, I fear, be disappointing to my engineering brethren, as it will more concern the chairman of committees, and gentlemen who have the responsibility of leading the policy to be pursued by corporations, and of voting the necessary funds for the purpose of carrying out such schemes, and what I have to say is with a view of promoting discussion, and to obtain the advice of these gentlemen so that other or all towns may see for themselves what is the best policy to be pursued with regard to street railways or tramways that this Association can recommend. I do not wish it to be understood that I necessarily recommend or advise upon any of the points I lay before you, but do so solely with a view of gaining myself the knowledge of what you consider the best course to follow.

There are several towns which are now considering the question as to the advisability of buying up the existing horse tramlines, and are wondering what is to be done with them if they become corporate property, and some are trying to arrive at that stage when they are prepared to vote for an electrical equipment, and then, further on, what scheme of electrical traction shall be adopted; after that, whether a separate power house shall be laid down, or the current taken from their existing plant in the electricity supply works.

Starting with the assumption that the electricity supply works is now in the hands of the corporation, and that the tramways are also the property of the corporation, and that it has been decided to equip the same with electric motor cars.

The first consideration is, shall the current be supplied from the existing works?

This, I believe, should be answered in the affirmative, for the sufficient reasons that the same buildings, boiler, power and plant, will answer the purpose, and the necessary spare plant will not be augmented, but, on the contrary, considerably reduced in proportion to the output, as accumulators would be introduced to, as far as possible, reduce the necessity of adding plant to take the load over the lines, when the maximum load for the ordinary supply occurs at the same time as the traction load.

Secondly, the cost of keeping accounts will be very much reduced, as the work that is necessary to keep the electricity works accounts will not be added to as would be the case when a separate power house is laid down.

The power used would be metered as for an ordinary consumer, and charged for as such.

The interest and sinking fund on the capital outlay on buildings will not be increased, or only slightly so, which would not be the case if a separate power house were decided upon.

The same staff of men would practically do, or, in any case, with a small increase only necessary.

The same engineer would, in consequence, control the whole supply, and would, of course, be handsomely recompensed for the added responsibility. I recommend Glasgow Corporation as a pattern to all our esteemed chairmen of committees. These have raised the engineer's salary to begin with.

Having decided so far, that the one works should do all the work necessary to supply electrical energy for whatever purpose it may be required, it cannot too carefully be considered as to what arrangements should be made to save confusion and friction between committees or the various departments into which the work of corporations is divided.

The committee, I think, should be composed of a definite number of gentlemen, which should be divided into two sub-committees. One to be responsible for the supply of electricity, arranging of prices and managing the supply works. The second to be responsible for the tramway's equipment and management, and each should report its recommendation to the ordinary committee meetings. The necessity for this, or some similar method of working, is as follows:—

Where tramways are laid down certain mains will have to be laid; at the same time arrangements could and should be made, where they have not already been made, for laying mains or ducts for the purpose of supplying current to the ordinary consumers along the line of route, and the apportionment of the work would be made by the committee as to how the capital charges should be allotted, and incidentally save the cost of opening the streets a second time.

All the posts, where any are used, should be arranged for the purpose of the electric lighting of the streets, and the charges treated in the same manner as before.

These considerations are reasons also why the engineer of the one concern should also be the engineer of the other.

This arrangement of committees would save any troubles as to difference of opinion as to the charges that are too likely to occur, when one committee is or may be trying to force the hands of another committee. At the same time, each sub-committee would be powerful enough to have the charges reconsidered at any time that was considered necessary, and also they would have all the information at their hands to come to a fair conclusion in the matter.

The charges of supplying service mains to the tramway premises should be borne by the electric supply works, and the current meters there and the feeders for the tramway system should be, of course, a charge against the tramway concern.

It will be apparent by this arrangement that the tramways will be in a far better position to pay its way than if it had to supply all the necessary buildings, plant and staff to run a system of its own, and the electricity works would be in a far better position to turn out energy at a cheap rate if its machinery is working all day at a full, or considerably increased rate of output, and consequently this would mean reduced charges for current all round.

The town will be the richer in every way from this arrangement.

Where the electric supply works are the property of a company, it is much to be desired that the whole supply should be controlled from the same works, as, in the course of time, most of these works will undoubtedly become the property of the corporation, but the price per unit must be arranged, and the supply given to the corporation with safe guards, in this direction; that the corporation shall not be called upon to pay (should they desire to purchase before the license expires) more for the machinery and plant used than that which it originally cost, less the sinking fund paid on same, and that the company's capital shall be valued less the profit made upon the supply to the corporation; that is, supposing the corporation supply increased the dividend of the company by 1 per cent., this would naturally enhance the value of the shares in the market, and the corporation without the safeguard would be required to find this amount should they determine to purchase before the license expires. There are difficulties in this arrangement, but it would be idle to say that they cannot be overcome. The difficulties will chiefly be those of apportionment of the cost of generating the current for the tramway supply, and of the apportionment of the profit made on this supply.

Conduit Systems.

The opinions expressed almost universally is that they are, for various reasons, undesirable, more especially where an ordinary system of horse traction is now laid down, as the cost of the conversion is so great, that it practically makes it impossible to make any adequate return upon the capital outlay; perhaps with the exception of where the traffic is so great, that there is practically a continuous stream of cars passing, but it certainly would be out of the question in outlying districts.

The enormous disturbance necessary to the streets is also a very serious matter, and the dislocation of the traffic during the course of the works, leaving out altogether the question of the cost.

Drainage is also a difficult matter, the cleaning of the conduit a constant source of expense.

Children's hoops and such like matter getting into the conduit are causes that make for damage to the collectors and stoppage of the cars.

Cushion tyre and solid tyred bicycles would be wrecked and personal damage done to the riders, not to speak of the modern narrow tyred carriage wheel.

Accumulator System of Traction.

The great advantages of this system are, that any car is self-contained—the speed can be varied considerably—not necessarily necessitating any disturbance of the existing road—although I fear there are few roads in the country that it would be economised, or upon which it would be safe to run accumulator cars without relaying the rails for these reasons:—

The great weight of the cars, and also the necessity of much stouter rails when vehicles are self-propelled—this is common to any sort of electric traction of course—but more so with accumulator cars, owing, as before said, to the great weight of the cars; and also, the average tramway groove is not deep enough for self-propelled traffic.

The disadvantages are:—

Great weight—about 30 per cent. of the total weight being taken up in the weight of the accumulators—which have to be carried whether the cars is carrying one passenger or is fully loaded.

The fact that it is practically impossible with our present experience to work satisfactorily on hilly roads, and the inability of attaching trailing cars—owing to the rapid deterioration of the accumulators.

The necessity of having to take the cars off the road for the purpose of having another set of cells put on board the car.

Smell of acid which will certainly get into the car, and it is very objectionable—it having the tendency of causing sneezing and consequent large absorption of whiskey to keep off the influenza which people are inclined to believe they have caught in consequence.

Rapid deterioration of the plates, and consequent heavy cost to keep up. This item alone is the principal cause of the want of success.

The course of construction is somewhat on a par with the overhead system, varying with the number of cars run per hour.

System depending upon automatic devices for the purpose of making contact at stated places as the car passes over, or on which one has to rely for the purpose of making the disconnection, are, for obvious reasons, out of the question—even if the only reason was the great number of such automatic devices necessary, and the likelihood or possibility at any time of one not acting properly, thereby causing a pressure of 500 volts to be exposed on the road for all and sundry to come in contact with.

The Overhead System.

This system is by far the most economical to work, and the up-keep is also the lowest.

The greatest argument in its favour being that, with this system, it can readily be charged to accommodate itself to any great or small improvement that may be made from time to time in the system of electric traction in the future, with the least waste of installed plant. But I anticipate that these improvements are only likely to be made in details.

The maximum degree of flexibility is obtained by this system also.

Trailing cars can be added and the average speed kept up. This also applies to the conduit system.

And perhaps the strongest reason for adopting this system is that every town which has sent deputations around to gather information has reported in its favour, and that it is found cheaper to work, completely under control, and that the overhead equipment is not considered or found to be an eyesore in the towns where it has been properly installed.

The argument that the overhead line is in the way of fire escapes is got over by the fact that most modern escapes are made for transport in a horizontal position, and a pair of pliers and rubber gloves is a simple way of overcoming the difficulty if the fire occurs on the route of the line, and it becomes necessary to stop the service before the engine and staff can arrive to switch of at the stated section.

Additional Reasons why Mechanical Traction should be Adopted.

Three electric cars can carry as many passengers and travel the same mileage as four horse cars, with a consequent saving of the wages of one driver and conductor; or, putting it another way, with the same number of cars costing the same for drivers' wages and conductors' also, 30 per cent. more miles can be run with quite 30 per cent. more customers, as, what has been proved in every case with both railways and street traction is, that the faster and greater the service the faster the receipts go up.

A Few Considerations why Local Authorities should have the Control of the Tramway System.

Firstly, all streets and work carried out under or upon them should be under the local authority. It is common knowledge and experience that, whenever a street has been carefully laid and repaired, there the gas company, &c., come along and begin cutting it about; whereas, if the whole of the matters concerning the streets and what is below was under the corporation control, these matters could in 50 or 60 times out of 100 be done just before, or whilst the repairs were under way, thereby saving great expense, and criticism from the ratepayers.

The whole of the inhabitants are directly interested in rapid transit, therefore, it is to the town's advantage to own the tramways.

Also, it is much better to raise revenue by indirect taxation than by rates; therefore, all towns should get as much control of such means of obtaining revenue as possible. We all feel some compunction in the paying of rates, but none of us object to pay a price for an article, or a service done for us, a part of which goes towards paying rates or reducing the existing rates.

When to Purchase.—Given that a local authority has decided to take over the street system, and to equip it with an electric system of traction; I believe it would pay any corporation to obtain control of the system at the earliest possible date after having once made up their minds to do so, and this time I believe might, with advantage, be about three years before the license lapses, for one very strong reason; it would prevent the tramway company from laying rails during that period which would not be serviceable for electric cars. And it would also prevent the liability of the corporation being placed in the position of having to find the cost that a company could, if they so desired, make a corporation pay by relaying, during the last year or two, the whole system of rails, and those rails not suitable for the purpose of power traction; and thereby making the purchase as expensive as possible with a view of choking them off.

If this course, viz., the purchase was made at the earliest date possible, the corporation, of course, would have to pay, as part of the purchase, the dividends that might or would be paid during the number of years that still remained before the license expired, also the directors' fees, and should the manager, &c., or other officials be dismissed in consequence, it would only be fair to compensate them also; but with all this, it would be much cheaper in the end to purchase upon these terms, than necessarily leave the purchase until the last minute.

The following figures are taken from three small works and three large ones.

The small works generate the increased number of units generated, at the average cost of 1·043d. per unit.

Adding a proportion of the charges for interest and sinking fund, brings the cost up to 1·243d. per unit.

Works.	1895. Units sold.	1895. Total costs.	1895. Per unit.	1896. Units sold.	1896. Total costs.	1896. Per unit.	Increase units sold during the year.	Cost of generating the added units.	Cost of added load per unit.	Cost per unit for interest and sinking fund.	Total costs interest and sinking fund per added unit generated.	Charge per units tramway section.
Edinburgh	888,335	£6,181·33	1 67	1.721,557	£8,105 66	1·13	833,238	£1,924·33	55	·2		
Manchester	1 748,244	£13.111·83	1 80	2,508.588	£15,156 05	1·45	760,344	£2,044 22	64	2		
Westminster	2,830,396	£27,242 55	2·31	3,503,054	£30,505·76	2·09	672,658	£3.263·21	1·16	·2		
								Average	783	·2	·983	1·983d.
Nottingham	171 654	£1,995	...	297,185	£2,687	...	115,531	£692	1·43	·2		
Huddersfield	227.753	£2,723	...	304,163	£3,003	...	76,410	£280	·88	·2		
Portsmouth	406,118	£3,486	...	839,392	£5.980	...	433,174	£1,494	·82			
									3 13	·2	1·243	2 243
									1 043			

Therefore it is shown that these works could afford to sell that number of units at 1 74d. per unit, and make a handsome profit of ½d. per unit on the transaction.

And the larger works show as to what the costs are likely to fall to, with the growth of electricity supply works.

The total works' costs for the increased number of units generated is shown to average ·783d. per unit, and with the added allowance for interest and sinking fund on the capital outlay of ·932d. per unit, showing that these works could afford to supply electricity at 1·483d. per unit, at a profit of ½d. per unit as before. The interest on the capital is calculated at 3 per cent., and the sinking fund at 3 per cent. also; therefore, above the ½d. per unit profit shown, an allowance of 6 per cent. is paid already on the capital outlay.

REPORT OF THE CAPE OF GOOD HOPE GOVERNMENT ELECTRICIAN AND INSPECTOR FOR THE YEAR 1897.

Treasury, Cape Town,
Cape of Good Hope,
March 14th, 1898.

REPORT OF THE GOVERNMENT ELECTRICIAN AND INSPECTOR FOR THE YEAR 1 97.

The As is'ant Treasurer.

(1) *Work done under the Appointment.*

Sir,—Application has been made for statutory powers for electrical supply. Such powers are granted in England in the form of a provisional order of the Board of Trade, such procedure being less expensive than that of a private Bill, and securing uniformity in the conditions of concession and liabilities. A model order, following the form of provisional order of the Board of Trade, has been drafted, but, as the matters dealt within it are for the most part beyond the limits of the Electric Lighting and Power Act, 1895, which relates almost exclusively to securing the safety of the public and the protection of telegraphs, consideration has been given to the necessity for and the terms of further legislation on this subject.

No new mains for electric supply have been laid in Cape Town, and only a few extensions have been made in the suburbs of Cape Town, owing to the fully loaded condition of the generating plant in each case.

The remarks in my Report for 1896 upon the unsatisfactory condition of the electric supply system in Cape Town, and the absence of systematic testing, appear to have been justified by the occurrence of several fires which have been attributed to defective wiring. These defects having been on private property, cannot be dealt with by the Government, but the matter having been referred to me, I have pointed out that the fire insurance companies have in their own hands a remedy which is most satisfactorily applied in Europe and in America, namely, the enforcement of regulations for proper insulation and workmanship.

The Government Electrical Laboratory, which has been so well and liberally accommodated for nearly two years at the South African College, has been removed to a room in the General Post Office.

The system of electrical measurements by potentiometer has proved to be suitable for the purpose of this Laboratory, and the standard cells which are relied upon in this system have been compared together once a week, and have been found to agree well together.

A number of voltmeters and amperemeters have been sent to the Laboratory by the Cape Government railways and from the Royal Observatory for comparison with the Government standards, and a voltmeter and an amperemeter belonging to the Town Council of Cape Town were tested at their works, the current, 400 amperes, being more than could be obtained at the Laboratory. Only one supply meter has been sent in for examination. A recording voltmeter for the Tramway Company has been tested, and testing instruments have been lent to the General Post Office and to the Cape Town and Suburban Electric Light Company.

I have been further indebted for voluntary assistance in the Laboratory to Mr. W. H. Logeman.

The electric tramway in the southern suburbs of Cape Town, from Rosebank to the Liesbeek Bridge, was inspected on June 3rd. The Port Elizabeth Electric Tramway, from the corner of Walmer Street and Union Street to the corner of Prince Alfred's Park, was inspected on June 14th; and on July 19th the hill sections of the Port Elizabeth tramways were inspected, and careful tests were made of the brakes on the unusually steep gradients, under various conditions of speed and wetness of the rails. These tests gave very satisfactory results, and the plant and equipment of the Port Elizabeth Tramways is in general well designed and constructed. On August 17th the Cape Town Suburban Tramway from the Liesbeek Bridge to the Crown Hotel, Claremont, was inspected, and all these sections of tramways, after certain alterations, were opened for public traffic.

After the Cape Town Suburban Tramway to Claremont had been at work for a few weeks, tests showed that the electric pressure causing leakage of electric current in the ground between the tramway works and the end of the rails, largely exceeds the limit permitted by the regulations. Calculation showed that at this rate the pressure between the Wynberg terminus of the line and the works would be about 6½ times the limit permitted by the regulations. After being called upon to comply with the regulations, the tramway company somewhat reduced this pressure by replacing certain defective work which had been destroyed by electrical corrosion underground.

The remainder of the line as far as the terminus at Wynberg was inspected on December 28th, and a test of the pressure was made between the works and Station Road, Wynberg. The pressure was found to considerably exceed the limit permitted by the regulations, and the leakage, which has seriously disturbed, and in some cases has suspended, the telegraphic service, is corroding the water-pipes underground. The line was conditionally opened for public traffic in order to afford the tramway company time for taking steps to remedy this defect.

Several accidents, including an outbreak of fire, have been caused by the fall of the telephone wires across the trolley wire. The tramway company have not hitherto been called upon to protect, in accordance with the Regulations, wires which cross the road in groups of less than six, but this exemption has now been withdrawn.

Other tramway accidents, one having a fatal result, have occurred, but not being of an electrical nature, they have not come officially under my notice.

(2) *Work other than under the Appointment*

On my visit to Port Elizabeth in June I inspected the telephone lines with the view of re-arrangement with regard to the tramways, and to the site of the new Post Office.

In July I inspected and reported to the Department of Public Works upon the generating plant for electric supply in the General Post Office at Cape Town, and on the electric lifts in that building, so far as related to their conformity with the specification.

Alterations in the electric lighting of the Assembly Chamber and of the Council Chamber of the Houses of Parliament, and schemes for electric lighting of the Valkenberg Asylum and on Robben Island, have been referred to and reported on by me.

The Municipal Councils of Queenstown, Worcester, and Cradock have applied to me for advice on general electric supply, and on the utilisation of water-power for this purpose, and tenders for the supply of machinery have been submitted to me. I have reported that since no specifications had been prepared the tenders were not satisfactory; they were not sufficiently explicit; could not be compared, and none should be accepted. I recommended that a consulting engineer should be employed to act for these Councils.

The Municipal Council of Woodstock asked my advice as to the lighting of 120 street lamps. I reported that the running of a special electric lighting plant for such a purpose would be more expensive than gas lighting. I gave some information on a general electric supply for the district, and estimated the working expenses at about 7½d. per unit, exclusive of interest and depreciation.

Owing to numerous accidents by electric shocks from the tramway in Cape Town, the question of providing means to enable the police to give aid was discussed, and I drew up a set of instructions to the police.

I have been applied to for, and have given advice on, the equipment of a physical laboratory for the Huguenot College at Wellington.

In the Government Electrical Laboratory I have made comparative tests of the illuminating power of certain brands of paraffin oil, and I have, at the request of the Government Marine Biologist, constructed and experimented with an electrical thermometer for observing the temperature of the sea at different depths.

(Signed) A. P. Trotter,
Government Electrician and Inspector.

APPENDIX.

Government Notice.—No. 873, 1897.

Treasury, Cape Town,
September 13th, 1897.

The following instructions to the police with regard to their action in the event of electrical accidents are published for general information.

By order,
H. M. H. Orpen,
Assistant Treasurer.

Treasury, Cape Town,
Cape of Good Hope,
September 13th, 1897.

Electrical Accidents.

Instructions to the Police.

If a wire falls in a street in which the electric tramway runs, and the end hangs loose, or lies on the ground, the best thing to do is to *leave it alone* until one of the tramway company's staff comes. In such a case the best thing that a constable can do is to prevent anybody from touching the wire.

If a wire, as it lies on the street, is an obstruction to the traffic, it may be pulled on one side by means of a stick, a walking-stick with a hooked handle would do well, or it may be moved by using rubber gloves. It would be better to allow the traffic to be impeded than that the constable should leave the wire in order to get the gloves from the nearest station.

The thick wires which run above the middle of the street are called trolley wires. They convey the current to the cars. Smaller wires, called span wires, are stretched across the streets to support the trolley wire. Other small wires are erected in some streets for the purpose of preventing telephone wires from falling on the trolley wire. If a telephone wire falls and is kept by the guard wires from touching the trolley wire, or if it touches a span wire, and does not touch the trolley wire, no shock can be given by it. If the loose end is an obstruction to traffic, and if it can be drawn away and tied up without any risk of touching the trolley wire while doing so, this may be done. Rubber gloves should be used. If there is any risk of touching the trolley wire with the wire which is to be handled, it is better to *leave it alone*, and to see that nobody else touches it until a tramway man comes.

If a wire falls across a trolley wire, or the trolley wire itself touches the tramway rails, there will be a violent flash. When this flash occurs, an automatic switch at the tramway works will be opened, and the electric supply will be cut off on the section on which the accident has happened. The trolley wire is divided into sections of half a mile in length. As long as the switch is open, no tramcar can run on that section, and the wires are harmless. As soon as the attendant at the works sees the automatic switch fall open he will try to close it, in case the cause has been a momentary one. If, however, the wire still lies touching the rails, he will be unable to keep the switch closed. The same thing may happen if a wire falling on the trolley wire touches a tramway pole, electric lighting pole, telegraph pole, or other metal work connected with the ground; but this is not certain.

It is very undesirable to make a connection between a wire and the tramway rails or any other metal work intentionally, because the flash which will occur will be so brilliant that it will unnecessarily alarm the bystanders, and may so dazzle the constable who causes it to touch that he may be unable to see anything for a minute or so.

It is a good thing to keep the wire on the rail if it touches at all. It may be held there with a stick, but it is advisable not to hold it there by standing on it, since, if the rail is dirty, a slight shock, but enough to cause the person standing to fall, might result.

If the end of a wire hangs loose in the street, and is an obstruction to traffic, a rope or piece of strong string may be put round it with a "half hitch," without touching the wire with the hands, and it may then be drawn on one side. Great care must be taken in doing so, that it touches no other wire, pole, or metal work.

The electric pressure (500 to 570 volts) used by the tramway is not sufficient to give a fatal shock to a human being. It is sufficient to produce serious burns. The pressure used for electric lighting in Cape Town is 220 volts between any wire and the earth. The highest pressure between any wires accessible to the public is 440 volts; 220 volts would probably kill a horse. A pressure of 2,250 volts is used in Rondebosch and in the neighbouring districts, but the wires are not accessible to the public. The pressure on the service wires is about 100 volts.

If a wire falls on a person and winds round him, or becomes entangled in the clothing, the wire should be pulled away with a stick, or by wrapping the hand in a dry coat, or by means of rubber gloves, taking special care that the wire does not touch the skin either of the victim or of the rescuer.

A severe electric shock may produce sudden stoppage of the respiratory and heart muscles. If the stoppage of the heart's action is complete, it is doubtful if anything can be done; but in some cases the stoppage is not complete, and animation is only suspended. The condition is similar to that of apparent death by drowning, and the well-known method of producing artificial respiration should be resorted to without delay.

Summary.

If a wire falls harmlessly, leave it alone, and prevent anyone from touching it.

Only the trolley wire, or the wire touching it, does mischief.

The electric current is, as it were, always trying to pass from the trolley wire direct to the tramway rails, or through the earth to the rails.

A shock can only be felt when the body forms part of a path by which the current can pass from the trolley wire to the rails.

The electric current cannot pass through *dry* wood, cloth or rope.

(Signed) A. P. Trotter.
The Government Electrician and Inspector.

THE TELEPHONE INQUIRY.

(*Continued from page 864.*)

The Select Committee on Telephones sat again on Thursday, Mr. Hanbury presiding.

Sir James Ferguson said he was Postmaster-General from December, 1891, to August, 1892, and he joined the board of the National Telephone Company in 1896. Before he visited the Post Office on his appointment, he had an interview with the Chancellor of the Exchequer, when the Chancellor mentioned a matter of great difficulty in the Post Office, viz., the management of the telephones. Mr. Goschen pointed out that the telegraph revenue had been apparently injured by the operation of the telephones, and it was thought necessary to do something to put the matter on a better footing. The Post Office felt that the only proper course to pursue was for the Post Office to purchase the telephones, but the Treasury decided not to do that. He said he would endeavour to fall in with the policy of the Government, and very soon after he went to the Post Office he set the department to work to frame a scheme. He suggested that they should find out the Government's policy and the company's policy, and see how far they could be reconciled. The result was, that a scheme was submitted to the Treasury embodied in a Treasury Minute. A Bill was introduced by himself for the purpose of taking more powers by the Post Office, and to some extent the Telephone Company. That Bill was referred to a Select Committee, and, incidentally, the whole scheme of the Government was explained in detail. The Committee reported on the motion of Mr. Shaw-Lefevre, in favour of the Bill, but recommended that the terms of the licenses should not be extended. With that reservation, the Committee thought the responsibility of the agreement with the company should lay with the Government, but that the details should be laid before Parliament. That was the report of June 16th, 1892.

The Chairman: The reservation being that these licenses should not extend beyond 1911?—Yes; the chairmen of the companies urged that the licenses should be extended to enable the companies to recoup their capitals.

Continuing, Witness said the reservation referred undoubtedly to the existing licenses. Moreover, there was so strong an assumption that the telephones would revert to the State in 1911 that the question of new licenses did not arise. The Bill passed both Houses with hardly any discussion. Still, the agreement with the company hung fire through the indisposition of the company to accept it, and their desire to get some better terms. As the Committee was aware, it was not until just before the Government quitted office that the agreement was initialed by himself and by the chairman of the company. Those heads of agreement had the full concurrence of the Chancellor of the Exchequer. They were studied with the greatest care by the Chancellor who went over them line by line, and he personally conducted negotiations with the chairman of the Telephone Company. He believed that the Chancellor had four meetings with Mr. Forbes, and he never knew a gentleman more closely cross-examined in his life. Only a few days ago Mr. Goschen informed him that he was responsible for every line in the agreement. He mentioned that because it seemed to be thought that the signing of the agreement before the Government left office was a hasty decision. That was plainly disproved before in the House of Commons on March 22nd, 1892, he stated in the plainest terms, the whole purport of the agreement. The two telephone companies who had absorbed all the others, introduced private Bills in order to obtain increased power for carrying on their business, because they were so restricted by the terms of their license that the system was greatly hampered. He opposed the second reading of the first of those Bills, viz., that of the New Telephone Company, and pointed out all that had been done.

The Chairman: All we want to know is how the heads of the agreement with the company were signed on the very evening that the Government was defeated. We have the facts that the heads of the agreement were well known to the Chancellor of the Exchequer representing the Government, as well as to yourself, and had his full concurrence. Now they were signed on the day on which the Government was defeated. Were they so signed with the knowledge of the Chancellor of the Exchequer?—Certainly. I must point this out that my honour is at stake in this matter. I submit to the Committee that it has been suggested here in many questions that this agreement was hastily entered into on the eve of the Government leaving office. I am concerned to point out to the Committee that the full terms then initialed were stated to Parliament repeatedly, not only on this occasion but before the Select Committee, and explained with the greatest detail without reserve. That is most important in view of the suggestions which have been made. I observe that at the last meeting of the Committee it was suggested that I had entered into an understanding with the chairman of the company before he signed the agreement, which was not contained in the Treasury Minute, and which I think it was stated was a secret understanding.

That was so stated?—Then it is an utter misapprehension.

In the first place the heads of agreement were signed with the consent of the Chancellor of the Exchequer and with his knowledge?—Certainly.

Was it a fact that the chairman of one of the companies objected to sign that agreement?—He was very reluctant to sign it, as he had been all along, and he only eventually signed it on my assuring him that it was the intention of the Post Office to carry out the granting of areas in a reasonable manner.

Did he act for both companies?—No; I think the Duke of Marlborough came in afterwards. I am pretty sure of that.

Was your assurance given to both companies, or only to Mr. Forbes, the chairman of the National Company?—As far as my memory serves me, I only remember giving it to Mr. Forbes.

Therefore, whatever the effect of that assurance, it can only refer to the agreement signed by the National Company? -It was not any new assurance. It was only a repetition of what had been stated before the Telegraph Bill Committee.

The heads of agreement were signed subsequent to this report?—Certainly.

If the agreement was to carry out all that had been arranged or said before the Committee, why was this promise, instead of being a verbal one, not put into the agreement?—The answer is that it was clearly understood that these areas are subject to further arrangement.

That is in the agreement. It was with these words that Mr Forbes found so much objection, that he would not sign until he had got a verbal promise?—Yes. I said to Mr. Forbes: "Certainly, the Post Office will carry it out in a reasonable manner," and my successors have done so.

The Chairman, to Mr. Lamb: That is what you said?

Mr. Lamb: That was my evidence before the Committee.

The Chairman, to Sir James Ferguson: Who was present when the agreement was signed?—I should think probably Sir Arthur Blackwood and Mr. Lamb.

Was any record made of it?—I cannot tell you.

I tell you frankly why I ask all these questions. It is simply this: the Post Office have very largely extended the areas which were conceded to the company under the agreement, and I gathered from Mr. Lamb that the Post Office rather took the view that in consequence of your promise the Post Office were under some obligation at the request of the company to enlarge these areas. The agreement does not say so?—Second-hand evidence is not worth much, but I used from time to time to ask Mr. Arnold Morley how the agreement got on, and he said that the settling of the areas was a very difficult affair, and took a long time. I had a relative on the directorate of the company, and he told me the same thing. I assure the Committee that the view I took, and the view I always understood was taken, was that it was a great convenience to the public that the areas should be extended.

That may be so, but these areas have been extended by the Post Office since these questions regarding the Telephone Company reached an acute stage, and unless there was some strong reason binding the Post Office to so extend the areas during this critical period, some members of the Committee might think that the Post Office should have held its hand. The agreement, as it stands, undoubtedly does not require the Post Office to do anything of the sort, but Mr. Lamb certainly seemed to think that your promise had rather forced the hands of the Post Office?—I never heard it suggested until Tuesday, and I believe that what I said to Mr. Forbes was simply in conformity to what was said before the Committee.

Did it go in any way beyond what was known in the agreement to the public?—Not in my opinion in the spirit of it, but certainly it did as to the letter of it. Mr. Forbes said he did not think it was plain, and I said he might be quite sure that the Post Office would come to reasonable terms about the areas.

Did anything you said to Mr. Forbes in any way bind the Postmaster-General, or qualify his discretion, or really convert the word "may" in this agreement into "shall"?—I can only repeat what I understood all along, that we were going to make reasonable terms about the extension of areas, and I assured him of that.

Further questioned by the Chairman, Witness said that no record was made of the promise. The Post Office knew what had been done, and if they pointed it out to his successors he considered they would be bound by it. He felt sure that Mr. Morley's views were exactly the same as his own in the matter. He sat beside him at the committee which sat in 1895, and they held exactly the same views, that in the interests of the public the areas should be reasonably dealt with. He thought any minister might say: "You may be sure that the Treasury will be fair," without any record being made of it. As to whether that might be thought to assume that the Postmaster-General would not be fair, he could only say that Mr. Forbes wanted something more, and that something appeared to be supplied by what he promised.

The Chairman: May I put it briefly like this. The heads of agreement say the Postmaster-General "may" do so. Did your undertaking amount in any shape to the pledge that the Postmaster-General must do so and should do so?—You may put it in that way that I thought the Postmaster-General should make such fair agreement.

"Shall" or "should?"—"Will;" that is what I understood by it; "will treat the company fairly in the matter of areas."

Is that not assumed already in the agreement?—I do not think it went beyond the agreement.

I put this concrete case. As I read the heads of agreement, it would certainly not have been incumbent upon the Postmaster-General to extend these areas during the present year of this rather acute crisis. The Post Office have extended them, and we gather from Mr. Lamb's evidence that they have extended them because they were pledged, not by the actual words of the agreement, but by these words, coupled with your assurance?—You may take it in that way. I left it in the hands of the Postmaster-General.

And therefore it would have been quite possible for the Postmaster-General to refuse the extension of these areas?—Certainly. It did not bind him to give an extension of every one.

Do you consider that the discretion of the Postmaster-General for the time being was absolutely unfettered, that your words did not bind him to grant these areas except under the heads of agreement as signed?—They expressed the sense in which I viewed that agreement.

Mr. Bartley: Do we understand really and truly that there was no verbal understanding outside this agreement in 1892?—I think not, unless you consider what I have said on this. That must be a matter of opinion.

Do you consider the Post Office only morally and legally bound by the terms of the agreement?—No. I think they were bound to interpret the agreement liberally and reasonably.

Further examined, Witness said he thought the Chancellor of the Exchequer agreed that there should be a liberal interpretation of the agreement. Mr. Forbes was reluctant to enter into the agreement because he considered they were giving up a really valuable part of their privilege, while at the same time the so-called concessions offered him were really necessary for the development of the business. When he (Witness) said that he was sure the Post Office would deal reasonably with the company in the matter of areas, he signed the agreement. It was the kind of thing which often happened.

Mr. Bartley: Must not the verbal arrangement have been very substantial to induce him to sign?—I cannot go beyond what I have said.

You wish the Committee to understand that this promise which changed Mr. Forbes's opinion as to signing the agreement, was so insignificant that it really did not amount to anything at all?—It did not amount to anything fresh beyond what was mentioned before the Telegraph Bill Committee.

Although it changed Mr. Forbes's opinion?—It caused him to sign it at the last moment. It did not change his opinion.

But we had it from Mr. Lamb that he absolutely refused to sign?—I do not think he flatly refused to sign.

Sir James Woodhouse: Did you regard what you said as any qualification of the agreement signed?—Certainly not. It would not be binding on this Government if they chose to repudiate it.

By Mr. Nicol: The company held the trunk lines, and gave them up, and they had to make some concession to the company. He considered that the reasonable assurance he gave to the company was in the interests of the public, as leading to the further development of the system.

Questioned by Mr. Colville: The agreement had led to an immense development of the telephone system. No application was made during his time by municipalities for telephone licenses. The first application of the Glasgow Corporation was in 1893.

By Sir James Howorth: He was not so sure that the telephone had increased in other countries enormously as compared with England. His impression was that it had not. The Commissioner at the Glasgow inquiry was of opinion that the rates charged in England were not excessive. He thought if the telephones were taken from the hands of the company they should be worked by the Post Office. He saw no objection in principle to the municipalities working the telephones, but he saw the greatest possible objection to having competing systems in the same area.

Mr. Bennett was recalled, and answered a few more questions, and the Committee adjourned.

The Select Committee on Telephones resumed its sitting on Tuesday last, Mr. Hanbury presiding.

Mr. J. Williams Benn, chairman of the Highways Committee of the London County Council, in reply to the Chairman, said that, generally speaking, no preference was shown to the County Council as regarded charges by the National Telephone Company. For exchange lines they paid the list charges.

The Chairman: What is that?

The Witness: That is £17 per annum for a five years' agreement. He then gave particulars of the other charges which the company levied upon the Council for their various lines.

Can you tell us how far telephone users in London have suffered financially owing to absence of competition?—Yes; but before I go into that question I should like to refer to the offer made by the New Telephone Company in 1892 to supply London with an up-to-date service. The company was already in successful operation in Manchester, under the title of the Mutual Company, and whereas it started in February 28th, 1891, with only 66 subscribers, after 13 months' working it had over 1,000 instruments in connection. With regard to the disappearance of that company, he submitted that the telephone users of London since that date had been mulcted to the extent of the difference between the charge of 12 guineas, which the New Company offered the service for, and the £17 which was paid to the National Company. If an average of 10,000 subscribers be taken from 1892 to 1898, the difference in price, to be reckoned only at £4 per annum, it would show a loss to the telephone users of London of nearly £300,000. Some 3,000 firms entered into an arrangement to to be supplied with a service by the New Company at the 12 guinea rate.

By Mr. J. Stuart: That was about May, 1892.

The Witness then referred to steps which the County Council had taken to ascertain whether the telephone users of London were satisfied with the existing service, and he said that in 1895, out of 2,500 subscribers communicated with, 1,305 were generally dissatisfied. They had just lately been sending round to ascertain what was the present position of those persons who were then complaining, and so far they had succeeded in dealing with 561 cases. They found that there were now satisfied with the service 8 persons, 53 had changed their address, 36 had discontinued through dissatisfaction, 245 were still dissatisfied for various reasons. The general summary of the complaints was as follows:—General inefficiency, 65; delay in getting connection, 213; indistinctness, 189; ringing off before conversation was finished, 196; failure to get connection on account of being engaged, 217.

Were they picked cases or taken haphazard?—Oh no, they were not picked cases by any means.

Can you tell me whether the London County Council have formed an opinion as to any substantial benefits which would be derived by their constituents from the working of the telephone service being in their own hands?—Speaking with a knowledge of the resolutions adopted last week at a conference between the Council and the local authorities of London, we say that if the Post Office will enter into the matter on the basis of honest and thorough competition, that there would be no necessity for the London County Council to take up this work.

But failing the Post Office doing as you desire?—Failing the Post Office, we could do very much better for London as regards price and efficiency than the National Telephone Company. We have advantages in regard to wayleaves, fire stations, and probably, through the co-operation of the local authorities, other public buildings, which would not be available to the National Telephone Company, and therefore, altogether, we could manage this thing more efficiently and cheaper.

That is a general statement—can you give us information as to where the particular advantages come in?—I think it would be better to refer you to the engineer for that portion of the evidence. From figures which were supplied by the engineer, I think it will be found that a telephone service can be provided for London at a charge of £10 per subscriber during the first five years, reduced to £9 afterwards, or possibly a smaller sum. Continuing, Witness said that on that basis they estimated that no charge would fall upon the county rate. It would be impossible for the Council to enter upon an undertaking that their license should terminate in 1911, without some provision that at all events their outlay up to that date should be forthcoming from the State. They would certainly ask for some guarantee that if their license terminated in 1911 they should receive back the structural value of their plant at all events. They would not ask anything for goodwill.

You don't think that the London County Council would put itself under the same terms with regard to purchase of their plant as the National Telephone Company?—No, I don't think in the interests of the ratepayers we could recommend such a course.

What is the shortest period the London County Council would think it fair to the ratepayers to undertake this work?—We could not undertake this work unless we had the whole of the life of the plant laid down.

And you put that at 40 yea s?—That is the average.

Do you expect to tap a different stratum of subscribers?—Yes. Our belief is that if the subscription in London were reduced to £10 or £9 it would induce a very large number of the class of small shopkeepers to take advantage of the telephone service.

When you speak of £10 you must recollect that there are two kinds of subscription in London—that for firms and that for private persons. Is your £10 for firms?—Certainly. We should be prepared to undertake private persons at a proportionate reduction. Continuing, Witness said that the position of the Council was rather different to that of provincial councils as regarded the control of the streets for the purpose of taking them up for the laying of lines, &c.

It would be within the right of a vestry to refuse to grant the County Council power to take up its streets?—That is so at present, but the London County Council would have to come to Parliament for powers, and it is quite possible that under such an Act, some provision might be made to remove that difficulty.

Would the London County Council ask for special powers, which are not given to its assumed competitor, the National Telephone Company?—I may say that if the London County Council were able to control the streets, as the National Telephone Company is, in conjunction with the Post Office, I don't think we should have any great difficulty in the matter.

Supposing the Post Office were to enter into the same agreement with you—as they have entered into with the National Telephone Company—as regards laying wires, would you require any fresh legislation?—Well, we should be able to proceed under that arrangement.

By Mr. Bartley: The National Telephone Company had paid substantial sums to the various competing companies which they had bought out. The purchase price of the whole 13 companies now represented by the National Telephone Company represented a capital of about 3 millions. He had analysed the figures, and had come to the conclusion that the constructional outlay of the company might be put down at £1,800,000, which left paper capital to the extent of £1,400,000, and a careful examination of the accounts of the company showed that the dividend to meet that paper capital had been almost entirely raised from London. Londoners were paying £76,000 a year in order to find the dividend on that paper capital.

Do you think that if competition were introduced into London we should get back the advantages which the National Telephone Company was anxious to prevent, by buying up the other companies?—Certainly.

By Sir James Woodhouse: You are of opinion that competition would be a good thing?—I say that under present circumstances it is a necessity.

You say that the local authority would be the best competitor?—Yes.

By Mr. Stuart: Where companies had been bought up in the country for considerable amounts, a reduction had been made in the charges, and London had had to pay the dividends of the company by its high rates.

The National Telephone Company is under no obligation to supply. —it may. In these figures that you have given us with reference to the London County Council, have you proceeded on the assumption that you should be under an obligation to supply as well as the right to supply?—Yes. We have regarded it as a great grievance in London that the National Telephone Company is not under any obligation to supply. We have received numerous complaints from persons wishing to have telephonic communication, but who the National Telephone Company refuse to supply, and we have in our figures taken it as an obligation to supply. The figures which he had placed before the Committee, continued the witness, only referred to the London County Council area, and he believed they could be very considerably improved upon if they included the National Telephone Company's area, which was much wider.

Replying to Mr. Cohen, Witness said that the figures he had given had not been approved by the London County Council in its corporate capacity. He believed, however, that they would be endorsed by the Council when opportunity offered.

By Mr. Colville: He had considered the question of the London County Council competing with the National Telephone Company, and he believed that if it had a license, it would be able to compete successfully at reduced rates.

Sir Henry Howorth: Your calculations were made upon the basis of not making any profit?—Yes; our idea is that we should serve the citizens.

Do you think that municipalities would be justified in embarking on a large scale on undertakings of this kind which are made for the needs of only a small portion of the community without a considerable profit?—I don't agree that the telephone service can be described as meeting the needs of a small class, because it must be evident that if the telephone is a necessary adjunct to commercial and business firms, then the advantages which result in an increase of business must extend to the carmen and the warehousemen. I say that the telephone service is necessary to business life of the country, and that it is in no sense a service which can be described as confined to the wealthy or business classes. Continuing, the witness said that unless the municipality was protected in the matter of telephone monopoly, the same way as it was protected in the case of gas and water undertakings, he considered it was their duty to step in and provide such a service. He had not contemplated the municipalities licensing the local authorities to undertake the work, as he thought it would be unfortunate to multiply the licensing authorities.

You say that the present company has refused to serve individuals —what inducement would there be for the company to refuse to supply, unless it was because they considered it would be too expensive?—The policy of the company, I believe, is that unless a sufficient number of persons in a district apply to be connected, they will not supply a single individual.

But surely you don't propose that the Municipality should introduce telephonic communication at a certain loss?—We say that in giving London a telephone service, we are bound to take the unprofitable with the profitable. Just in the same way as the Post Office serves districts which are distinctly unprofitable, we say that we must do this with the telephone for the convenience of London.

Re-examined by the CHAIRMAN: You propose that the London County Council should work the telephone service at such charges as would just pay the cost, and not that a profit should be made for the relief of the general rates?—That is so.

Replying to further questions, the WITNESS said the London County Council had not considered the question as to whether they would prefer to limit the working of the telephone service to their own area, or whether they would go outside.

Sir ALEXANDER BINNIE (chief engineer of the London County Council) was examined in reference to his estimate which he had prepared for supplying London with a telephone service. He explained that the estimate was based on the supply of the Council's area only, and not the London area of the National Telephone Company. Supposing they were to extend the service, the estimate would have to be slightly increased. The estimate was not based upon actual tenders, but upon prices which had been furnished to him by various manufacturers.

What is your estimate of a service for London?—£8 per subscriber, exclusive of the Post Office royalty.

But including the royalty?—Then I arrive at the figures just given by Mr. Benn—£10 to commence with, and £9 afterwards.

How long do you calculate that a license ought to run?—To render it remunerative, I agree with Mr. Benn that a license should run for 40 years. Continuing, WITNESS said that supposing the County Council were granted a license now which would expire in 1911, he reckoned they would have to make a charge of £15 or £16 per subscriber.

Mr. BENN said that there would be a lower charge for private persons than the £10 or £9 mentioned in your estimates for business firms?—All my calculations were based upon a rental of £10 and £9 respectively. Of course, we might be able to make a reduction for private persons within their own limited district, but that question has not entered into my calculations at all.

The Committee adjourned.

NEW PATENTS AND ABSTRACTS OF PUBLISHED SPECIFICATIONS.

NEW PATENTS.—1898.

Compiled expressly for this journal by **W. P. THOMPSON & Co.,** ***Electrical Patent Agents, 322, High Holborn, London, W.C., to whom all inquiries should be addressed.***

12,617. "Improvements in the means or apparatus for controlling and regulating electric motors." C. A. CAIUS WILSON. Dated June 6th.

12,631. "Tell-tale indicator for electric mast-head and side-lights of ships." A. R. TURNER. Dated June 6th.

12,636. "Improvements in electric switches." J. G. DIXON. Dated June 6th. (*Complete.*)

12,667. "An improved device for fitting reflectors, shades, globes, or the like, to electric incandescent and other lamps." C BARTENSTEIN. Dated June 6th.

12,670. "Improvements in the production or generation of electrical currents." J. POPPER. Dated June 6th.

12,673. "An apparatus for trimming electrotype and other blocks." J. I. GIBSON. (W. C. Dalbey, United States) Dated June 6th.

12,680. "Improvements relating to electric alternating current cable systems." F. CLOUTH. Dated June 6th. (*Complete.*)

12,699. "Improvements in or relating to electric transformers." J. J. BELLMAN and C. T. RITTENHOUSE. Dated June 7th. (*Complete.*)

12,731. "Improvements relating to electric telegraphs." A. MUIRHEAD. Dated June 7th.

12,754. "Improvements in apparatus for the generation and electrolytic application of electric currents." F. E ELMORE. (J. O. S. Elmore, India.) Dated June 7th.

12,763 "Improvements in and relating to apparatus for electro-therapeutic purposes." W. P. THOMPSON. (A. Maggiorani, Italy.) Dated June 7th. (*Complete.*)

12,765. "Improvements in or relating to the electrolysis of liquids and apparatus therefor." W. P. THOMPSON. (M. Hazard-Flamand, France.) Dated June 7th.

12,774 "Improvements in electric railways." G. F. REDFERN. (B. J. Falk, United States) Dated June 7th.

12,784. "Improvements in electrical rheostats and resistances." L. J. STEELE. Dated June 8th.

12,810. "Magnetic measuring instruments." J. RUSSELL. Dated June 8th.

12,815. "Improvements relating to electrical motors." R. C. JACKSON. Dated June 8th.

12,825. "Improvements in obtaining metals from their fused ores oxides, and salts by electrical action." J. B. DE ALZUGARAY. Dated June 8th

12,829. "A new or improved apparatus for electrically signalling on railways" R MUSCHAMP. Dated June 8th. (*Complete.*)

12,839. "Improvements in electric glow lamp fittings." SIEMENS BROS, & CO., LTD. (Siemens & Halske, Aktien Gesellschaft, Germany.) Dated June 8th.

12,840. "Improvements in electric glow lamps." SIEMENS BROTHERS & CO., LIMITED. (Siemens & Halske, Aktien Gesellschaft, Germany.) Dated June 8th.

12,841. "Improvements in contact rings for electric glow lamps." SIEMENS BROTHERS & CO, LIMITED. (Siemens & Halske, Aktien Gesellschaft, Germany.) Dated June 8th.

12,855. "An electrical indicating apparatus for automatically denoting the position of ships' and other doors and for like purposes." G. HILL. Dated June 8th.

12,860. "Improvements in telegraphy by means of electric light." K. ZICKLER. Dated June 8th.

12,866. "Improvements in electrical circuit-controllers." H. H. LAKE. (N. Tesla, United States.) Dated June 8th. (*Complete.*)

12,877. "Improvements in electric arc lamps." P. SPIES and S. ROBERTS Dated June 9th.

12,890. "Improvements in the method of and means employed for connecting the guard wires of electric cables." R. BOSTOCK and F. A. CHEETHAM. Dated June 9th.

12,893. "Improvements in safety devices for electrical circuits." L. J. STEELE. Dated June 9th

12,897. "Pliable support for electric incandescence lamps or other light articles." J. DUGAILL. Dated June 9th.

12,925. "An improved device for holding and supporting telephone 'receivers' and for automatically operating the switch lever." A. BACK. Dated June 9th.

12,926 "Improvements in or relating to electric arc lamps." A. J. BOULT. (M. Baumer, Germany.) Dated June 9th.

12,929. "Improvements in or connected with telephones." F. W. GOLBY. (R C. Stempel, Germany.) Dated June 9th.

12,968. "A new or improved magnetic controlling device." H. EDMUNDS. Dated June 9th.

13,010. "Improvements in electric arc lamps." THE BRITISH THOMSON-HOUSTON COMPANY, LIMITED. (R. Fleming, United States.) Dated June 10th. (*Complete.*)

13,011. "Improvements in clutches for electric arc lamps." THE BRITISH THOMSON-HOUSTON COMPANY, LIMITED. (H. C. Spinney, United States) Dated June 10th. (*Complete.*)

13,012. "Improvements in caps for enclosed electric arc lamps." THE BRITISH THOMSON-HOUSTON COMPANY, LIMITED. (C. E. Harthan, United States.) Dated June 10th. (*Complete.*)

13,020. "Improvements in construction of induction coils in detachable sections." W. J. LE COUTEUR. Dated June 10th.

13,021. "A combined portable manual-power dynamo and accumulator." W. J. LE COUTEUR. Dated June 10th.

13,037. "Improvements in electric glow lamps." THE SPIRAL GLOBE, LIMITED, and B. C. E. PARKER. Dated June 10th.

13,080. "Improved signal or alarm for tramcars, yachts, electric launches, and like purposes." A. H. WORMALD. Dated June 11th.

13,116. "Improvements in conductors for incandescent electric lamps." O. IMRAY. (Carl Auer von Welsbach, Austria.) Dated June 11th.

13,121. "Improvements in electrical accumulators." H. W. COBB. Dated June 11th.

13,137. "A new or improved apparatus or tool holder for carrying carbons or electrodes for use in electric welding, brazing, and the like purposes." G. W. DE TUNZELMANN. Dated June 11th.

13,144. "Improvements in apparatus for electrically controlling engines, electric-motors, and other machinery." W. H. HARFIELD. Dated June 11th.

ABSTRACTS OF PUBLISHED SPECIFICATIONS.

Copies of any of these Specifications may be obtained of **Messrs. W. P. THOMPSON & Co., 322, High Holborn, W.C.,** *price, post free,* **9d.** (*in stamps*).

1897.

19,118. "Improvements in dynamo-electric driving apparatus especially suitable for propelling vehicles." P. L. GOLDSCHMIDT. Dated August 18th, 1897. In this electric driving apparatus for motion of the armature, and of the field magnet is respectively transmitted directly to two shafts, in such a manner that the number of revolutions is reduced, in consequence of the relatively independent motion of the field magnet, and of the armature; so that intermediate and differential gearing can be dispensed with, and the shafts rendered independent of each other. 2 claims.

18,628. "Improvements in portable electric primary." O. H. COLE. Dated August 11th, 1897. This relates to those batteries where the electrodes may be immersed or removed from the exciting fluid by reversing the battery. The tubular carbon electrode is formed with circumferential corrugations and fitted with an end projecting platinum contact point. The cell is moulded entire, with one opening for placing and removing the zinc electrode and the exciting fluid. The carbon is fixed within one end of the cell as the latter is moulded; the rubber entering into the corrugations of the carbon and holding between an inner ledge and the cell end, and hermetically closing around the projecting platinum point. The cell is thus moulded with projecting bosses for the respective terminals. There is also a means for connecting the terminals and circuit connections. 2 claims.
